NOTICE OF ASSESSMENT.

KEYSTONE CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Amador City, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22d day of August, 1892, an assessment, (No. 3) of One Dollar ($1) per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room 43, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of September, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 18th day of October, 1892, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. H. ISHAM, Secretary.

Office—No. 310 Pine Street, Room 43, San Francisco, California.

CORRESPONDENCE SOLICITED

A Pneumatic Railroad Signal Apparatus.

On a place like the Oakland mole, where they have a complete electric and air-compressing apparatus for operating the block-signal system, it is very easy to arrange for automatic signals for crossing or passing trains, but at line. By the mechanism and system devised the passing train furnishes the power to operate the signal, which can he placed at some distance from the place where the power is applied. This is accomplished by the use of a pneumatic track-instrument, which consists substantially of a lever acting upon a diaphrsgm which fits within a chamher, the produced by any diaphragm movable within a chamber and a suitable conoection between the diaphragm and the wheels of a passing train, either directly or hy depressing a portion of the track itself as the train passes. Tn operate a signal or bell to protect a road crossing they use three track-instruments, two contact instruments, and an

Fig. 1

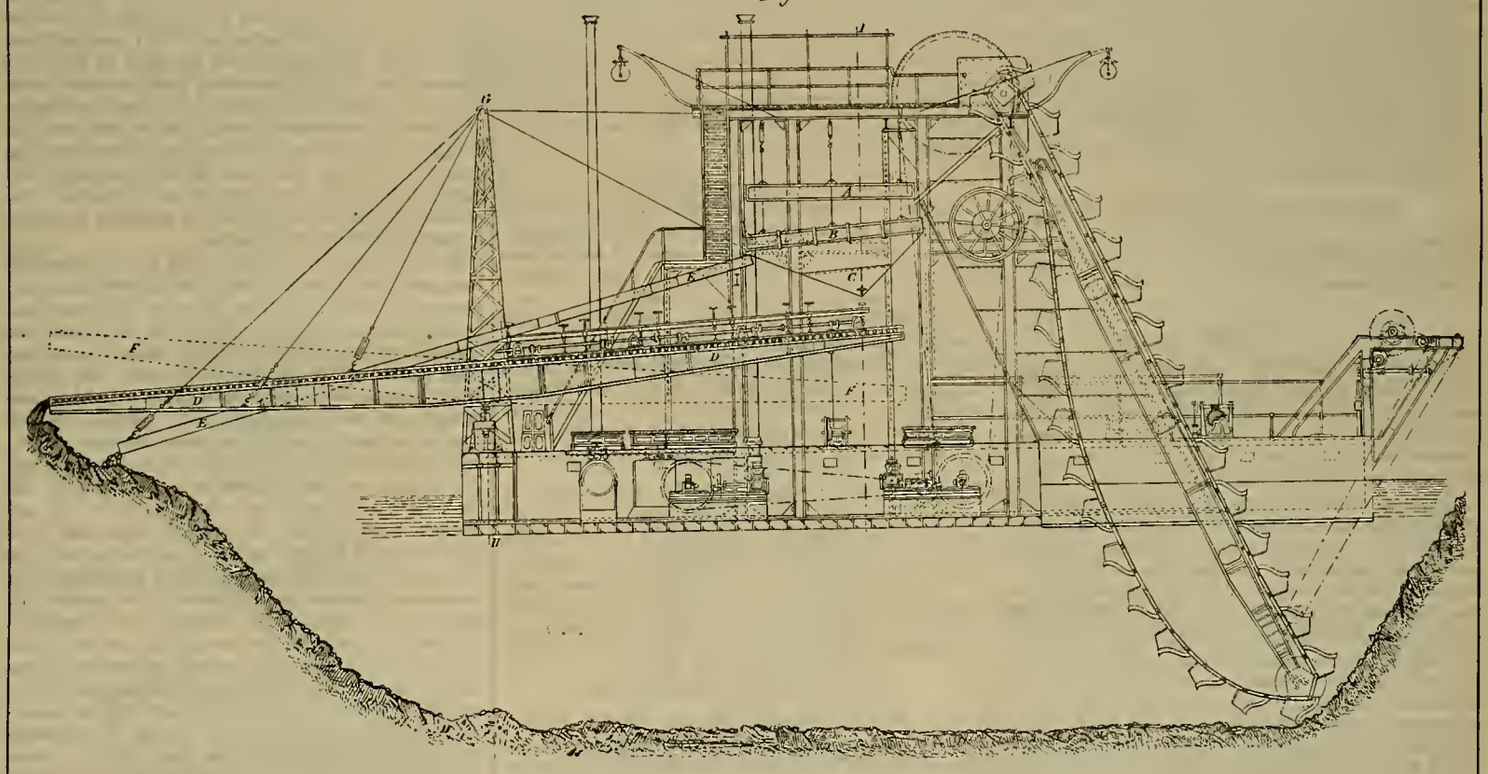

Fig. 2

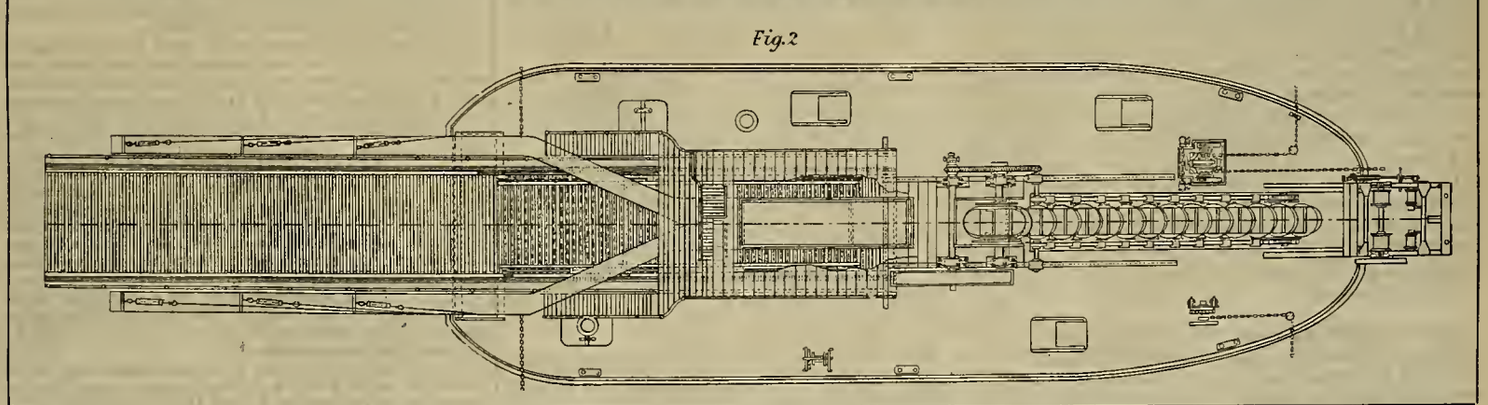

FIGS. 1 AND 2—SECTIONAL VIEWS OF DREDGE FOR AURIFEROUS RIVER BEDS. (SEE PAGE 155)

stations, crossings or tunnels way off on the main line this cannot readily be done without the aid of a man. Wm. W. Slater and Harry O. Barnes, electricians, in the employ of the Southern Pacific Company, at Oakland mole, have recently invented and patented a pneumatic electric-circuit-controlling and interlocking apparatus which dispenses with all electrical circuits in the rails and all underground wiring. This they have applied at the Fourteenth street crossing of the narrow gauge line in Oakland, at the San Fernando tunnel, and other places on the main lever being acted upon by the wheels of a passing train so as to depress the diapahragm within the chamber as each wheel passes over it, and produce a vibration or pulsation of the air through a pipe to a point where the electro-pneumatic mechanism is to be actuated by this column of air. The diaphragm and lever are immediately returned by a spring after each depression by the wheels, so that there will be a constant reciprocation and corresponding pulsation of air in the conducting pipes while the train is passing. This movement or pulsation of the air may be electro-pneumatic instrument. Tbe hell is kept ringing while the train is passing, and only stops when it has entirely passed. It is sometimes necessary to give an engineer a signal at certain points to look out for danger or for other purposes. In such a case the mechanism opens a valve in an air-supply pipe and sounds a whistle which is situated near the track so that the engineer cannot fail to hear it. For making the necessary pulsations to operate the mechanism only about one-quarter of an inch of movement is necessary, the lever working with that.

Comment.

As is generally known, the larger electric companies in the East have formed a consolidation of interest, with a capital of fifty millions of dollars. The new General Electric Company has absorbed the Edison and Thompson-Houston system, the latter with its associates representing $39,000,000 and the Edison about $11,000,000. This new company has virtually absorbed most of the outside corporations, with a few exceptions. The big company still has a fight on its hands with some of the other companies controlling other valuable systems. Electric lighting has become so common and general that it has become a question of efficiency and cheapness, as to which system shall prevail. It would seem that the long-distance system, if at all perfect, must necessarily leave a direct system in the lurch. Moreover, in the long distance transmission it is absolutely essential that the alternating system should be used, as the cost of the direct current would be out of the question on account of the enormous cross-section of copper which would be required for the transmission of the quantity necessary. As the horsepower shows the consumption of coal per hour, those plans which require more power than others can not financially cope with cheaper machinery. The general outlook of the business is that it is only a question of time when the existing difference between large territorial agencies will be settled, resulting in a powerful monopoly as great, if not greater, than that of the telephone. The result of this will be the cutting up of small establishments which have made it a business to live off of the already acquired rights and patents of others, but have existed solely from the fact that the larger companies have never fully and thoroughly adjudicated their respective patent rights.

Cholera has been for some weeks epidemic in Russia, and has got to Amsterdam, Antwerp, Bremen, Paris, Havre and other European cities. In Great Britain there have been a few deaths in London, Glasgow and Swansea. On Wednesday it came to New York in a steamer from Hamburg, 22 deaths having occurred on the voyage over. The vessel is under strict quarantine, of course, but it is evident we are in imminent danger of a visitation from this plague. In San Francisco, steps have already been taken to "clean house," and a house-to-house inspection has been commenced. Strange to say, the Chinese were the first to take alarm, and an order from their consul set the Mongolians at work cleaning up Chinatown. California has a great advantage in being on the further side of the continent, but it is remembered that when cholera was last prevalent in the United States, we did not escape. What once happened may easily happen again, and it is the part of wisdom to make preparation by establishing the best attainable sanitary conditions. From its situation directly upon the ocean and in the very teeth of the daily ocean breeze, San Francisco has less to fear than the interior where it is hotter and where general sanitary conditions are not so good. It was in the Sacramento valley, notably in the cities of Sacramento and Marysville, that the plague raged most fiercely at the time of its former visit. It was in 1850, the second year of the cholera invasion in the United States, that the plague followed up the army of immigrants which on the 1st of July was scattered for 2000 miles along the route from St. Josepb, Missouri, to Sacramento. It reached the latter city about September 1st, and remained with it until November. At San Francisco there were a few cases, but the disease did not become epidemic, while in the higher regions east and north of the Sacramento there were no cases at all.

The World's Fair Commissioners are beginning to realize that it is no longer an easy matter to collect gold specimens for exhibition purposes in this State. When the miners get them out, they want to sell them and get the money, and the commission cannot afford to buy them, consequently, our exhibition of gold ores is not apt to be anything very striking or wonderful. The State Mining Bureau at one time had a fine collection, but they were stolen from the museum, and those added since do not equal them in value or beauty. Of course, some very good specimens could be obtained from private collections, but the fact is, miners fail to see how they are individually benefited by a display of specimens unless they have a mine or stock to sell. People look at them and say, "How pretty," and that is the end of it. It is really the gold ores which show no gold from which the bulk of the product of the State comes.

A vessel arrived in this port on Monday with a cargo of 1450 tons of coal from Coal Bay, Cooks Inlet, Alaska, the first cargo of any size ever brought from that Territory. There is said to be a plentiful supply of coal in those arctic regions, but it is only of late that it was developed. It is a very important thing for this State, which is poorly supplied with coal, and our largest supplies come from foreign sources at present. A plentiful supply from American soil, with no duty to pay, will have an important bearing on industrial affairs in this city and throughout the State. Should the new mines prove as productive as is claimed, in a very short time lines of steam colliers will be established between Cooks Inlet and this port.

In the article on "Tests for Water," in the PRESS of last week, the test given for gypsum, Mr. C. H. Aaron tells us, is really a test for sulphuric acid or any soluble sulphate. Many waters contain sodium, magnesium or iron sulphate, while a few contain free sulphuric acid. All such would be judged to contain gypsum, according to the test in question, which is therefore misleading in that regard.

Recovering Gold from Solutions.

There are many complaints from people who have been working or experimenting with the MacArthur-Forrest Cyanide process that they are unable to obtain the results expected, and that they are unable to obtain a satisfactory explanation for the failure. There seems to be no difficulty in getting the gold into solution, but there is a good deal of difficulty in getting it out. The zinc shavings, used by the MacArthur-Forrest people for precipitating the gold, do not appear to accomplish their object as well as they ought. One man finds gold precipitating wherever the solution flows. Another finds that the gold in the original ore has been all practically dissolved out, and the tailings show little trace, but he does not get the gold from the solution and does not know where it has gone. It is the duty of the chemist of the works to find this out, and if he cannot, then he is a poor chemist and should quit "cyaniding" and go to sawing wood. It must be there somewhere and ought to be found.

But it is exasperating to the mine-owner to find his gold taken from the ore by "chemicals" used for the purpose, and then not be able to find where it has gone. If it all goes into a solution from which only half can be recovered, why the process can hardly be considered a complete success. At any rate, the precipitating substance is not, and something better will have have to be devised before the system becomes what it is claimed to be.

Some of the men using the process find a mysterious white powder precipitated, the nature of which is rather a conundrum and should be investigated by some competent person, as, if it is auriferous, it may account for a part at least of the loss, being perhaps washed away by water when the gold is collected from the boxes, or carried, suspended in the solution, to the storage tanks, etc.

Foundry Notes.

A New Departure at the Risdon Iron Works.

The Risdon Iron Works of this city have of late been making a specialty of machinery and equipment for electric railroads, of which many are now being built in this State. The equipment includes engines, boilers, condensers poles, pole-brackets, switches, chairs, etc. The Risdon works have equipped the San Francisco and San Mateo electric road with 1000-horsepower engines; the Metropolitan electric road with 500-horsepower; Oakland, Haywards and San Leandro, 300; Santa Cruz, 200; Stockton, 600; Capital Gas Co., Sacramento (light and power), 500; San Diego road, 250. They have a contract now for a 500-horsepower engine for the East Oakland electric road; and one for the Oakland, San Leandro and Haywards electric road for 500-horsepower Ball engine and Heine boiler.

Some of the engines furnished are Corliss and others Ball high-speed engines. For many of the roads mentioned, the works furnished the entire equipment of chairs, switches, poles, etc. The poles have been specially designed and patented by the Risdon Rorks.

They are also making a great many Bryan mills, for ore, and a number are being sold to people who have been using them for some time. The Bryan mill is intended for use in place of stamps, and is a modification of the well-known Chile mill arranged for the continuous wet-crushing of either gold or silver ores. It consists of an annular mortar containing fixed segmental steel dies arranged in the path of its three crushing rollers, which, in a five-foot mill, are 44 inches in diameter, seven inch face, weighing 3500 pounds each, whose axles are fixed in them, and journaled in a central revolving table, attached to and driven by a belt pulley, making a very direct application of power. A four-foot mill has a similar arrangement of dies, but smaller rollers, weighing 1200 pounds each, exclusive of the drum, which rests on their periphery, adding to their weight and driving them by friction. The crushing weight of the rollers can be increased as desired by loading the tank driving pulley.

There mills have an unusually large area of screen surface, permitting it free discharge of all pulverized ore, thus preventing sliming. They are excellent gold amalgamators, and many prefer them to stamps, for the reason that they are portable, quickly and cheaply erected, require less power and a less first cost than stamp mills. The Risdon Works manufacture complete gold and silver mills in connection with these pulverizers, and, if required, furnish them in sections for packing over mountain trails. In its operation of the mill the pulp runs around the mortar next to the screens on a rapid current of not less than 300 feet per minute; but toward the center insides of the rollers the movement of the pulp is much slower, and as the gold is liberated from the matrix it falls to the eddy side of the current and in practice is found amalgamated in mass around the cone on the center of the mortar. By this action of free gold is not subjected to the continuous grinding of the roller on the mass of pulp, and nearly all the gold in the ore, fully 80 per cent, is retained in the mortar. The ore does not slime, and the sand and pyrites are left of uniform size and in good condition for concentrating. The clean-up of the mill, owing to the simple arrangement, is done with great ease. Many of these mills are now in operation on this coast, in Virginia, Georgia, Mexico, Tasmania and Australia.

The Risdon Works have lately made a radical departure in their line of business by going into the agency for eastern concerns very extensively. They now have as large a line of special goods as is carried by any ordinary commission-house here, and have a special building, opposite the works, where these things are kept. The articles include engines, pumps, blowers, gas engines, water-gates and all manner of small things. In filling their contracts for mining, milling and other machinery, they can often take from their consignments small machinery, etc., to advantage, whereas unless they were able to do this, the entire work would go East. This step has been taken because the labor strikes and rate of wages paid have made competition in certain lines simply prohibitory. If men want engines or other machinery made to order, they can get them at the Risdon; if they want cheaper articles, ready-made, these can also be furnished, if desired, by the same works.

They propose to introduce here the new improved Hill-Wheelock engine which is similar in design to the Corliss except the valves, and can be run 125 revolutions a minute, and be belted direct to a generator, doing away with countershafting, pulleys, etc. In this engine the percentage of clearance is down to 1½ per cent, and the makers are prepared to guarantee that the engines will develop a horse power upon 13½ pounds of dry steam per hour. This is five pounds less than the makers of the best engines are willing to guarantee, and if the guarantee can be faithfully carried out there is no reason why the engines should not be extensively adopted. There is every reason to believe that the Risdon will have a large run on this engine. For the purpose of ascertaining if the representations are correct, Mr. Dorward is now East investigating, and his reports to date are very satisfactory, the engine at Worcester having been run three years without perceptible wear.

Dredging for Gold.

We never had very much luck in dredging the California rivers for gold, although there is supposed to be a great deal in the beds. Still, such dredges as we have put in operation here, while they have brought up sand, gravel and stones, did not bring up gold enough to pay expenses. We have even tried to dredge outside the surf at the gold bluffs up the coast and made a failure of it there, as well as in the rivers. A dozen different river-dredging enterprizes have been started in this State, but there were no returns from any of them. It is different in some of the Australian rivers, where the dredging machines have been in operation for years. There the machines have enabled the companies to pay dividends. In some other parts of the world, too, river-dredging for gold has paid. We give herewith illustrations of a dredger constructed by Messrs. E. F. Lacour and Thomas Figee, of Haarlem, for the excavation of gold-bearing soil in the River Orba, near Alexandria, Piedmont, and which is of interest as a step in the direction of dealing on a large scale, and at low cost, with alluvial deposits containing but a small percentage of gold, and which, therefore, could not be economically treated in the ordinary way. The machine comprises not only a dredger, but also a washing plant for concentrating the dredged material, and at once getting rid of the bulk of the debris.

Fig. 3.

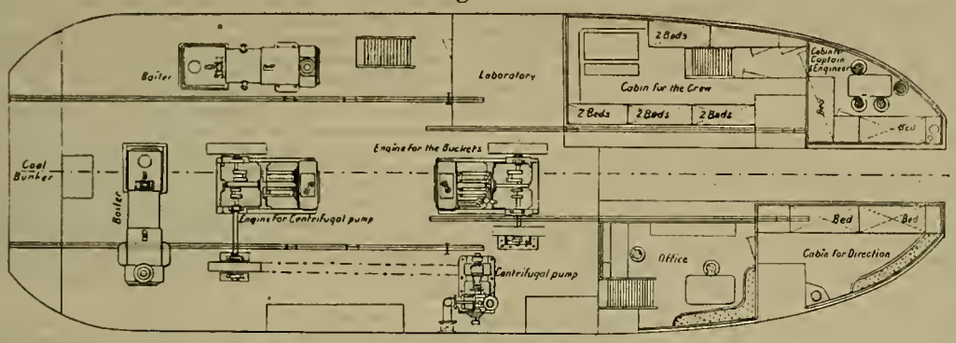

FIG. 3.—DECK PLAN OF DREDGING APPARATUS.

Fig 4

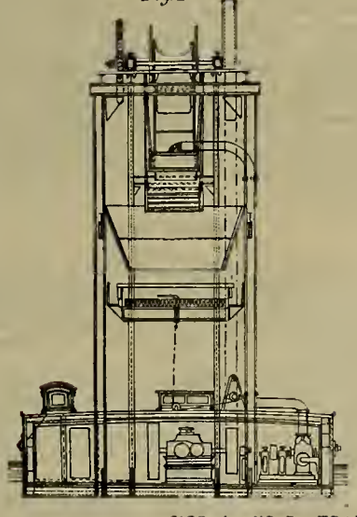

Fig 5

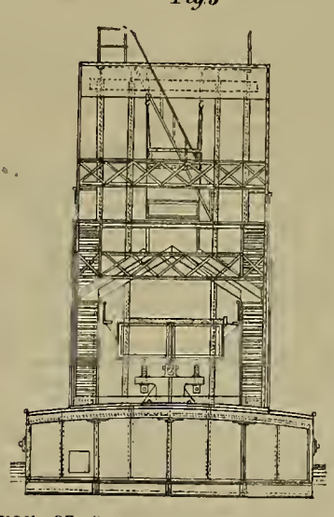


FIGS. 4 AND 5.—TRANSVERSE SECTION OF DREDGER.

Referring to the longitudinal section and plan (Figs. 1 and 2) and to the two transverse sections (Figs. 4 and 5) it will be seen that the whole plant is mounted on a flat-bottomed barge of shallow draught, which, in addition to affording cabin accommodation for the crew, also contains a laboratory and cabin for the metallurgists in charge. The dredging apparatus is of the ordinary bucket-and-ladder type, and requires no special description; it is driven by an independent engine, and its arrangement will be at once understood on reference to the views above referred to.

The dredged material is delivered by the buckets on to the screens at B, the frame B, which has a jigging motion imparted to it, containing three screens of different degrees of fineness, placed one above the other. Thus the top screen is a strong one, having meshes 1-6 inch square, which receives the shock of the material falling from the buckets, while the second and third screens have meshes 0-4 inch and 0-16 inch square respectively, the latter screen being of steel wire gauze.

Above the screens is a water trough A, which receives the water from a centrifugal pump capable of delivering 154,000 gallons per hour, and driven by an independent engine. The bottom of the water trough is perforated all over with holes one-fifth of an inch in diameter, and through these the water falls in a shower on to the materials on the screens. By the action of the screens about four-fifths of the dredged material is separated from the rest, and passed on to the inclined pipe E, through which it flows, mixed with water, to be again deposited in the river bed a sufficient distance in the rear of the dredger. The screens are also provided with a special arrangement which prevents any large pieces of gold from passing off to waste with the lighter debris.

By the arrangements just described about four-fifths of the dredged material are, as we have already stated, at once got rid of; the remaining fifth passes through the finest screen and falls into the hopper C. At the bottom of this hopper is a distributing apparatus, which mixes up the sand and water and causes a steady stream of the mixture to fall through the discharge opening in the bottom on to the sluice D. This sluice is a kind of shallow canal 82 ft. long by 9 ft. 10 in. wide, the bottom being crossed by grooves or flutings, and it is supported by an iron frame at the stern of the vessel, the support being hinged in two directions, so that the level of the sluice can be adjusted either laterally or longitudinally. The former adjustment is necessary to counteract any list or cant which the vessel may have to port or starboard, which cant, if uncorrected, would interfere with the maintenance of a uniform depth of flow over the whole width of the sluice, a uniformity which is essential to its proper working. The lateral adjustment of level is effected by screws, while longitudinally the inclination of the sluice is regulated by a chain led from a winch placed on the deck (as shown in Fig. 1). This sluice can, when required, be inclined so that its inboard end is the lower of the two, as shown by dotted lines; the use of this we shall explain presently.

Referring to Fig. 1, it will be seen that over the upper half of the length of the sluice there extends a shaft; this shaft carries eccentrics which impart motion to a series of distributing rakes, these rakes acting on the mixture of sand and water as it flows over the sluice. The teeth of these rakes also retard the flow of the water, the effect being that the heavy gold settles down in the grooves while the sand passes off with the water over the tail of the sluice. The rakes also—practically covering, as they do, the upper half of the sluice—serve to protect the deposited gold.

When a sufficient quantity of gold or gold-bearing sand has been collected in this way the dredging is stopped, the sluice altered into the position shown by the dotted lines, the rakes are lifted, and the material deposited in the flutings is raked out and washed down a pipe into the laboratory for subsequent treatment. After working for some five days with a dredger of this class, raising about 1,500 tons of stuff per day, it is found that the concentrated gold-bearing material taken off from the sluice into the laboratory amounts to but about 4 cubic yards. Altogether the machine is one which has been well designed to carry out a large part of the work of concentrating alluvial gold-bearing material with a minimum amount of manual labor. Perhaps with a machine something like this we might get something out of our own river beds. The plan differs somewhat from any we have tried, for we have treated the whole bulk of the material, while this machine gets rid of a good deal at once.

Personal.

MR. JOHN. T. EVANS, the assayer and chemist of this city, is quite seriously ill with inflammation of the bowels.

JAS. W. MICHAEL has sold his interest in the Jim Blaine mine in the White Hills, A. T., to California parties for $1,000.

ED. HUME has taken a position as superintendent of development work in the Parker mine on Muletown mountain, Shasta Co.

THOMAS STEEN has struck a four foot vein of high-grade ore in his tunnel on the Jennie mine in Weaver district, Arizona.

D. B. LYMAN, Superintendent of the Con. California and Virginia mine, who has been at Santa Cruz for a short time, has returned to the Comstock.

MR. AUG. J. BOWIE, the mining and electrical engineer, author of "Hydraulic Mining in California" has gone to Cripple Creek, Colorado, on mining business.

THE State Mining Bureau has sent to Sacramento about two tons of mineral and ore specimens and over a dozen large photographic views of early California mining scenes, to be used in the historical exhibition in the State fair.

WALTER BROOKS, a mining man left on the last steamer for Mexico to assume the superintendency of the Theresa Mining Company's plant at Rosario, vice N. Nichols. He was accompanied by Captain Stockmeyer, one of the directors.

ALEXANDER MCCAW, Superintendent of the Integra, Quicksilver Mining Co., of Trinity Co., has made arrangements with Holt & Gregg to burn 700,000 brick on the company's ground. This brick will be used for the furnaces. The mine is in the Altoona quicksilver belt.

R. I. DUNN, of the California State Mining Bureau, returned last week to Yreka, from a trip to the Salmon River country. Mr. Dunn is now visiting Humbug and Klamath river in the Honolulu district, with intention of going to Henley, Siskiyou mountain and Upper Klamath mining districts.

RICHARD BRADLEY, Secretary of the Cortez Mining Company, informs the Austin *Advocate* that at present there are 15 men employed in and about the mine prospecting, but not extracting any ore. The report that the mill was to start soon is a mistake. It will remain closed down until silver advances.

A. J. ROULSTONE, of East Oakland, metallurgist, left last week for Stoddard, Arizona, to take charge of the smelting department of the Agua Fria Copper Company, a New York corporation, in which U. S. Senator J. P. Jones is largely interested. Mr. Roulstone has a well-earned reputation of being a skilled and experienced copper expert.

IT has been decided after consultation between the superintendents of the Savage and Norcross companies that each company will continue to work through its own shaft, instead of one, as heretofore contemplated. Considerable prospecting is being carried on in these two mines, and the management desire to push it ahead as rapidly as possible.

THERE are 3,194 men employed in the collieries of Vancouver Island, British Columbia, and the output for 1891 was 1,029,097 tons, compared with 678,140 tons for the previous year. During the thirty-three years ending December 31, 1891, £10 622,625 worth of gold was yielded in the province. The want of facilities for shipping ores has retarded the progress of the mining districts.

MR. B. L. MCLAIN, who arrived from Spring City last week, tells the Winnemucca Silver State that the experimental test made with the cyanide process has proved satisfactory, and works for the reduction of Paradise tailings are fast approaching completion. He expects to handle the tailings for about $1 50 per ton. There are about 3000 tons of tailings on the ground, which will give the process a very practical test.

W. E. DENNISON has sued E. W. Chapman for 12,500 shares of stock in the Taylor mine in El Dorado county, or for $62 500 claimed to be their value. He also demands $2500, alleged to be due on account of his salary as superintendent of the mine. Dennison claims the shares of stock under a contract as compensation for certain negotiations by which the defendant acquired 50,000 shares of stock from E. S. Chester and W. E. Straut, who were the original owners of the mining propeety.

Mr. A. J. COLQUHOUN, representing that very influential and wealthy corporation, the Gold and Silver Recovery Syndicate of Glasgow, Scotland, of which so much has lately been heard, has decided to make Golden his headquarters during the few weeks he will be in British Columbia. The chief object in doing this is the fact that the town is on the main line of the C. P. Railway, central to all the mining camps of East Kootenay and more easily reached by rail or boat from those of any other district than the many towns west of us.

Mechanical Improvement.

The careful observer who looks back a few years cannot but realize the great changes that have been made in that time, not only in the art of wood-working, but in the machinery used for that purpose; that the earlier machines invented and designed for that purpose were in many cases rude, as compared with modern machinery, and, while they answered the purpose for the time, yet in comparison with modern machinery they were the basis only upon which the latter are constructed.

In building the first machines for planing, the principal idea of the inventor was to construct a device for reducing lumber to a uniform thickness, with less labor than performing the same by hand. Various devices were attempted in England for that purpose before the rotary cutterhead was introduced. The first machines had nothing in the way of an automatic feed. The stuff was pushed over a table by hand, much in the same manner as the modern buzz planer or jointing machine, yet it established the fact that rotary cutters could be used for that purpose.

There is nothing to show that any attempts were made to introduce an automatic feed with success until William Woodworth made his invention, which was patented in this country in the year 1828. There is no doubt but Woodworth was the first in this country at least to combine with a rotary cutter a positive automatic feed; and from the fact that it was able to plane one side of a board, and reduce it to a uniform thickness by an automatic feed, it was not only considered one of the wonders of the age, but intelligent men were found who predicted that it was destined, if brought into general use, to ruin the trade of the carpenters.

Although William Woodworth is generally credited with the invention of the planingmachine which still bears his name, such was not really the case, for the rotary cutterhead, which is the most important part, had long been in use and was well known in England, yet this formed the true basis of his invention, which was simply the use of an old and well-known device in combination with another. The claim in his original invention shows this to be true. It says: "I claim the combination of the feedingrolls with rotary cutters, etc." Therefore, the original invention was simply a combination of two devices, which produced a new result, and the first machine was simply intended to plane one side of a board and at the same time reduce it to a uniform thickness. The addition of the matchers was another invention of which the original machine formed the basis. They were not added till some time after his first machine was in successful operation. Then a patent was granted in which the first claim was repeated and another one added covering the use of the side-cutters, still in combination with the feedingrollers, which constitute an automatic feed.

The improvements upon the original machine during the life of the original patent and its several extensions were few, from the fact that the patent was controlled by a monopoly, which effectually shut out everything in the way of improvements. Not until after the year 1856, when the patent finally expired and became public property, were any improvements to speak of added. The present modern planingmachine with all its improvements, which has brought it to its present state of perfection and efficiency, were made since that time. But these improvements have not been made by any one man; different manufacturers have studied the wants and requirements of woodworkers, and have each added improvements until it would appear that perfection was nearly attained; and if William Woodworth could come back to this earth and look upon the modern planer and matcher, feeding the lumber at the rate of from 80 to 100 lineal feet per minute, he would scarcely recognize this as the results of his invention of 65 years ago.

What is true of the planing-machine is equally true of all other machines used in modern wood-working establishments. Skilled workmen have grown with these improvements, and the operator of 40 or 50 years ago, although he may have been considered at that time a skillful one, would be but little, if any, better in the mill of to-day than a green hand.

It is, therefore, well that these improvements have come gradually, for if it were possible that the first planer or molding machine had possessed all the improvements of the modern machine, it is doubtful whether they would have been successfully introduced, for the reason that much of the work performed by the modern machine was not called for at that time, and it is doubtful if men of sufficient skill could have been found to operate them. The band-sawmill is a practical illustration: Although the bandsaw has been in use in France for many years, and was, comparatively speaking, an old device, yet the failure of many of the first bandmills in this country was not so much from certain imperfections (since corrected) as from the lack of skillful operators to run them. Even among the best circular-sawfilers and sawyers, very few were found able to successfully manage a bandsaw until they had made themselves familiar with the new practice.

The circular sawmill passed through the same ordeal upon its first introduction. While many expert filers and sawyers of the uprightsaw could be found, it was several years before a sufficient number of men were found who could successfully run a circularmill and keep the saws in perfect order. But as soon as a sufficient number of sawyers became educated in its use, the circularsawmill entirely superseded the upright. The modern gangmill is about the only style of reciprocating saw at present in use, and only the fact that much thinner saws are used, and thereby a saving in lumber effected, has kept the gangmill from disappearing long ago.

Now that the band sawmill has become a success, and skillful men are fast being educated in its practical use, there is no doubt but history will repeat itself, and both the circular and gang will in time give way to their successful rival for the manufacture of lumber from the log. The advantages in economy in favor of the bandmill are fast becoming apparent. The thin saws used by the band can never be aproached by the circular. While the average circular makes a kerf at least one-fourth inch, the band only requires about one-half that amount. The saving of one-eighth inch in the saw kerf amounts to enough to make a great difference in the product of a days sawing. Still, the success of the bandmill will depend upon the skill and dexterity of the filer and sawyer. The time is approaching fast when the faithful old circular, like many other devices, must give way to a successful rival.—Homo, in The Wood-Worker.

Coast Industrial Notes.

THE Wieland Brewery Co., of this city, are building an ice storage house in Tucson, Arizona.

OF the 580 men employed at Mare Island Navy Yard, 200 are at work on the monitor Monadnock.

THE sugar factory at Alvarado will commence handling beets about the end of September. The growers are fearing an early and wet winter.

THE Veterans' Home at Yountville is now lighted with gas made with the patented apparatus manufactured by the Badlam Bros. of this city.

A CHICAGO syndicate is investigating the country about Shasta with the intention of establishing a paper manufactory to be run by water power.

STOCKTON is to have the largest macaroni factory on the coast. It is to be built by a San Francisco capitalist, and the intention is to supply the Pacific slope with the product.

PHIL DECKER, one of the proprietors of the Portland Smelting and Refining Works, was in Redding last week. His business is buying ore and he wishes to purchase ores of Shasta county.

A PLAN is being arranged at Santa Rosa to build a boulevard between that place and Petaluma. If the new road is opened, the long-talked of electric road between the two places will undoubtedly be constructed.

THE people of the State of California have the sum of $198,646 411.08 in the several banks of the State. The savings banks hold $127,312,088.41, the commercial banks $53,247.262.73, and the national banks $16,669,177.83.

WORK at Oneta's marble quarry, Amador county, is progressing. They are making preparations and excavating a foundation for a derrick and mill. The company propose to ship the marble in a finished state and small blocks.

THE cruiser Charleston is undergoing an overhauling at Mare Island Navy Yard and is still in the dry dock. The boilers are being retubed and the smokestack strengthened, and a large force of men is at work on the general repairs.

WORD has been received from Mint Director Leech that the Carson Mint would be run to its full capacity, and that superintendent T. R. Hofer might make any requisition necessary. It livened up Carson considerably, as a heavy deposit of bullion is now on band.

IN the township round about Mission San Jose, Niles and Alvarado, there are four great industries—fruit-growing, wine-making, a beet-sugar factory and extensive salt works. The section also sends about $100,000 worth of early vegetables each year to the city markets.

FREIGHT shipments from Stockton and the landings along the river are so heavy that the Navigation Company has put another boat on the route carrying passengers and freight. Two steamers leave Stockton for San Francisco every day and every other day three steamers are sent out.

A TUNNEL 1140 feet long on the Fort Bragg logging railroad has just been completed. It connects Redding creek with Noyo river, where the Fort Bragg Redwood Company will carry on logging operations this season. The tunnel opens up a fine body of timber miles in extent, where the ax has never been struck except for ties.

W. A. MERRALLS, a mining engineer of Los Angeles, claims to have discovered a solder for aluminum, a process which has in vain been sought for during the past 30 years. The invention will be of great value in dentistry, aluminum being admittedly far superior to rubber or gold in such work. The solder, it is claimed, is also applicable to German silver.

THE cannery at Whittier, Los Angeles county, has already canned and shipped 200,000 cans of apricots. It is now working on peaches, pears, apples and prunes, and the output is 10,000 cans daily and drying 20,000 pounds daily. This week the canning of tomatoes will be begun, and 350 tons of tomatoes have been engaged. Two hundred people are steadily engaged, and no Chinese are to be found on the premises.

AT the annual meeting of the Judson Manufacturing Company, the following named were elected directors for the ensuing term: Egbert Judson, H. E. Bothin, L. P. Drexler, G. B. Cushing, C. E. Green, N. Ohlandt and P. A. Wagner. The board met and organized by electing Egbert Judson, president; H. E. Bothin, vice-president; John Gilson, secretary; Wells, Fargo & Co.'s bank, treasurer; and P. A. Wagner, general manager.

IN September, 1891, the Board of Supervisors of Alameda county granted a franchise to F. Chappellet, H. M. Miller, N. C. Ames and Herman de Laguna to operate an electric road from Haywards to the county line of Santa Clara county. These gentlemen this week sent a communication to the Supervisors, wherein they say that they now desire to commence work on the road, and ask the board to designate the exact location upon the county roads where the tracks shall be laid.

THE big lumber raft at Fort Bragg did not start down the coast on schedule time, for its launch was unsuccessful. The pointed end slid down off the cradle and buried itself in the sand so deeply that it could not be extricated. The tides being unfavorable, no further effort will be made to tow the raft off till September 6th or 7th, when a full-moon tide occurs. It takes 15 or 16 feet of water to float the raft, and 16 feet is about the maximum depth in that part of the Fort Bragg harbor at flood tide, so that it will be a pretty near thing. The raft is 356 feet long and contains about $75,000 worth of lumber.

CONTRACTS were signed this week at Bakersfield, Kern Co., guaranteeing the construction of the East Branch Canal. This canal company has purchased water from the Kern Island Canal and Irrigation Company, and the new canal will divert water from the Kern Island Canal immediately northwest of east Bakersfield. The new waterway will run through the streets of Bakersfield and to the southeast for 25 miles. It will bring under irrigation 30,000 acres of choice fruit lands, which have previously been idle for lack of water. The new canal is under contract to be completed by January 1, 1893, and the charges will be $1.50 per acre per year.

THE Chino beet sugar factory, Los Angeles Co., has turned out this year 2,870,059 pounds of sugar. Of this quantity 516,000 pounds was from the syrups of 1891, and the balance was from this year's beet crop, 2,352,059 pounds. About one-half of the entire quantity is crude sugar, which will run between 80 or 90 per cent sugar. Upon this the Government pays 1¾ cents per pound bounty. The other one-half is raw sugar that has gone through a centrifugal machine. From present indications, this year's beet crop will amount to about 50,000 tons. For every ton the grower will receive on an average $4.50. This year 40,000 acres have been planted to sugar beets, as against 2700 last year. This year the beets run about 15 per cent sugar, as against 13 per cent last year.

AN overstocked market has placed on foot a scheme to control the lumber interests of the Pacific coast, with a view to bracing up the trade. No definite plan has been adopted yet, but propositions have been submitted to mill-owners from Alaska to southern California. The combine proposes to run the lumber business of the coast in the matter of limiting the output which has been such as to drug the market and bring about the present dull condition of trade. Puget Sound mills have swamped the yards here and elsewhere, and something must be done to revive trade. If the scheme goes through it will be the largest trust of the kind on record. The plan is to bring the mills of British Columbia, Puget Sound and Gray's Harbor into the combine and subsidize the smaller concerns on the coast.

THE new building for the mechanical and electrical engineering department at the University of California will be commenced shortly. The bids for the work were received by the Regents this week. The lowest bid for grading, brickwork, granite work, cast and wrought iron work, and sewering was that of Robert Mitchell of San Francisco, who bid $38,323. The carpenter work was awarded to Alexander L. Campbell, of San Francisco, whose bid was $14,318. For tinning and galvanized iron work the bid of Joseph Guilfoy, of San Francisco, was the lowest, being $3989. William Snook & Son, of San Francisco were awarded the plumbing contract for $1790. The painting contract was given to F. L. Holland, of Oakland, for $848. The total amount of the contracts is $59,268. The contracts will be made out for the successful bidders at once.

Mining Briefs.

IN the creek at Granite Basin, Plumas county, Charles Casey and wife are working a placer claim with excellent results. Most of their pay is in coarse gold, and they take out on an average about $6 a day apiece, Mrs. Casey working alongside of her husband, sharing in the work as well as the profits.

AT the District Fair held in Nevada City, the first premium of $50 for ores was given to the Champion Mining Co; second premium, $25, to the Mountaineer Mining Co. For the best display of minerals, the Peabody Mining Co. received an award of $50; and M. C. Taylor was awarded $25 for a display of iron ores.

IN several localities between Pinal and Gila counties, Arizona, the copper ore found is argentiferous. It is so in Mineral Creek; in Globe, the Buffalo has sufficient silver to produce bullion yielding 45 ounces per ton. In the Caliuro mountains, and within a few miles from Globe, ore is found that has noticeable quantities of gold.

THE Salt Lake *Journal* has it on good and reliable authority that the purchase of the Pioche Consolidated Mining and Smelting Company's property by the Kansas City Consolidated S. & R. Co. has been consummated, and that the property has been turned over to representatives of the Kansas City company now in Pioche. The transfer includes all of the mines, smelter, Jackrabbit railroad and other property owned by the Pioche company.

EARLY RISING NOT ALWAYS A VIRTUE.—Thousands of people have no choice whatever about their hour of rising in the morning. Later or earlier, that hour is fixed for them by the requirements of the office, the shop, or the classroom; by the timetable of the railroad; by the arbitration of their employers or the necessity of their employes. But in the cases manifold where personal liberty is enjoyed, it should not be thoughtlessly restricted simply because of the domestic tradition that early rising deserves praise and late rising blame. Breakfast may oftenbe a movable feast without materially disturbing the routine of an orderly housekeeping day. Invalids, mothers whose rest has been broken by teething babies, and, above all, rapidly growing children, should have their sleep out. Nature demands this, and violence is done to her when sleepy people are rudely aroused from their beds. Early to bedis the single safe prescription to insure early to rise. We need not repeat it over and over to our hurrying, anxious, toiling American men and women; Rest, rest, and again, rest. Do not think time ill spent that is spent in repairing the ravages of our wellnigh incessant activity.—Harper's Bazar.

The Cyanide Process.

The Chemical views of M. T., Etc.

TO THE EDITOR:—My fighting days are drawing to a close, the turmoil of battle is less grateful to me than it once was, and I should hardly have cared to cross swords with your correspondent but that he professes to have "studied carefully" his subject, and proposes to "help those interested to understand it"—a purpose which, it seems to me, his article is by no means likely to fulfill, it being, I believe, better calculated to lead to their misunderstanding.

M. T. begins by accepting as truth the claim that a weak solution of potassium cyanide has what MacArthur calls a selective affinity for gold and silver in base ores, dissolving them "by preference, leaving the base metals untouched." This, in my view, is an untenable conclusion from inadequate premises. To the unchemical reader, it may appear to be sustained by the fact that in practice the gold and silver are (more or less) dissolved, leaving associated iron pyrites, galena and some other base metal *compounds* unacted on. I might here ask why it is that the custom mill in Shasta county will not receive base ores carrying much copper or antimony, but it is not necessary to my purpose. I italicize the word compounds because it has profound significance to the question under consideration.

It is my belief that the *inventor* of this "selective affinity" never intended it for scientific use. I opine that its purpose was something very different, and analogous to that of the ounce of ammonium carbonate to a pound of potassium cyanide of the Simpson patent—(MINING AND SCIENTIFIC PRESS, July 2, 1892.) The real reason for the apparent preference, to a certain extent, of the precious metals in the usual tests is that the gold and silver are in the metallic state, or the silver is in the form of chloride or other compound which is easily soluble in the liquid, and as copper sulphuret is also soluble in it, "selective affinity" is observed to fail when that substance is present. That the failure would be more manifest in the presence of easily-soluble base compounds, such as copper or iron sulphates, etc., is certain, and is the very reason for the use of lime or other alkali in the treatment of ores containing such substances.

But a fair test of this pretense of a selective affinity can only be made by treating a mixture of precious and base metals in the metallic state. Suppose we should take gold, silver, copper, lead, iron, bismuth, antimony, arsenic and zinc, all in the metallic condition and powdered, and treat the mixture with a solution of potassium cyanide, strong or weak, within feasible working limits, what would result? As to the iron, I believe that would not be affected; the lead might also resist. How the other base metals would behave, except the last, I cannot say; but the zinc at least would receive the benefit of selective affinity, and if present in sufficient quantity to saturate the liquid, neither gold nor silver would be found in solution. It is very probable that, in the absence of zinc in such proportion, some other base metal would have a similar effect. The mildest verdict that can be given on the claim of a selective affinity for precious metal is, *not proven*.

"All substances bear certain electrical * * * * *relations* to each other." Correct; but I italicize relations, because the qualities are *only* relative, so far as known. We cannot affirm that zinc is absolutely positive, nor that carbon is absolutely negative, for zinc is negative to sodium and carbon is positive to sulphur (under ordinary conditions). We could not form even an idea of the quality of a single substance in this regard. This seems to have been lost sight of by M. T. when he wrote "Cyanide of potassium is composed of two negatives," but I am always willing to give credit for what is meant, which I take to be that cyanogen is negative to potassium; but the assertion that "the potassium causes it to seek out the most negative metals and unite with them by preference" inspires me with profound astonishment. Is M. T. aware that, in a cyanide solution, gold at least is positive to mercury, and is not precipitated by iron? What warrant is there for calling a solution of potassium cyanide "positive," and what for the statement that the positive component can cause the negative component to unite with those metals which are least positive to the latter, rather than with those which are most so? Is not the real reason of the apparent selection that the base metals in the ore are already combined with something which the cyanogen cannot displace? I ask this in good faith, for information, for I do not know what base metals (in the metallic state) can or cannot be dissolved by aqueous potassium cyanide. Even zinc, though it replaces precious metals in the solution, and though it dissolves independently of such replacement when in contact with iron, etc., forming an electro-chemical couple, may, perhaps, if pure and alone, refuse to dissolve in solution of potassium cyanide free from caustic.

The statement that "the gold and silver unite with the cyanogen without displacing the potassium" will surprise those chemists who have accepted the formula $K\,Ag\,(C\,N)_2$ for the compound of silver which exists in the solution, and who believe with Prince Bagration (*J. fr. Chem. XXXI*, 367) that metallic gold * * dissolves in aqueous cyanide of potassium * * forming aurocyanide of potassium and caustic potash.

$$Au_2 + 4\,K\,Cy + O = 2\,K\,Au\,Cy_2 + K_2\,O.$$

The fact is, the potassium will not, under the conditions supposed, give its cyanogen to the metal without a "valuable consideration" any more than M. T. would give me his gold on such terms; it must have something in exchange, and the only acceptable element available is oxygen, which it obligingly accepts. According to Elsner (*ibid XXXVII*, 333), the oxygen is derived from the air, which dissolves in the solution, or from oxycompounds formed in that by air, for he says: "The action requires access of air." I am aware that Mr. MacArthur has doubted this, but that gentleman's experiments, as related by himself, fall very far short of sustaining his view. If, however, the oxygen is derived from another source, it must be from the decomposition of water.

"It is proper to state that different solutions change the relative positions * * of some of the principal metals" in the electro-chemical series, says M. T. Correct again; and for this reason the series quoted from Gore is of no use in considering the effects of the solution in question, though it does afford an illustration of the general truth, and, as a further illustration, the following series, also on "high authority," may be instructive, albeit the first, which I presume to mean in air, does not agree with that of Gore:

+K. Na. Li. Ba. Ca. Mg. Al. Mn. Zn Fe. Ni. Co. Pb. Sn. Bi. Cu. Ag. Hg. Pt. Au. H. Si. Sb. C. B. C_2. As. P. I. B_2. Cl. Fl. N. S. O.—*Fechter*.

+K. Na. Mg. Zn. Fe. Al. Pb. Sn. Bi. Cu. Ag. Hg. Pt. Au. H. Sb. C. Te. P. Se. I. Br. Cl. N. S. Fl. O —*Gore v. T. M.*

It will be seen that there are discrepancies, but the conditions may have differed; we have also:

In water, + Zn. Pb. Sn. Fe. Sb. Bi. Cu. Ag. Au.—*Fechner*.

In dilute sulphuric acid, one volume each water and acid:
+Zn. Cd. Po. Sn. Fe. Al. Ni. Sb. Bi. Cu. Ag. Au. Pt.—*Poggendorf*.

In one volume strong nitric acid and seven volumes water:
+Zn. Cd. Pb. Sn. Fe. Ni. Bi. Sb. Cu. Hg. Ag. Au. Pt.—*Faraday*.

In one volume hydrochloric acid to one volume water:
+Zn. Cd. Sn. Pb. Fe. Cu. Bi. Ni. Ag. Au. Pt. Graphite. Soeroxide of manganese.—*Faraday*.

In solution of sal ammoniac:
+Zo. Cd. Pb. Sn. Fe. Bi. Sb. Ag. Hg. Au. Pt. Graphite.—*Pogg*.

In solution of yellow sulphate of potassa. (Probably a misprint for yellow sulphide or yellow prussiate of potassa):
+Zn. Cu. Cd. Sn. Ag. Sb. Pb. Bi. Ni. Fe.—*Faraday*.

In solution potassium cyanide:
+Au. Hg.—*Wm. Skey*.

These determinations are not very recent, and it must be considered that a slight impurity in a substance might cause error; also, not only different liquids but different temperatures give different results.

If, as M. T. says, "Cyanogen associated with potassium is of a positive character and prefers negatives," how is it that it prefers zinc to gold and silver? Zinc is constantly positive to the precious metals in all of the above series, unless we are to except the last, which must then be written, + Hg. Au. Zn.—with Cu. somewhere on the positive side of zinc, and we shall have the interesting spectacle of the cyanogen "preferring" the metal which is least opposed to it electro-chemically, instead of the reverse as usual.

While on this prolific subject of discussion, the cyanide process, I take the opportunity of remarking that, according to the *E. & M. Jl.*, it has failed at the Needles. It has also failed in giving satisfaction at the Gold Blossom mine in Placer county, and I hear of another case in which they say they extract the gold from the ore, but do not find it in their pockets—do not find it anywhere, in fact. I do not know whether these failures are due to defects in the process or to the incompetence of the operators, but I insist that the gold extracted from the ore is somewhere, and it is the duty of the chemist in charge to find out where. By the way, though, perhaps they have no *chemist*, but only a "practical man!"

Those who have precipitated gold from a cyanide solution on zinc, in a test tube, may have observed that a white powder was produced. I have seen it, and the chemist at the Calumet works, since deceased, mentioned it in a letter. I did not pay much attention to it at the time. Lately, I have seen a lump of dried precipitated gold, mixed with zinc shavings, which contained a considerable proportion of a white substance. In melting the gold in a black-lead pot, volatilizing the zinc, a very large loss of gold has been observed, as I am informed. Finally, it is stated in Watts' Dictionary of Chemistry, Vol. II, that a solution of aurocyanide of potassium gives a white precipitate on the addition of a zinc salt. Possibly these facts may afford a clew to the whereabouts of the missing gold. On the whole, I think the present method of attempting the recovery of the gold is "a lame and impotent conclusion" of the cyanide process, and if M. T., or any other man, will find a better, he will remove a serious obstacle to its success.

In the meantime, I suggest that the solution may be used until it shall be saturated, or nearly so, with gold, and then allowed to *stand* in contact with zinc until all of the gold is precipitated in one form or other, then decanted through a filter and either reinforced and used again or thrown away, as may be found best. Or, the gold may be precipitated by electrolysis; it may be necessary to provide for the neutralization of hydrocyanic acid, which can probably be done by adding caustic potash. In this way the solution would be regenerated, which might pay for the electricity.

I should like to know if there is, anywhere in the United States, a place where the process is being successfully operated by parties who are entirely disinterested as to its adoption by others, and if there is any place in, or not too far from California, where the process is in regular, continuous and successful operation, not only *extracting* a satisfactory percentage of the gold from the rock, but also converting it into money. I am willing, even though the owners may be interested in selling rights or licenses, to go and investigate to the best of my ability, and report results in the interest of metallurgy, of the MINING AND SCIENTIFIC PRESS, and of my own great glorification and enlightenment. The proprietors of this paper promise me their assistance in doing this if the opportunity should offer and if full facilities be granted.

To prevent misunderstanding, I remark that this offer does not apply to operations which are not satisfactorily successful; those who need a *doctor* must pay for one.

C. H. AARON.

Refining Copper.

Mr. G. W. Stead of Germantown, Philadelphia, was in the city yesterday and gave the *Montana Mining Journal* an account of the manner of refining copper by electricity. The only plants using the process, which Mr. Stead first adopted in this country, is one at Pawtucket, Rhode Island, and the one now being constructed at Great Falls by the Boston and Montana Company. The process is similar to that of electroplating, which has long been employed in treating plates for printers' uses, but the solutions are different. The copper is put into cells with proper solutions, which forms the anode of a circuit, and the refined copper is deposited on a sheet of copper in another cell, which is the cathode of the circuit.

First the matte has to be refined in converter, so that all the iron, antimony, and every trace of arsenic is removed from it, when it is cast into bars of the proper shape and size for the cells into which it is placed. When the circuit is established, a steady current is maintained by means of a dynamo, and every three days the bar is lifted and the slimes which have accumulated upon it are removed and it is again placed in the cell. This is repeated until the copper is all dissolved, which takes about 35 days. The deposited copper is as pure as it is possible to make it, being within a very small fraction of 1000 fine. The estimated cost of treating a ton of copper by this process is $5 in Rhode Island. At Great Falls the cost will be less, for there the melted matte will be received into converters, and the cost of remelting the matte will be saved. This cost can be further lessened by increasing the facilities for handling the product in various stages. Four men during the day and one at night are sufficient to take care of a 10-ton plant, outside of the engineers and firemen, if steam is used to generate electricity.

The object of refining copper by this process is to make the copper absolutely pure, and save at the same time the gold and silver in the matte. The increased value of the refined copper will pay for the cost of refining, and the gold and silver extracted will be almost or quite clear profit. The refiners in purchasing matte only allow the producer of the matte the silver over 30 ounces. This is about 50 ounces of silver to a ton of refined copper. If a company operating such a plant as this would pay the same price for the matte, the whole of the silver and gold would be saved and would constitute the profit of the owners of the plant. If the amount refined was ten tons, the profit would be $500 a day. The plant would cost, ready to run, about $125 000. The money for the stock could be turned over every 35 days, and the gold and silver would be gathered every day, if it was desirable. As the slimes are gathered, they can be reduced as fast as they accumulate.

The fact that the Boston and Montana Company have invested a large amount of money in such a plant, after having tried it thoroughly in the Pawtucket refinery, is proof that the process is no experiment. It was first tried in Germany, and has been in operation in this country about ten years. There is no reason why such a refinery, or several of them, should not be set up in Butte. In fact, it would no doubt be profitable for each smelter in Butte to have a plant sufficient to refine the copper produced therein, for the cost of remelting the matte would be saved. On the amount of copper produced in the State last year the saving would be nearly three million dollars.

It seems to us that this method of refining copper has such merit that our capitalists and smelting men should look into it. Copper can be refined in Montana as cheaply as elsewhere. In fact, it can be refined more cheaply, if such a plant was operated in conjunction with our smelters, for the cost of smelting the matte would be saved. Such a plant should be erected at once, for the saving would be greater than the present profits of the smelters.

Heat at the Center of the Earth.

The workmen in the deepest mines of Europe, says a writer in *Goldwaithe's Magazine*, swelter in almost intolerable heat, and yet they never penetrate over .007 part of the distance from the surface to the center of the earth. In the lower levels of some of the Comstock mines the men fought scalding water, and could labor only three or four hours at a time until the Sutro tunnel pierced the mines and drew off some of the terrible heat, which had stood at 120 degrees.

The deepest boring ever made, that at Sperenberg, near Berlin, penetrates only 4172 feet about 1000 feet deeper than the famous artesian well at St. Louis. While borings and mines reveal to us only a few secrets relating solely to the temperature and constitution of the earth for a few thousand feet below the surface, we are able by means of volcanoes to form some notion of what is going on at a greater depth. There have been many theories about the causes of volcanoes, but it is now generally held that, though they are produced by the intense heat of the interior of the earth, they are not directly connected with the molten mass that lies many miles below the immediate sources of volcanic energy. Everybody knows that many rocks are formed on the floor of the ocean, and it has been found that a twentieth to a seventeenth of their weight is made up of imprisoned water.

Now, these rocks are hurled in time under overlying strata, which serve as a blanket to keep the enormous heat of the interior. This heat turns the water into superheated steam, which melts the hardest rock, and when the steam finds a fissure in the rock above it, it breaks through to the surface with terrific energy, and we have a volcano. We find that these outpourings, which have lain for countless ages many thousands of feet below the surface are well adapted to serve the purposes of man. Many a vineyard flourishes on the volcanic ashes from Vesuvius, and volcanic mud has clothed the hills of New Zealand with fine forests and its plains with luxuriant verdure. The most wonderful display of the results of volcanic energy is seen in the northwestern corners of our own land, a region of lofty forests and of great fertility.

Mechanical Progress.

Tungsten Steel.

Many users of tool-steel are not aware that Mushet's special steel owes its property of becoming and remaining hard when cold, without the necessity for any hardening process, to the fact that it is an alloy of tungsten and ordinary carbon-steel. Its extreme strength and hardness are due, principally, to the large percentage of tungsten, which it is possible to incorporate as a perfect alloy. One of the chief advaotages of its use for tools is that, should they be heated by friction as is so often the case, either in grinding or cutting, it does not impair their hardness in the least, whereas a tool of ordinary carbon-steel would, under the same conditions, require to go to the tooldresser for rehardening. In all other respects there are many brands of the tool-steel which are fully equal to the Mushet. It is not for tool purposes alone, however, that this property of tungsten is valuable. Its cost is low enough to admit of its use with the lower grades of steel, and the degree of hardness can be graduated to suit any desired purpose, from the very hardest to the lowest temper. The requisite percentage of tungsten necessary to give the required temper can be calculated as accurately as can the carbon for ordinary steel. As an example of the lowest temper, that of a hot-coiled spiral car-spring may be cited. By careful comparative tests with a carbon-steel spring made of precisely the same mixture as the other, but without the tungsten, its carrying capacity was about 20 per cent greater, while its resilience or resistance to permanent set was about the same. After testing, it was placed in the tempering furnace used for the ordinary springs, and after heating to full red heat, was left in the furnace and allowed to cool with the latter. A more perfect annealing process could hardly be devised, as it required about 36 hours to cool it sufficiently to handle. It was then retested, and, strange to say, showed an increased carrying capacity of about five per cent, and no further permanent set. Samples of the same steel, but with varying perceotages of tungsten, were tried for different purposes, and were, in all cases, satisfactory. A chipping chisel was forged from it and heated to full-red after dressing and grinding. After cooling naturally, it was tested on cast and wrought-iron, steel and brass, and stood the roughest possible usage without injury. While these various tests were eminently successful they were barren of practical results, as the company io whose interest they were made discontinued business shortly after. As the difficulties of its manufacture are no greater than are experienced in ordinary steelmaking, and the cost of tungsten oxide being within the commercial limit, it seems rather remarkable that the use of this alloy should be confined to the one purpose met by the Mushet brand. The percentages required for given degrees of temper, also those of manganese and carbon giving the best results, would, of course, have to be determined by careful and systematic experimeots. There can be no question as to the advantages of a steel having its temper independent of any and all conditions to which it could be subjected. In connection with the tests alluded to a series of tensile tests on a Fairbanks testing-machine were made. The average breaking-strain was about 112,000 pounds, while the elongation was somewhat less than that of carbon-steel. —Iron.

LIMITS OF STEAM EXPANSION.—The following extract from a circular issued by a firm of well-known builders of a high-speed engine said to run satisfactorily at 700 revolutions per mioute, and to develop 200 horse power, is interesting, since it attempts to confioe the use of double and triple expansion to certain limits: If the boiler pressure always exceeds 70 pounds, it is worth while to use a compound engine; if as high as 150 pounds, a triple expansion engine. If the engine exhausts into a vacuum, the corresponding pressure will be about one-fourth lower. The exient to which the steam may be expanded with advantage depends upon the boiler pressure. If the expansion is carried to more than a certain number of volumes, it is advantageous to divide it into two stages, *i. e.*, to expand partly in a high pressure or small cylinder or cylinders and partly in a low-pressure or large cylioder or cylinders. With still greater expansioo, it is worth while to expand in three stages, *i. e.*, in three successive cylinders of increasing diameter, and so on. But, although there are great practical and economic advantages in the system of expaosion in successive stages, there is no essential difference in principle between expanding, say eight times, in a series of three cylinders, with comparatively late cut-off in the first or smallest one, and expanding eight times in the largest of the three only, with the steam admitted to it direct and cut off at one-eighth stroke.

Lathe Testing.

The method of lathe testing, which consists in bringing the centers of the lathe together and sighting them, is of no value for even ordinary machine work. If the centers could be adjusted exactly in line by this method, when they are separated they may he found incorrect for any other distance.

It is practically impossible to turn a true cylinder between the centers of any lathe, however perfect; true cylinders can be produced by grinding only, the work being supported upon the centers.

The first operation in testing a lathe is to put the centers in line at a distance of from two to ten feet according to the size of the lathe. Place in the lathe a piece of shafting, stiff enough to support itself without springing; square up its end, and center it, taking care to have the centers drilled deep enough to prevent the lathe centers from bottoming. Insert a pin in the end of the shaft, so that it can be driven without the use of a lathe dog. With a sharp tool turn the head end of the shaft for a short distance. Then, without moving the tool, take the work out of the lathe run the tool carriage down to the tailstock, replace the work, and turn the opposite end of the shaft for a short distance. If the calipers show no variation in the size of the work at opposite ends of the shaft, the lathe is in line; if there is a difference, the tailstock must be set over until the tool, without further adjustmeot, turns the same diameter as it did at the opposite eod of the lathe. In making this test the tool should be set exactly level with the centers.

With the lathe adjusted to this extent, remove the turning tool and insert aoother having a very fine point. Run the carriage back, remove the live center, replace it with a stick three feet long fitted to the spiodle and firmly driven in the place of the center, run the carriage up and allow the fine-pointed tool to scratch the eod of the stick as it revolves; if it makes a point, the lathe is true. If the tool describes a small circle, the lathe is out of true, and the headstock must be readjusted by scraping the surfaces which bear upon the bed, to make the necessary correction. Remove the tool and run out the tail spindle; if the dead center goes into the point made by the tool, the lathe is true. If the center does not enter the point, the tailstock must be corrected by scraping, as io the case of the headstock. This method of testing is open to the objection that the stick may spring of its own weight. Lathe builders have special apparatus.—Optician.

Electricity in Railroad Shops.

A paper bearing the above title was read by C. A. Seeley recently before the Northwest Railroad Club. Among other things Mr. Seeley said: "One difficulty to be overcome in the use of small motors is their speed as compared with all machines used in iron working. One convenient way of overcoming this would be to mount the motor on a plate, on which standards would carry a shaft and pulley so arranged that the pulley would he in fraclional contact with the pulley on the armature. This counter pulley could be ten or more times the diameter of the oiher and have a grooved cone on one side, from which a round belt could be run to a grooved pulley on the machine to be driven. By a system of idlers, tension and direction could be given to the belt. The motor having a constant speed, the cone would permit chaoges of speed at the tool. Many forms of special tools could be devised in this connection.

"In the Crewe shops in England portable drills capable of drilling one inch holes io steel are in use which are electrically driven. The drill spindle is the arbor of a worm wheel, and a dynamo armature is on the shaft of the screw whicb works the wheel, and the whole apparatus—dynamo and all—weigh sixty-five pounds. Another application used in the same shop is a saw for cutting tubes out of locomotives. The saw arbor is also the arbor of the dynamo armature; and the saw is just large enough to enter the tube; the frame work carrying this is held up against the tube sheet by hand, an eccentric motion forces the saw through the tube on one side, and then by another motion the saw is carried around, completely severing the tuhe. The saw is then returned to the center and withdrawn, and the tube cao then drop down. The beauty of this operatioo lies in its celerity of cutting, and in the fact that the tube end is neatly cut off square and ready at once for scarfing for a new safe end.

G. & E. PENNINGTON & SONS,

STEEL WORKS.

MANUFACTURERS OF

Best Refined Cast Tool Steel, Machinery and Hammer Steel,

Steel Piston Rods, Shear Blades, Lathe Spindles, and all kinds of Steel Forgings Made to Order.

REFINED BAR STEEL IN OCTAGON, ROUND SQUARE OR FLAT, MADE IN SIZES AND LENGTHS TO ORDER.

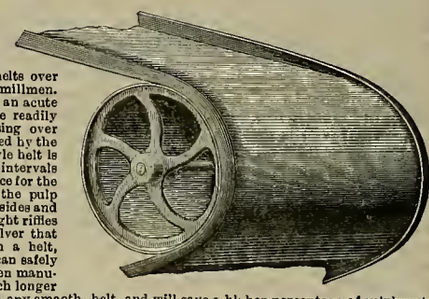
Miners' Drill Steel, Picks, Crowbars, Sledges, Hammers, Etc.

Chaine all Sizes and Lengths Manufactured to Order. N. B.—Drill Steel, any Length from one to thirty feet.

OFFICE AND WORKS:

218 and 220 FOLSOM STREET, - - SAN FRANCISCO, CAL.

THE BLASDEL CONCENTRATING BELT COMPANY.



We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will he readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

SEND FOR PRICE LIST.

The Judson Dynamite and Powder Co.,

MANUFACTURERS OF

Dynamite and Blasting Powder,

18 CALIFORNIA STREET, SAN FRANCISCO.

Directors:

EGBERT JUDSON, ALVINZA HAYWARD, THOMAS BELL, JOHN S. DOE, ED. G. LUKENS (President.

NEW AND VALUABLE BOOKS
— FOR —
METAL WORKERS.

LANGBEIN.—A Complete Treatise on the Electro-Deposition of Metals. Comprising Electro-Plating and Galvanoplastic Operations, the Deposition of Metals by the Contact and Immersion Processes, the Coloring of Metals, the Methods of Grinding and Polishing, as well as Descriptions of the Electric Elements, Dynamo-Electric Machines, Thermopiles, and of the Materials and Processes used in every Department of the Art. Translated from the German of Dr. George Langbein, with additions by William T. Brannt, Editor of "The Techno-Chemical Receipt Book." Illustrated by 125 engravings. In one volume, 8vo, 404 pages. Price $4.00

BLINN.—A Practical Workshop Companion for Tin, Sheet-Iron and Copper-Plate Workers. Containing rules for describing various kinds of Patterns used by Tin, Sheet-Iron and Copper-Plate Workers. Practical Geometry; Mensuration of Surfaces and Solids; Tables of the Weights and Strengths of Metals and other Materials; Tables of Areas and Circumferences of Circles; Composition of Metallic Alloys and Solders, with numerous valuable Receipts and Manipulations for everyday use in the workshop. By Leroy J. Blinn. A new, revised, and enlarged edition, printed from new type, and with 170 newly engraved illustrations. In one volume, 12mo, 296 pages. Price.....$2.50

BRANNT.—The Metal Worker's Handy Book of Receipts and Processes—Being a Collection of Chemical Formulas and Practical Manipulations for the Working of all the Metals and Alloys, including the Decoration and Beautifying of articles manufactured therefrom, as well as their preservation. Edited from various sources by William T. Brannt, editor of "The Techno-Chemical Receipt Book." Illustrated by 63 engravings. Over 500 pages, 12mo, cloth, gilt, closely printed, containing a vast amount of valuable matter on all the Metals and Alloys, not to be found in any other book in the English language. Price.....$3.50

BRANNT.—The Metallic Alloys. A Practical Guide for the Manufacture of all kinds of Alloys, Amalgams, and Solders used by Metal Workers, together with their Chemical and Physical Properties, and their application to the Arts and Industries; with an Appendix on the Coloring of Alloys. Translated and edited, chiefly from the German of A. Krupp and Andreas Wildberger, with extensive additions, by William T. Brannt, one of the editors of "Techno Chemical Receipt Book," etc. Illustrated by 16 engravings. 12mo, 428 pages. Price.....$3.00

RICHARDS.—Aluminium. — Its History, Occurrence, Properties, Metallurgy and Applications, including its Alloys. By Joseph W. Richards, M. A., A. C., Instructor in Metallurgy at the Lehigh University. Second Edition revised and greatly enlarged. Illustrated by 23 engravings and two diagrams. Price.....$5.00

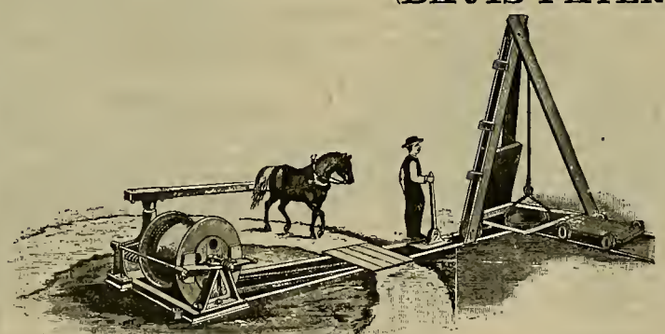
JOSHUA HENDY MACHINE WORKS,
NO. 51 FREMONT STREET, SAN FRANCISCO, CAL.
BUILDERS OF
"Sensible" Horse-Power Hoisting Whims.
(DAVIS PATENT.)



PRICES REDUCED.

The "Sensible" Hoist is the cheapest and beyond doubt the best in the market. It is built entirely of iron and steel, mounted on a heavy iron base plate, and is therefore very durable and not affected by exposure to climatic influences.

The bevel gear on the drum shaft is loose, and, in hoisting, drives the drum through a friction clutch. This avoids the frequent accidents occurring with other Whims, occasioned by the breaking of the gear teeth when throwing them out of gear. In lowering, the drum is pressed by a powerful screw lever against brake woods at the opposite end. Perfect means of adjustment are provided for the friction clutch and brake blocks.

As the drum is entirely independent from the driving gears the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases the capacity of the machine by avoiding the loss of time due to stopping and starting the horse.

It is very light and compact and very easily taken to places for transportation by mules. The cost of erection is very small, two men in half a day being able to put it in place ready for work.

Weight of hoist, 1200 lbs. Total shipping weight, including sweep, levers and sheaves, 1400 lbs.

Circulars giving Capacities and Prices furnished on application.

BALDWIN LOCOMOTIVE WORKS.
ANNUAL CAPACITY 1000. ESTABLISHED 1831.
LOCOMOTIVE ENGINES!

Adapted to every variety of service, and built accurately to standard gauge and templates. Like parts of different engines of same class perfectly interchangeable.

Scientific Progress.

Water-Ram in Steam Pipes.

If steam be introduced below the surface of water contained in a large vessel, a bubble will be formed which will increase in size until its surface becomes sufficiently extended to condense the steam more rapidly than it can enter, when a partial vacuum will be created, the bubble will collapse, and the water, flowing in from all sides at a high velocity, will meet with a blow forming what is called a water-ram.

Such explosions occurring in the middle of the mass creates simply a series of sharp noises. But if steam be blown into a large inclined pipe full of water, it will rise by difference of gravity to the top of the pipe in the form of a bubble; and when condensation takes place, the water below the bubble will rush up to fill the vacuum, giving a blow directly against the side of the pipe. As the water recedes the bubble gets larger, and moves farther and farther up the pipe, the blow each time increasing in intensity, because the steam has passed a larger mass of water, which is forced forward by the incoming steam to fill the vacuum.

The maximum effect generally occurs at a closed end. Even if the water does not originally extend to the end of the pipe, if this be filled with steam which has bubbled through water on its way to that point, there may be sufficient cold metal to condense it; and when collapses take place the whole mass of water in the pipe is driven against the end, sometimes with sufficient force to rupture it.

A dangerous water-ram may be produced in a pipe filled with water, even if the end be open, should the pipe be crowned upward at any part of its length. A bubble will form at the top of the crown, and there collapsing, water will be forced in by atmospheric pressure from one end and by steam pressure from the other, and the meeting of the two columns may rupture the pipe. The same action can occur in a level pipe, but not in one which descends away from the entering steam, so that the latter is always above the water.

SPONTANEOUS COMBUSTION. — Spontaneous combustion is no doubt due, primarily, to the absorption by coal of the oxygen of the air. All kinds of coal, after being cut or broken, begin to absorb oxygen, the amount varying in volume according to the quality of the coal. The absorption of the oxygen raises the temperature of the coal, and this augments the rate at which the oxygen is taken in. Although the absorption of oxygen does not raise the temperature of the coal sufficiently high to cause combustion, the oxygen itself becomes chemically active, and in bituminous coal it combines with the contained hydrogen and carbon, thus further increasing the temperature. When such action takes place in the center of a heap of coal, a sufficient quantity of air may be supplied to cause spontaneous combustion. It is also claimed that pyrites in the coal play an important part in promoting combustion. The chemical change which the pyrites undergo, especially if there is a large percentage of that substance present, in some instances liberates sulphur, and as the temperature necessary to ignite sulphur is only 482° Fahrenheit, while in the case of cannel coal, which ignites at the lowest temperature among the several kinds, 698° Fahrenheit are required, it will be seen that, in consequence of the chemical change indicated, the actual temperature of ignition is really lowered 200 degrees in cannel coal. Pyrites also promote spontaneous combustion through the tendency of the coal to split up in small pieces, caused by expansion from oxidation, thus exposing fresh surfaces with a consequent increased absorption of oxygen. Coal cargo fires are more frequent in the tropics than in the higher latitudes, but the introduction of high steam pressures, with the consequent increase of bunker temperature, in connection with triple expansion engines, has had the same effect upon the bunker coals of steamships that the natural heat of the tropics has had upon coal cargoes. It has been said that the so-called ventilation which has from time to time been introduced in ships is one of the most prolific causes of spontaneous combustion.

THE ELECTRICAL PRODUCTION OF OZONE.—One use of ozone, on which Herr Frolicb lays special stress in a recent lecture, is the disinfection and sterilization of water. From recent experiments in the Siemens and Halske laboratory at Berlin, it appears that good results bave been attained in producing ozone on a commercial scale by means of the silent electric discharge. An apparatus now at work in the laboratory yields 2.4 mg. of ozone per second. Experiments are being made in supplying compressed ozone for technical use, and this has been accomplished with a pressure of nine atmospheres.

When Water Freezes.

Let us take our stand, says a contemporary, on the banks of a lake—preferably on a clear winter evening—and at once commence operations by ascertaining, by means of two thermometers, the temperature of the water at the surface and at the bottom, and we find, let us say, that these are 48° and 45° respectively. A cold wind sweeps over the surface of the lake, so that the temperature of the water there is speedily reduced, let us say, to 44°. By this reduction in temperature, it contracts and becomes specifically heavier, when of course it sinks and displaces the comparatively light and warm water below, which rises to the surface, gets cooled below 44°, and immediately falls, displacing the warmer water at the bottom, which in turn rises, gets cooled and falls, its place being again supplied by lighter and warmer water. And so the cooling and sinking process goes on, the upper thermometer always indicating the highest temperature, when suddenly the magic point, 39°, is reached, when all movement at once ceases. The upper layer of water is still exposed to the cooling influence of the wind, and speedily falls in temperature, but it still retains its place. Our upper thermometer shows plainly that the water which surrounds it is being rapidly reduced in temperature, but the lower one remains stationary at 39°. At tbat temperature we know that water is heavier than at any other, and there like a stone it remains at the bottom, and as it is fully protected from outward influences by the mass of superincumbent water, its temperature remains very much at the same point. The water on the top, however, having nothing to protect it, gets colder and lighter every moment. Down the thermometer goes to 37°, 35°, 32°, and then a slight breeze ripples the surface, and the next moment a thin sheet of ice spreads itself over all. The ice, however, is colder and lighter than the water, so tbat it floats on the surface and acts as a blanket, protecting the comparatively warm and heavy water below from being cooled. During even the severest winter, therefore, only a thin superficial layer of ice is formed, which serves all the useful and ornamental purposes required of it, and when its duty is finished, it readily melts and disappears under the genial influence of the first few warm days of spring.

How a Fish Sees.

The medium in which fresh-water fishes live gives them a chance to see a great distance only in the borizontal direction, and the proper adjustment of the eye would make, under usual conditions, the optical axis take this direction. To me it seems impossible to explain the constant revolution the eyeball on any other hypothesis except that given, viz.: That the optical axis extends forward instead of sidewise.

When a fish wishes to eat anything, either at the bottom of the pond or at the surface of the water, it swims directly toward the object; and in this case the eyes are instantly adjusted in line with the body, so as to bring the image of the particle desired upon the posterior portion of the retina. In this case they lose their usual horizontal position.

If a fish wishes to turn to the right or left in the water, the first movement is that of the eyes in unison with the direction of the turning. This would be entirely unnecessary if the apparent axis was the axis of most distinct vision, as one of the eyes would see all that was to be seen in the side of the turning. After this movement of the eyes, the body turns enough to bring the eyes into their normal position; then there is again a movement of the eyes, and next a movement of the body. This causes a peculiar jerking motion of the eyeballs during the whole time of tbe turning of the body.—American Angler.

A CLEVER utilization of photography, for the purpose of correctly sighting a cannon, is due to the ingenuity of Marquis de Fraysseix-Bonin, a naval captain. He calls it the *tir optique*. The object to be aimed at being reflected on a plate, the marksman has only to bring the sight of his cannon on to the object reflected on the plate. This is done by a small, delicately arranged mechanical apparatus. The moment the pointer of this instrument touches the object on the plate the cannon is fired.

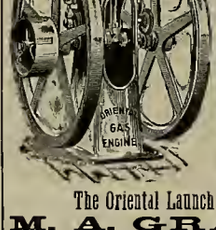
Nevada Metallurgical Works.
NO. 28 STEVENSON STREET,
Near First and Market Streets, S. F.
O. A. LUCKHARDT, Manager. ESTABLISHED 1869
Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, etc.
Working Tests (practical) Made.
Plans and Specifications furnished for the most suitable Process for Working Ores.
Special attention paid to Examinations of Mines; Plans and Reports furnished.
C. A. LUCKHARDT & CO.,
(Formerly Huhn & Luckhardt,)
Mining Engineers and Metallurgists.

THE ORIENTAL GAS ENGINE


IS THE BEST, because it combines simplicity of construction with power and economy in space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.
It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.
Send for circulars and prices if a good safe engine is what you need.
The Oriental Launch is Perfection.

Electricity.

Development of Electric Lamps.

Considerable interest is beiog felt as to the next most probable development of electric-light engineering. Except in detail, no great advance seems possible in dynamos, since at present many of them work at 95 per cent efficiency under full load. There is room certainly for improvements in transformers and accumulators, but these are hardly likely to be of such a character as to materially affect the economy of distribution as at present practiced. We therefore turn to the lamp, the other factor in the system, and ask whether improvements in lamps, of such importance as to render electric light generating-plant to be able to be worked at much higher rates of efficiency, are possible or probable. Here we find there is the possibility, but under present conditions hardly the probability. While the manufacture of these necessaries is in the hands of a great monopolist company, it is hardly likely that it will be very anxious to introduce changes which may interfere with the ordinary processes of manufacture.

The possibility is the commercial manufacture of higher voltage iocandescent lamps, says *Electricity* of London. It seems to be hardly fully realized by electrical engineers that if we can only double the electromotive force at the terminals of our lamps, we either are able to supply the same amount of electrical energy to the same district for a quarter of the expense of copper cooductors, or else for the same cost to supply four times the area. It therefore seems in every way desirable that we should endeavor to maoufacture higher voltage incandescent lamps. The usual E. M. F. employed at the present time is 100 or 110 volts. There are a few isolated installations where lamps of 150 and 160 volts are in use, but they are, comparatively speaking, few.

There are difficulties, we koow, in the manufacturing of say 200 or 220 volt lamps; the filament must be both very long and very thin—long enough to give us the requisite electrical resistance; thin so that the small amount of current required may render it incandescent.

We believe, however, that the real practical difficulty arises not so much in the manufacture of the filament itself as in the successful exhausting of the bulb. With such fine filaments, these will soon burn out, unless special care is taken in exhausting. In an imperfect vacuum there is also a constant electrical discharge from one side of the looped filament to the other with the high electromotive force employed to light the lamp. This may often be seen by shielding the glare from the filament, and carefully noting the blue discharge from platinum to platinum. This discharge continued over a lengthened period is very detrimental to the long life of the lamp, and to effectually prevent this requires more care in the processes of exhaustion than is possible without special attention being given to each lamp.

It is announced by the American press tbat Mr. Edison is at preseot at work on a 200-volt lamp. While giving Mr. Edison due credit for his great services to electrical engineering science, we would point out that the problem has been seriously attacked, and in some cases successfully surmounted, both in this country and in France. A recent number of *L'Industrie Electrique* contains diagrams of some French Edison-Swan 200-volt lamps, in which the extra loog filaments are supported by platinum loops welded into the sides of the lamp. We do not think, however, that this is the final solution of the problem. The joints in the glass bulb should be kept as few as possible in an ideal lamp, as each joint increases the chances of the glass cracking, and so causing leakage, due to the unequal expansion of tbe glass, and it is difficult to ensure such perfect welds of platinum to glass, that we are certain no air leakage takes place through it. Lamps of 180 volts were certainly succesfully made in this country three years ago, and there seems every reason to suppose tbat as soon as competition again exerts its beneficial influence on lamp manufacture, 200-volt lamps will be as perfectly made aod become as thoroughly reliable as our present 100-volt ones. This, we feel sure, is the direction in which the next great development toward the popularization of the electric light will be made.

THE POLYPHASE CURRENT IN FRANCE. According to the *Revue Internationale de l'Electricite*, MM. Guitton and Bertolus, owners of the Oerlikon patents for France, have concluded a 30 years' electric light and power contract with the municipality of Romans. They propose to use a 1000-foot fall, 17 miles distant from the town, and to employ polyphase currents. The Edison Company of Saint-Etienne also intends to adopt the polyphase system in carrying out the large transmission and distribution of power scheme voted by the municipality. Near Montpellier, a 200 h. p. fall is to drive polyphase dynamos supplying current to a group of villages.

AN ELECTRIC WAGON.—Trial was made in Chicago recently of a park wagon equipped with a small 3 h. p. motor and a 24-cell storage battery. With five persons in the wagon, it left the barn of the American Battery Company, on Monroe street, and traveled by the way of Winchester avenue to Jackson Boulevard, to La Salle street, to the compaoy's office at Monroe and La Salle Sts. The run was made in 22 minutes. After a few minutes, another party made the return trip. It is calculated that the wagon can make ten miles an hour easily with the present motor, and can climb any hill in Chicago.—Electrical Engineer.

Useful Information.

THE BOTTOM OF THE OCEAN.—There is a common but erroneous notion to the effect that a human body, or even a ship, will not sink to the bottom of the profounder abysses of the oceans, but will, on account of the density of the waters at a great depth, remain suspended at some distance above the surface of the earth. This is an error. No other fate awaits the drowned sailor or his ship than that which comes to the marine creatures who die on the bottom of the sea; in time their dust all passes into the great storehouse of the earth, even as those who receive burial on land. However deep the sea, it is but a few hours before the body of a man who finds his grave in the ocean is at rest upon the bottom; it there receives the same swift service from the agents which, in the order of nature, are appointed to care for the dead, as comes to those are reverently inhumed in blessed ground. All save the hardest parts of the skeleton are quickly taken again into the realm of the living, and even those more resisting portions of the body in time are, in large part, appropriated by the creatures of the sea floor, so that before the dust returns in the accumulating water to the firm, set earth, it may pass through an extended cycle of living forms. —Scribner's Monthly.

PERPETUAL MOTION.—A writer in the *Engineering Magazine* says: The true inventor has no regard for dogma; he believes he sees light ahead and moves toward it. It may be that what he sees is an *ignis fatuus* or a chimera, but he insists on discovering that for himself, and he is satisfied with no theories. I recently talked with a perpetual motion man and tried to dissuade him, being confident it would be easy to convince so intelligent a person that his scheme was not possible. But he arose above my dogmas in an instant by showiog that the whole solar system is a perpetual-motion device, moving without assignable cause and not varying an instant of comparative time within the period of its recorded history. I thought of Galileo and stopped.

BICYCLES OF ALUMINUM.—Several inventors of reputation are now engaged in the manufacture of bicycles principally made of aluminum with an alloy of titanium, whereby the strength of aluminum is increased over 75 per cent without increasing the weight of aluminum or its specific gravity. The alloyed aluminum is said to stand a tensile test of 73,500 pounds per square inch compared to pure aluminum to 22,300 pounds, cast iron 17,000 pounds, cast brass 23,000, good wrought iron 48,000, cast steel 61,000, Schmeidharenguss 200,766 pounds tensile strength per square inch.

A SCOTCH boat-builder is constructing a yacht entirely of alumioum alloy. The metal is as white as silver and posesses a breaking strain of 24 tons to the square inch. It is unaffected by water. The yacht, which instead of being painted will be polished, will be about 32 feet long and eight feet broad, and will be provided with a roomy cabin paneled in oak and a commodious forecastle; and the deck fittings, as well as a center-board dingey which will accompany the yacht, will be made of the same white metal. If this experiment should turn out successful, a new departure in yacht construction and fittings may be expected.

OVERCOMING GRAVITY. — A boy who could not stand still for a single moment on a sheet of thin ice without breaking through it, could skate over it in perfect safety, simply because he put himself in antagonism to gravitation by pursuing a line of motion at a right angle with its downward vertical pull, and consequently lessening his weight as tested by a spring balance. In fact, the increase of velocity of any body not approaching the center of gravity, whatever its momentum, tends to lessen its weight, and were the whole periphery of the earth a series of the most delicate and sensitive spring balances, a body rolliog over them throughout the whnle of the vast circuit would register its weight more or less according to its velocity.—N. Y. Herald.

IN calmiog the ocean by means of oil, it has been found that petroleum and mineral oils in general are inadequate for the purpose, and that train oil is the most effective.

A. T. DEWEY. W. B. EWER. G. H. STRONG.
DEWEY & CO.'S
Scientific Press Patent Agency.
ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us ofter to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

FULDA'S PATENT BAND AND HOOP COUPLING.

The Best, Simplest and Cheapest Coupling for Tank Hoops.
A sufficient lap of hoop renders it unnecessary to rivet the hoop. It will fit the circle of any tank, regardless of size. Made in sizes to fit any width of iron
Prices, $1.00 to $1.50 per Pair. For sale to the trade. Liberal discount in quantities.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

Water.—Amador *Ledger*, Aug. 27: In the Bay State the flow of water has become so strong that they have been compelled to adopt the double-bucket system. New rope for this purpose has been sent for, the water in the meantime gaining upon them. The pressure, however, is no doubt merely temporary. The mine continues to look well. We understand 75 cents per share has been offered for the stock. At Bright's claim the prospecting operations have been suspended for a few days. They are down 120 feet. It is the intention to sink to 150 feet, and drift for the ledge at that depth. The hoisting of dirt by windlass at the present depth is found to be too slow and laborious, and steps are being taken to put in a horse whim.

Wheeler.—Claib Wilds & Co. are getting out some rich ore from the Wheeler mine, west of Plymouth. They commence hauling to the Cosmopolitan mill next week. They intend having 200 tons crushed as a test before putting in machinery. There is a company negotiating with Mr. Vaughen for a bond of the Caucasian mine, west of the Bay State.

Quartz Mountain.—The developments being made at the Gold Mountain mine are still encouraging. They have a fine ledge, widening out as they go down. The extent of it is merely a matter of conjecture. They are doing some substantial work in securing the ground. Ford thinks it costs less to put in an extra timber than it would to take out a few crippled miners. The Goodman mine is still in an unsettled state, but the late find on the mount may have a tendency to wake them up.

Oleta.—The mine has started up once more. There are six men at work now, and more are to be put on in a short time, which will liven up our little village.

Butte.

A Bonanza.—Oroville *Mercury*, Aug. 27: Gardner Osgood of Bangor informed the *Mercury* yesterday that the Catskill mine at that place has struck a bed of gravel in the blue lead that is 17 feet deep and 170 feet wide. It averages $5 to the ton. The length of the channel, of course, is unknown. That the blue lead is a permanent institution, and will prove a bonanza, is an established fact.

Bangoa Booms.—Oroville *Mercury*, Aug. 25: Hay & Clark of Bangor blue lead fame made a cleanup this week, and it was so satisfactory that they are putting in five more stamps, and by the end of the week will have 20 in operation. They are also preparing to erect a building 100 by 60 feet over the mine, and also to build bunk and boarding-houses for the miners. The Catskill, Bishop and other mines are also doing splendidly.

Outlook.—*Register*, Aug. 25: The mining outlook in Butte is bright at present. The Pelo Alto Co. is running a cut so as to use only its lower tunnel for getting ore into the mill. The big shaft on the Banner is down 355 feet, and is still being sunk. The Shakespeare mine is being fully developed. The Stow mine is proving one of the richest and best mines in the State. The rock about Yankee Hill is turning out better than was expected, while the mines in the Gravel range section are yielding well. At Bangor the blue lead is attracting more attention than ever, while about Wyandotte it is being sunk upon. There is no mining district but what is doing well, and there is a large amount of prospecting in various portions of the county. From Fall river, at Cascade, on French creek, up on Magalia ridge and in other localities the reports are encouraging.

Calaveras.

Lone Star Mine.—Calaveras *Chronicle*, Aug. 27: We regret to state that the workings of the Lone Star mine at West Point are to be retarded for the time being on account of the failure of water for propelling their air-compressor and 20-stamp mill. Four power drills have been kept pounding away day and night for the past six months driving a tunnel south on the lead from the Mokelumne river level, which will, when driven back to the center of the lead, give nearly 700 feet of backs. Then by a system of upraises connecting the upper tunnels and lateral crosscut to the perallel lead, the Reed & Hillery, will open up the mine in a thorough manner. One chute of ore has been encountered in the lower tunnel, demonstrating the fact that the pay ore "goes down," which fact is most encouraging and insures the mine to be of long life. M. A. Hurley Esq., president of the company, has exercised both courage and good judgment. Being backed by a company that relies on his judgment, we are forced to believe that the Lone Star will duly reward that outlay.

El Dorado.

Mill.—*Mt. Democrat*, Aug. 27: We expect to soon chronicle the event of the clatter of stamps at the Gregory Bros.' mine, Smith's Flat. They have about completed the erection of their mill and will commence crushing at once. They are considerably south of their old works at Dirty Flat, but on the same channel. The boys have cheerful smiles and plenty of good gravel, all of which denotes success, an article we wish them plenty of.

Gravel.—The Stewart Gravel mine, at Webber creek, which is now owned and operated by John Melton, is proving a productive property. This mine has paid more than one fortune in the past, and all indications point to a fortune to come. We sincerely hope that the present management will succeed, for with success they will employ many men and prove a great source of profit to the entire community. The mine and 10-stamp mill are in the hands of competent miners, as the following list will attest: Superintendent, George Cozens; foreman, Charles Henson; millman, Wm. Stafford; miners, John Kern, John Baker, Frank Voss, Frank Pincini, Jos Tunse, Andy O'Neil, Tom Williams, Jim Donovan, Net Jones, John Donogan; carmen, Henry Sprick, H. McCoy, Bob O'Neil and Oscar Bunker.

Taylor.—Georgetown *Gazette*, Aug. 23: The Taylor mine is coming to the front as one of the best equipped milling plants in the State. Quite a village is springing up around it. The mill building and hoisting works, machinery, electric light apparatus, etc., are of the most approved styles and of the most skilled workmanship. The timber yard is large and neat. Two daily stage lines connect the mine with Auburn and Placerville, and a telegraph office gives it still greater advantages of communication. Its water-power advantages are all that could be desired, coming from the California Water Co.'s main canal, at a point just below Georgetown. The entire business is systematically and intelligently managed under the Chapman Bros.

Nevada.

Live Oak Mine.—Grass Valley *Telegraph*, Aug. 27: The owners of the Live Oak mine are taking out some very fine pay rock at the present time. For the past two years the mine has been successfully worked by means of an errastre. The owners recently bonded the property to a well-known mining man, who is about to organize a company and build a 10-stamp mill at the mine. A crushing at the Rogers mill was cleaned up yesterday and the quartz yielded $35 per ton. With a good mill on the mine this property would pay dividends right from the start.

Contract Let.—Grass Valley *Telegraph*, Aug. 20: The Omaha Mining Co. has let a contract to A. G. Chew to run a ditch commencing at a point near Larimer's mill on Wolf creek and to extend to the mine. The distance will be about one-half mile and the water will be used for hoisting and pumping power at the Omaha. It will take about 30 days to complete the work.

Quartz Mines. — Cor. Secramento *Record-Union*, Aug. 30: Your correspondent arrived in Nevada City on Saturday, and spent several days between this little city and Grass Valley. I found the business outlook excellent, and everyone looking for the best season that has been experienced in this section for many years. The bright prospects were in consequence of the renewed activity in quartz-mining interests. Through the kindness of Judge J. M. Walling, I was enabled to get definite information regarding a number of the principal mines in and around Grass Valley and Nevada City, notably the Mountaineer mine, which has been sunk to a depth of 500 feet. This shows an abundance of rock paying $25 per ton, has a 10 stamp mill, and is paying dividends. The Champion mine is down about 1000 feet, employe 60 men, shows plenty of rock paying from $25 to $40 per ton, and is paying good dividends. It has a 15-stamp mill, and is putting in 10 stamps more to increase its power. The Nevada City Quartz mine is down to the depth of 1000 feet, employs 500 men, has a great quantity of rock, a 20-stamp mill, and is paying handsomely. The Providence mine is down 1400 feet in depth. It is an old mine, and is yielding some very rich and a large amount of low-grade rock. It has a 40-stamp mill. This mine in the past has yielded large fortunes to its owners, and from present indications bids fair to outdo its past record, having everything in the way of machinery that modern ingenuity can invent. It employs a large force of men. The Wyoming mine, an old one, is being reopened at a depth of 800 feet, and promises splendidly. The Federal Loan mine has struck a depth of 600 feet, and is just fairly opened upon paying rock, which is of such a quality as to make glad the hearts of its owners. It has a 10-stamp mill, and employe a good force of men. Besides the above there are the Pittsburg mine, with a 20-stamp mill; the Gold Flat, Gold Tunnel, California, Manchie, Charmot, Banner, Spanish, Constitution and Texes, with their mills end hoisting works, being run and prospected to a greater or less extent, giving employment to a larger number of men than were ever before employed in mining interests in this section. All the above, besides many more, are being worked and run by water-power. Taken all together, the outlook for our two mountain towns is excellent.

Siskiyou.

A Rich Ledge.—Yreka *Journal*, Aug. 24: Walters, Mullan & Spencer, of Portland, Or., are working a rich ledge on Siskiyou mountain, near Hilt's sawmill north of Henley, which ranges from 16 inches to five and six feet in width. Some seven or eight men are employed in getting out quartz, and realize from $100 to $200 a day. The mill used is of a new style, with two stamps, worked on the principle of a steam pump, the stamps being on the end of the cylinder shafts, an invention of Mr. Spencer, one of the owners of the mine. The Gold Ball Mining Co., working the old Klamath and other ledges at the Salmon river, is to be reorganized on a more extensive scale, to introduce machinery of the latest inventions for saving gold, in which the present principal owner, Mr. A. Bell, will continue his interest. The quartz prospects well and the ledge is extensive, which can be made to pay handsomely with superior machinery. The sulphurets are also very rich, from which the gold can be secured by proper machinery, instead of going to waste as at present in this and other quartz mines throughout the county. We learn that the miners on Indian creek, above Happy Camp, near Klamath river, are taking out considerable gold this season, and the yield will be equal to if not greater than the usual average.

The Districts.—Yreka *Journal*, Aug. 24: R. G. Dunn, of the State Mining Bureau, sent here by the State Mining Engineer Wm. Irelan, Jr., to investigate the mineral resources of this county, and report thereon, returned from an extended journey of about two weeks in the Scott valley, South Fork of Scott river, Salmon river, Scott river, Klamath river, and all the intervening and adjacent mining districts, highly pleased with the outlook and the certainty of Siskiyou coming to the front as one of the best mining localities on the entire Pacific coast. At Quartz valley, he found that the R. H. Campbell & Co. mining ground, since coming under the menegement of English capitalists, is to be worked in the right manner, by a systematic opening of the entire claim without working in spots. At present, the water supply being light and getting shorter until winter again, preparations are in progress for drifting on an extensive scale, so as to secure the rich pay gravel from bed rock for washing in the flumes when the winter and spring rains fill the ditches for such purpose and for operating the giants. At Oro Fino and vicinity, Pinery, South Fork, McAdams creek, Patterson creek and many other mining localities bordering on Scott valley, he found good mines, and all the miners feeling hopeful of rich rewards in store, and especially in quartz mining, which is becoming very extensive in most of the places above named, including Quartz valley. Going over to Salmon river, Mr. Dunn was highly pleased to see such an excellent road being built over Salmon mountain, and thinks it will be one of the finest roads in the county on completion, as it has a good easy grade and is solid by its construction over rock formation nearly the entire distance. This road will be a great benefit to the mining and farming industries of Siskiyou, by reason of easy hauling of machinery to the mines, besides furnishing the farmers with a market for their produce. In the Salmon country, new discoveries are constently being made in both quartz and placer claims, and still the country is scarcely half prospected compered with other localities in the State. Hydraulic mining is carried on extensively at many places along Salmon river and its tributaries, among which he noticed the well-rigged claims of Spooner & Co., Bennett & Co., and others. He also found rich paying quartz mines on White's gulch, at Black Bear, the Gold Ball claim, and a number of new locations. Along the Klamath are a number of very good hydraulic claims, from Oak Bar and Scott river down to Happy Camp, and also on Scott river, with considerable mining in the river beds. In fact, Mr. Dunn says he saw nothing played out in Siskiyou mining, and that everything seemed to be on its feet, with new mining plants being put up everywhere he visited.

Tuolumne.

More Stamps.—*Independent*, Aug. 20: It is rumored that the managers of the Belleview mine have decided to put in 20 stamps more, and run the mill by waterpower. It is now run by steam, and wood for the mill and hoisting works costs probably $25 a day.

NEVADA.

Washoe District.

Cons. Cal. & Virginia.—*Chronicle*, Aug. 27: There has been extracted from all parts of the mine during the week 938 80-2000 tons of ore, which was shipped to the Morgan mill, the average value of which, per car samples, was $26.61 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $21.88 per ton per battery samples. Bullion now on hand in our assay office, assay value, about $14,900.

Ophir.—1465 level: From the south drift, 101 feet below the sill floor of the 1465 level, at a point 42 feet in from its mouth, the west crosscut No. 2 has been advanced 19 feet; total length, 35 feet; in porphyry with little quartz.

Mexican.—On the 1465 level of the west crosscut, which was started from the drift run north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level near the south boundary of the mine, has been advanced 21 feet; total length, 33 feet, continuing in porphyry and clay.

Union Con.—900 level: The joint Union Con. and Sierra Nevada west drift has been extended during the week 26 feet; total length west from the joint shaft, 2349 feet. The face is in porphyry and small stringers of quartz.

Utah.—340 level: From the end of the north drift (at a point 424 feet in) from the west crosscut from the shaft station, west crosscut No. 2 has been extended 23 feet; total length, 220 feet, continuing in porphyry, clay and quartz.

Sierra Nevada.—The west crosscut No. 2, Kenosha tunnel, started from north drift, 860 feet in, has been advanced 30 feet; face in hard porphyry and stringers of quartz. The joint Sierra Nevada and Union west drift, 900 level, has been advanced during the week 26 feet; total distance west of shaft, 2349 feet; face in soft porphyry and small stringers of quartz.

Annex.—On 420 level: East crosscut No. 1 advanced 14 feet; total length, 88 feet; formation quartz. Repaired the east timbers in main north drift between crosscuts four and five.

Gould & Curry.—During the week we have extracted from the old stopes on the 200 and 400 levels 28 tons of ore, giving a car sample of $18.20 per ton. Sent to the Occidental mill 110 tons; crushed 105 tons; battery assay, $18.06. On the Sutro tunnel level, the joint north drift with the Savage Company has been advanced 10 feet and discontinued; total length, 530 feet.

Best & Belcher.—900 level: During the past week the north drift from east crosscut No. 1, 100 feet from switch, has been extended 14 feet through porphyry, clay and quartz; total length, 102 feet.

Hale & Norcross.—We continue retimbering main shaft above the 1100 level. Main Incline—Are making the necessary repairs. 1800 level—During the week advanced and timbered the north drift 25 feet; total length, 140 feet. The south drift on this level was advanced 25 feet, making its entire length 120 feet. The formation in these drifts is porphyry.

Challenge.—All work has been suspended in the mine since the 21st inst. to permit of repairs to the main water tank and other necessary repairs on the surface.

Potosi.—The northwest drift from the 1800 station, Ward shaft, has a total length of 795 feet; face in hard porphyry. Extracted and sent to the mill during the past week 216 1100-2000 tons of ore from the 930, 1150 and 1300 levels. Milled during the week 170 tons. On hand at mill, 112 1300-2000 tons; average battery assay, $27.26; average car sample assays, $30.20. Shipped to the Carson Mint 335½ pounds of crude bullion. All work in the mine has been suspended since the 21st inst. to permit of repairs to the main water tank and other necessary repairs on the surface.

Ward Combination Shaft.—The joint Alpha and Exchequer south drift from the north line of Exchequer, 1800 level of Ward shaft, has a total length of 423 feet; face in porphyry. The joint Bullion and Potosi northwest drift from the 1800 station has a total length of 765 feet; face in hard porphyry.

Bullion.—The raise from the east crosscut, 320 feet south of north line, 1300 level, is up 25 feet; top in low-grade quartz. The northwest drift from the 1800 station of Ward shaft has a total length of 665 feet; face in hard porphyry. No work has been done in the mine since the 21st inst., owing to the temporary closing down of the Challenge shaft.

Occidental.—From the stopes on 350, 400 and 450 levels have extracted and milled 170 tons of ore of the average assay value of $19.40 per ton as per battery samples. West crosscut No. 4, from north drift, 750 level, has reached the footwall and been stopped. Have resumed driving the main north drift on this level; face in low-grade quartz. The Zadig drift, Sutro tunnel level, has been advanced 21 feet; face in porphyry.

Alpha.—The joint Exchequer and Alpha south drift from north line of Exchequer, 1800 level of Ward shaft, has a total length of 423 feet; face in porphyry.

Exchequer.—The joint Exchequer and Alpha south drift from north line of the Exchequer, 1800 level of Ward shaft, has a total length of 423 feet; face in porphyry.

Con. New York.—The engine is at the head of the winze, 640 level, and work resumed in the winze.

Tuscarora District.

Navajo.—*Times-Review*, Aug. 26: In the stopes above the 350-foot level, the ore continues about the same.

Del Monte.—Have crushed 423 tons of ore, assay $31 per ton. On hand 29 tons of concentrates, assay value (estimated) $236 per ton.

North Commonwealth.—Have crushed to date at the concentrator 423 tons, assay $31 per ton; on hand 41 tons of concentrates; hoisted two cars first-class ore.

North Belle Isle.—An upraise has been started from the south 500 stopes to connect with the 400-foot level.

Belle Isle.—West line crosscut, 250-foot level, extended eight feet through the vein and a drift started south on the rich ore, progress three feet. The upraise from the gangway drift, same level, extended four feet on the ore, which is improving in size and quality; rock very hard.

Navada Queen.—No particular change in the stopes; extracted 32 cars first-class ore, assay value, $260 per ton, and 134 tons second-class; battery sample $24 per ton.

Commonwealth.—Have started stoping from west line drift, seem of high-grade ore exposed, balance second-class. Joint east line drift has been stopped and a drift started east from chute 3, progress 15 feet, showing a little ore in the face of the drift. Hoisted during the week three cars first-class ore, car sample assay $400 per ton, and 139½ tons, assay from battery $23 per ton.

ARIZONA.

White Hills. — Monave *Miner*, Aug. 29: Every mine in the White Hills country is showing more ore than at any time since the mines were discovered. Development but adds to the vast mineral wealth of that section. The Horn Silver is showing much richer ore in the tunnel and shaft than on the surface. The tunnel is in about 30 feet and the shaft has reached a depth of fully 40 feet. William Bohne and William Davis have a carload of ore at the sampler from the Green Linnet mine in Union basin, where they are having it sampled. The ore carries a high percentage of gold. The Home Pastime mine at Mineral Park has six men at work and is turning out large quantities of the richest kind of silver ore. The ore in the bottom of the shaft will average fully 1,000 ounces silver per ton. Beebe's big team hauled out the well-boring machinery for Page & Co., of Los Angeles, who contemplate sinking a well in Gold basin, for the purpose of obtaining a flow of water sufficient to run a ten-stamp mill on the Senator and President mines. Supt. Grant of the Gold Bug mine has just disposed of 150 tons of ore to the Needles Reduction Works. The ore is the second class now on the mine dumps and will be hauled to the river and shipped to the Needles by steamer. M. McLeish has let a contract to sink a four-inch hole in the bottom of his well at White

Hills. The well is now down 55 feet and a four-inch drill will he run from the hottom until water is reached. Mr. McLeish has gone out to White Hills to superintend operations. John P. Burnitt, one of the owners of the White Hills mines, came in from San Francisco this morning. He informs us that the deal with San Francisco capitalists is off, the parties not having come to time. It is thought the properties will hc sold to other parties within a faw weeks. Tbe naw shaft on the G. A. R. mina is down 40 feet, and in tha hottom is exposed tha largest and richest body of ore ever seen in the property, the entire shaft being in ore. The ledgs is the higgest of all the veins in the White Hills, stringers from the main lode covering the whola hillside. P. R. Washington is in from Minnesota district, and from him we learn thet in the Horn Silver mins a strike of the richest ore ever fonnd in that country has been made' Under a limestona cap a ledge of ore four feat in width was fonnd, showing horn silvar and chloride to the value of 800 onnces per ton. The boys are jubilant over their new discovery.

GOLN ORE.—Tombstone *Epitaph*, Aug. 28: Gold ore, as a rule, in southern Arizona carries too mnch sulphurets to mill successfully without tha use of pans and settlers. In the Buckhorn basin, about eight miles south of Fort Bowie, howevar, there exist ledges of gold ore that contain absolntely nothing bsse, and all of the gold can be saved on plates without any difficulty. Owan Williams, who was there in '80, discovered a gold ledge, on which he did soma work. He left it, however, and after sevaral years retnrned and went to work upon it. At a depth of 50 feet he has thres feet of ore that will mill $20 per ton. The ledge is between porphyry and slate. Mr. Williams has intarested Tombstone patties in his mine. Good reports come from Golden Rule district. Bauer and Pearca are down 50 feet on their claim and have a drift in 20 feet. They have three feet of ors between two smooth walls that will retnrn $60 per ton in gold, silver and lead. A second ledge of lively-looking gold quartz, carrying ahout $20 gold per ton, comes into the main ledge abont 40 feet from the shaft, and it is for this point of intersection that the drift is being rnn. Gold ore is heing taken ont, and a carload is already on the dump. In the vicinity of the State of Maine, in Tombstone district, there are in the neighborbood of 30 men chloriding, and all doing well. A carload of ora shipped from the Guiding Star, belonging to Col. Herring, returned $5000. Threa men took this out in a short time. The T. M. & M. Co. is shipping the nsual amount of ore. Sinking below tha water level has been resumed, and tha shaft is now down 115 feet below the water level. Tha water does not bother mnch, and with the pump which is on the way, it will be a secondary consideration. Mr. Staunton says sinking will ba pushed without any let-up until somathing hesides ordinary obstacles drives them out. The crosscut which was run from the 100 lavel below water did not encounter pay ore. Mr. Staunton also states that any lalk ahont shutting down, owing to the low price of silvar, is ridiculous. They have a good balance in the treasury to go on, and if silver gets so low that mining will not pay, and the treasnry is empty, the company may consider the question of going slow, but not until then.

BRITISH COLUMBIA.

SILVER.—Nelson *Miner*, Aug. 26: It is claimed that $2000 worth of ore a day is being taken from the Neosho. One hncketful was seot up the shaft full of wire silvar and valued at $700. Placer-digging at Hall creek is causing quite a little local excitement. Franch Joe and his partner took out over $40 in one day and hetwean 20 and 30 men are at work making from $5 to $10 each a day. Rumors are afloat of a very rich strike on Toad monntain. The Great Northarn qnotas a throngh rate to Great Falls from Kaslo of $8 a ton for ore. Tha shipment of ore from the Skylina, which was sent out with a view to determining the best mathod of treating the ora was delayed for six weeks at Bonner's Ferry. This will cause so long a delay in gatting tha reports on it that it is qnestionable if a mlll can now be pnt up this autumn befora the snow flies. Retnrns from the Helena sampling works show that tba. 600 pounds of ora shipped thera by James F. Wardner from the Freddie Lee mine went 255 ounces in silver and 78 per cent lead. Exploration this fall seems to he workiog easterly and northerly. Prospectors are pushing their way in the direction of the houndary line between East and West Kootenay from Fry creek and from the creeks that fall into Crawford's bay. The country is practically nnknown as yet, hut from present indications it will not be long before rich discovaries ara made in this direction.

LOWER CALIFORNIA.

CEDROS ISLANN ORE.—National City *Record*, Ang. 27: The steamer Farralon, chartered by the Cedros Island Mining Company, brought up one of the largast and richest cargoes of gold ore avar handled hy the company. It consists of 10,300 sacks, or 515 tons. There are still 3000 sacks of choice ore on tha dump, and by the time she returns a large cargo will be ready for shipment. The cargo is being hauled out to-day hy special fraight on the N. C. & O. The works will ha started at once, and with a crushing capacity of 20 tons a day this cargo will keep them running day and night for a month, and it is understood that before that time expires another large cargo will be here.

THE TEPUSTETE IRON MINE.—*Lower Californian*, Ang. 26: Mr. A. Evans, Jr., representing the Oregon Iron and Steel Company of Oswego, Oregon, returned the first of tha week from an inspection of the Tepustete iron mina at San Isidro, 50 miles south of Ensenada. His company operates tha only blast furnace and iron pipe fonndry on the coast, and the plant comprises the finest charcoal blast furnace in the world, as well as the best charcoal-manufacturing plant, which has a capacity of 10,000 bushels a day. The production of the pipe-manufactnring plant is ahout to be increased. The company is one of the strongest iron-manufacturing firms on the continent and has an operating capital of $6,000,000. While there is an abundance of low-grade ore in tha vicinity of the plant, the company is looking for high-grade ore to improve tha quality of its ontput and increasa tha prodnction, and this class of ore, Mr. Evans states, is found on the western coast of Lower California. He was highly pleased with the Tepnstete mina.

THE rumor is current that Capt. Rodda, of tho Princess Company, has made arrangements to operate La Fortuna gold mine at Tanama.

NEW MEXICO.

PYRAMID.—*Southwest Sentinel*, Aug. 23: A full force of men will bs put to work at Pyramid in a few days. Tha Mimhres Consolidated Co. shipped 661 pounds of silver bullion from this plsce to New York last week. Several men are at work at Fleming, and the outlook for that camp is hetter now than it has heen for some time. The new sampler at Deming is receiving considerable ore, and it is thought that a large smelter will be erected there soon. The output of tha mines at Hillsborough last week reached 415 tons. The production of the district is increasing rapidly, and tha smelter and mills there are taxed to their utmost capacity. Work on the Colchis mill has not progressed as rspidly as was expected this snmmer, but Dr. Jenkins says that he expects that it will be complsted before winter. When completed, this will ha a very important adnition to the mills here. The Bremen mill has been in operation a week, hut no cleanup has been made yet. It is expected that the first brick will ba tnrned out about the first of tha month. The mill is running on ore from the Sherman mine, and there is enough on hand for a long run. The Gold Hill mill wss closed down last week, but will commence this week on a rnn of ore from Patterson'a mine. A good strike has been made in McDermott's mine, west of Carlisle. The mine has been producing steadily for some time, and the ore has been treated in the Carlisle mill. Manager Waring of the Flagler Works is uncertain as to when the works will be started. The low price of silver is not very encouraging to miners, and it is doubtful whether ora enongh can ba obtained to keep the works running. They will not be started until a sufficient supply to keep them running is assured.

OREGON.

FROM MYRTLE CREEK.—Eugene Register: The main ditch at the Myrtla Creek mines has been extended a mila and a quarter to tap mora small streams. Washing is not now in progress, but everything is being put in readiness to begin operations as soon as the fall rains hegin. Scarcity of water has always been a drawback to mining operations in sonthern Oregon, but the Myrtle Creek Co. is doing a large amount of ditching to provida water to run the giants the year around if possible. Mr. Holden has completed the excavating on his ditch contract, and is now constructing tha flume and rockwork, which he expects to completa the first week in September. This will complete hia contract, on which he has been at work the past three months or more.

UTAH.

ONTARIO AND DALY.—If indications and a general rumor count for anything, the Ontario aod Daly mines are to have an assistant secretary in the person of a Mr. Skerm. Tha gentleman arrived in the Park a few days ago, and has taken up his quarters at the Ontario mill boarding-honse. He has full authority to visit any and all parts of both mines, and has been indnstriously engaged for some daya making a thorough examination of hoth properties. Tha *Record* has been told, and the rnmor is general, that Mr. Skerm will assume tha dnties of assistant suparintendent on the 1st of September, and tha truth of the matter will come to light on that date. About four years ago the Ontario Co. shipped to Park City from Bozeman, Montana, a large lot of mining machinery, consisting of hoisting engines, pnmps, drums, wire cable, etc. This machlnery has been stored at the lower depot ever since, with the exception of one of the hoisting engines, which was taken to the Ontario machina shops last fall and thoroughly overhauled and placed in perfect working order. This week the engine complete, together with drnms and wire cable, was shipped to Coalville, whera it will ba used by the Home Coal Co. in its mines.

ORE AND BULLION.—The Crescent shipped tbis week 510,000 pounds of concentrates. The Marsac mill shipped on tha 20th 13 hars of hullion, containing 13,672 fine ounces of silver. The Ontario mill shipped 30 bars of bullion this week, containing 18,445.44 fine onoces of silver. The following lota of ora were received at and forwarded from the Mackintosh sampler during the past week: Ontario, 438,800 pounds; Daly, 53,130; May Flower, 589,440; Silver King, 138,970; Anchor concentrates, 227,272, May Flower concentrates, 65,870; Silver King concentrates, 94 920, and Cumberland, 2980 pounds, a total of 1,611,282 pounds.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Snbscription rate, $3 a year. Extra copies mailed for 10 cants, if ordered soon enough. If already a subscriber please sbow tba paper to others.

Market Reports.

Local Markets.

SAN FRANCISCO, Sept. 1, 1892.

Trade the past week was fairly active, with a marked increase in the volume of goods sent out on orders' Upcoast ports have taken quite freely, as have the more distant mining camps and also the agricultural sections. One of the most encouraging signs of the times is the increasing attention which is being given to direct trade by sail with Atlantic and foreign ports. G. W. McNear has laid the Dechmoot on for London, while Balfour, Guthrie & Co., have the Miefield, and H. Hughes & Co., the Glamis, loading for the same port. Balfour, Guthrie & Co., have about finisbed loading the California for Liverpool, and have placed the Dechmont on to follow her, while G. W. McNear bas the Holt Hill up for the same port. John Rosenfeld's sons have the M. P. Grace up for New York, and the Florence and Commodore Allen to follow. Schact, Lemcke & Steiner have the J. C. Pfluger on the herth for Bremerhaven, and J. J. Moore & Co., the Lady Lampson for Sydney, while in the Island trade are the Discovery and Planter in the Hawaiian Line, and the S. N. Castle io the Spreckels Co's Line. All these vessels are taking general cargo.

In the local money market the rates of interest are a shade firmer. There is an increased call for funds with which to make advances on wheat going into warehouses, hut this is partly offset by remittances from the fruit-growing sections and mining districts. The sales of wheat so far this season do not aggregate within 30 per cent of what they did during the like time in 1891. The dividends disbursed in August were a little over $1,100,000 against about $1,200,000 in the like months last year. The disbnrsements for improvements in railroad construction, etc., continue heavy. Eastern financial markets report money hotb on time and call, in full supply, hut rates have a firmer tendency. Exports of specie for the week ending with August 20th were $2,252,000, and since January about $67,500,000, against $85,400,000 during the same time in 1891. Imports of merchandise at New York for the week ending with August 20th were $11,765,000, which is $1,630,000 below those of the previous week. The ease in the money market is reported to he the result of the appearance o cotton hills, which are now heing pressed on the market, In the central States all s'gns point to more active money in September and Octoher.

The cholera scare abroad is doing very much to complicate financial affairs in Europe for the time heing. Late advices report the money centers greatly exercised over the appearance of cholera, and until the virulence of the disease abates there is little hope of affairs resuming their normal con ditions. It is claimed the cholera scare will probably postpone the meeting of the International Monetary Conference, but this report is said to be founded on hints thrown out to feel the public pulse on the question. The London *Economist* in an editorial on the monetary conference, says: "So far as the rehabilitation of silver is concerned, that is foredoomed to failure. But very considerable expectations are heing built upon it in the United States, and when these expectations are falsified, as tbey will be, the apprehensions that are now being excited in the States by the overflow of gold from the country will become intensified. . . . Exactly how matters will move it is, of course, impossible to predicate, hut this much at any rate is clear —that the failure of the conference will discredit silver more than ever, and cause gold to he more sought after, aod that is the cardinal fact which those wbo have to consider the prohable future of the great money markets should keep in view. In the end we believe silver will rather benefit than suffer from the cessation of compulsory purchases by the United States Treasury." Secretary Foster betrays not the slightest apprehension of future trouble, nor will anything be done by him to prevent shipments of gold.

SILVER.—The market has fluctuated at around 83 cts. in New York and 38 d. in London. It is now quite generally conceded that the output of the mines does not meet its world's requirements, and as a result the surplus which has been accumulating, is being absorbed. While this is now a generally admitted fact, yet those in position to know affirm that a moneyed syndicate is manipulating the market value of silver, so as to make successful moves in all securities and commodities controlled hy the price of that metal. If this is the true secret of the present unwarrantable depression in silver, then it is only reasonable to conclude that when the object is secured through the present depression, much higher prices will be in order.

MEXICAN DOLLARS.—The market held fairly steady, hut dull at around 67⅜ cts.

QUICKSILVER.—Receipts the past week aggregate 540 flasks and the exports by sea 75 flasks to Mexico.

BORAX.—Exoorts by sea the past week aggregate 1010 centals. The market is easy at unchanged quotations.

LIME—Receipts the past week were 2858 bbls. There is a fair shipping demand from the Hawaiian Islands. Our market is quiet at from $1.25 to $1.50 per bbl.

ANTIMONY—The market is weak at lower quotations New York mail advices quote as follows: 10⅝@10¾c tor Hallett's, 11¼@11½c for L. X, and 12½@15½c for Cookson's.

LEAD—The market is strong, but the strength of the market is in sympathy with the East, wbere slightly higher prices obtain owing to stronger holding.

PIG IRON—The market does not show any material change. The consumption with us is said to be quite heavy. Eastern mail advices report that at Philadelphia there are indications of an improvement, but Chicago and Cincinnati continue to reflect the heavy pressure upon the market of large accumulated stocks. Pittsburg reports a sale of 9,000 tons of Bessemer Pig from the Mahoning Valley for delivery during the balance of the year at $13 75, the lowest on record. There has also been some movement in Bessemer Iron in eastern Pennsylvania. English advices report decreasing stocks.

TIN—The market for both pig and plate is quiet, with concessions necessary to force sales. The consumption was much larger than bad been expected, owing to an increased pack of fruit. The *Iron Age* reports the New York market as follows: "The market has been a remarkably steady one, although not free from the influence of manipulations by leading foreign operators and their local cohorts. As a redeeming feature it is worthy of record that more tin has been taken for regular distributive trade by local and out of town jobhers, and the movement into the channels of consumption is represented as having heen very fair also, the presumption from which is that the metal is considered by many as being a reasonably safe purchase under 20½c. cash, for near future delivery."

COPPER—The market, which has been heavy and more or less lifeless at the East, and also ahroad, has shaded off. New York advices report a dull market, with quotations hard to maintain. English advices to August 24, report as follows: Copper has undergone very little change. The unfavorable statistical position, together with the condition of the silver market, seems to have checked speculative interest, and weak advices from the Continent have also had more or less unfavorable effect. Business with consumers has, however, been somewhat larger.

COAL—Receipts the past week aggregate as follows: Departure Bay, 3,180 tons; Tacoma, 4,700; Philadelphia. 100; Coos Bay, 450. Total, 8,430 tons. The market has ruled fairly steady, although the yards are only fairly well filled, yet there does not appear to he any signs of an early advance io prices. This is doubtless due to an increase in the list of vessels loading at and on the way from Australian ports, and the large quantity on the way from Europe. The coast mines are prepared to largely increase their output. The consumpt on with us is not as large as had been expected.

Mining Share Market.

SAN FRANCISCO, Sept. 1, 1892.

The Comstock mining shares were more lively the past week than at any time this year. The taking up of an unexpected stock as a leader, making it double its value in a mysterious way, then letting it remain quiet while making another stock active, strong and higher, are incentives which will naturally draw in habitual gamblers, but for investors the moves, while offering some inducements, do not possess the attraction they formerly had; for hitter experience has taugbt that in a game where it is hullion for insiderings and assessments for outsiders, it is, in the end, a losing game. The lessoos of the past have made it a certainty that when a sufficient number of gudgeons buy on promises which are as unlikely to prove true as that a pot of gold will he found at the end of the rainbow, they will find it is a down market, with assessments until the outside is frozen out and the rings get the shares for a great deal less than the collected assessmeots aggregate. It is time enough for the public to take a hand at the game when there is a prospect of the mines being worked and the ore milled according to the laws under which the companies incorporated. The inside ostrich trick of hiding the bead while exposing the body, does not deceive, and until they put others to the front, as reformers, than those who have been closely connected with the rings, the public bad better keep a close eye to the wiodward. The writer will place himself on record, as he has repeatedly done, on the upmoves made within the past five years, hy affirming that when the rings have peddled out a sufficient number of shares, there will follow the usual low range of values—60 to 80 per cent helow the highest figures reached. Of course, the old stale cry of big honanzas and something big near at hand in the share market will he the allurements to keep gudgeons, when in the net, from pocketing what loss or profit, as the case may he, they bave met, and not take the certainty of heavy losses. While raising a warning cry at this early day against the game as now thrivingly carried on, yet the writer tbinks that the ring will have to send the market somewhat higher, before it can induce gudgeons, through their cappers and paid newspaper writers, to load up.

The Reno, Nevada, papers announce the arr'val of concentrates at that place from one or more of the Comstock mines. These concentrates, which are reported very rich and assaying several hundred dollars per ton, are to be smelted at the Reno reduction or smelting works. The question naturally arises: Who will get the hullion? Will it go to the mines to which the concentrates belong, or will it get, as has heretofore been reported the case, into pockets of members of the mill ring? Here is a chance for the mining stock association, and the opportunity should not he allowed to pass. Perhaps the seemingly accidental finding out of the trick may cause the managers to be honest, for this time at least, and turn the bullion over to the mining companies to which it is claimed it rightfully beloogs.

What has become of those reported inside reformers—Wells, Zadig and Hirschfeld? Perhaps they are trying to save 50 cents to the mining companies while allowing the mill rings to get away with $50. Of course, a great hue and cry is made ouer the fact that 50 cents is to be saved, while tha

$50 is lost sight of. It is a great game, this of working the Comstock mines.

An exchange says: "I want to see an improvement in the Comstock," said James L. Flood. "I don't care where it comes; whether it is in any of the mines under my control or in those managed by other people, for no matter where it should be, it will help the whole lode and revive the stock business." These remarks are characteristic of Mr. Flood and show his unselfish disposition " Of course, Mr. Flood, like other mining magnates, works for the innocent lambs of the street, and their unselfishness is probably only equaled by that of the wolf's unselfishness looking after the sheep during the absence of the shepherd.

During the prevailing depression in the mining-share market, the outside mines have been lost sight of. It is said that the numerous assessments have driven a large number (in some cases over one-half) of the shares in such mines into the company's office—bought in for assessments. It is said that when more are secured in this way, and the rings have bought them from the companies, then we are to be treated to a big boom in outside mining shares.

The news from the outside mines is generally of a very favorable character, and it is claimed that if the mines were honestly worked several would be paying dividends instead of collecting assessments.

Public advices from the Comstock mines are more favorable. What the MINING AND SCIENTIFIC PRESS has stated regarding the work in the mines, is now allowed to leak out through the press, but there is much more yet to be told provided the inside can not induce the buying of shares so as to collect assessments while looting the mines. There is not the least doubt but one or more bodies of rich ore are being thoroughly developed to the west, but it is equally as certain that under the present system of working the mines and milling ore, the outsiders will only get the proverbial stone while crying for bread. A Virginia exchange reports very important improvements in Con. Virginia, a better showing in the joint west cross-drift of Sierra Nevada and Union, an improvement in Hale & Norcross, and an improvement in Belcher, but they neglect to give the more important improvements in other mines; perhaps this is kept back so as to get the public to buy stock if what has been said fails. It is now claimed that pumping out of the Gold Hill mines is to be resumed and prosecuted to an early finish. This means assessments, or, if the shares in the Gold Hill mines are peddled out, the pumping machinery may break and the mines be again flooded. It is a great game, the working of the Comstock mines.

Eastern Metal Markets.

NEW YORK, Aug 31.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	38 1-16	83	11 50	4 05	20 40
Friday	38½	83⅜	11 50	4 15	20 45
Saturday	38½	83⅜	11 50	4 10	20 45
Monday	38½	83⅜	11 50	4 10	20 40
Tuesday	38	82⅞	11 40	4 15	20 35
Wednesday	38⅛	82½	11 40	4 15	20 30

Quicksilver is easy at the late decline. Borax is weaker. Pig tin is weaker in sympathy with the decline in silver, and slower movement abroad. Pig lead is stronger under manipulation. Copper is shading off owing to light call from abroad.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING AUG. 23, 1892.

481,383.—BORING MACHINE—G. A. Adams, Santa Clara, Cal.

481,476.—BICYCLE—W. S. Cranmer, Sonoma, Cal.

481,168.—VISE, PIPE TONGS, ETC.—John Ellis, Stockton, Cal.

481.391.—RECOVERING WASTE PRODUCTS OF PETROLEUM—J. P. Engle, S. F.

481,392.—SEPARATING WASTE PRODUCTS OF PETROLEUM—J. P. Engle, S. F.

481,183.—WASHING MACHINE—S. P. Lowell, Eugene, Or.

481,507.—STEAM TRAP—J. McKellar, S. F.

481,411.—HYDRAULIC LIFTING DOCK—Robert Moran, Seattle, Wash.

481,424.—PILLOW SHAM HOLDER—A. J. Robberson, Napa, Cal.

481,427.—LIFE-SAVING CRAFT—A. B. Shearer, Reno, Nev.

481,439.—PNEUMATIC ELECTRIC CIRCUIT CONTROLLING AND INTERLOCKING APPARATUS—Slater & Barnes, Oakland, Cal.

481,312—OIL CUP—J. T. Smith, S. F.

481.214—NUT LOCK—A. Warenskjold, San San Diego, Cal.

481,541.—ROOFING AND SIDING—Jas. Winslow, S. F.

The following brief list by telegraph, for Aug. 30, will appear more complete on receipt of mail advices:

California.—Rawdon Arnold, Sacramento, ice-pitcher; Ulrich Bachman, Mission San Jose, impregnating liquids with gases; Pierre Bourgin, Oakland, bean-thresher; John E. Chappell, San Francisco, laundry drying-room; Parker Crittenden, San Francisco, can-labeling machine; Arthur B. Cruikshank, San Francisco, fire escape; Michael Dillenburg, San Francisco, air-compressor; Samuel Hamilton, King City, threshing cylinder; Jefferson Kindleberger, San Diego, car-coupling; Henry Mathey, South Riverside; reverberatory smelting furnace; John F. Myers, San Francisco, cooking, heating and illuminating lamp-stove; John Richardson, San Francisco, saw filing and setting machine; Ira W. Schofield, Jr., San Francisco, air supply for boiler furnaces; Arthur T. Snell, Ventura, safety pin; Samuel D. Sturgis, Jr., and F. F. Peck, Pratt, game-counter; Edward L. Ward, Santa Rosa, plow.

Oregon.—Andrew J. Coffee, Portland, fire alarm telegraph; Leonard Forsman, Albina, drag-sawing machine; John W. Todd, Portland, saw-tooth.

Washington.—Martin A. Brown, Seattle, toilet paper-holder.

Arizona.—Paula J. Johnson and J. H. Hamill, Globe City, calendar attachment for time-piece.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ROOFING AND SIDING.—James Winslow, S. F. No. 481,541. Dated Aug. 23, 1892. This improvement in covering the sides and walls of buildings consists of a series of overlapping metallic, glass, composition or other plates or shingles having raised ribs or configurations by which the rigidity of the shingle is increased, and a novel means of attaching and securing these plates. These plates or shingles may be made of galvanized iron or other sheet metal, or any composition possessing the necessary qualities of rigidity and permanence. In case the longitudinal corrugations or ribs are not desired, symmetrically raised figures may be stamped upon them, these ribs or figures serving to stiffen the plates, and those which are adjacent to the edges being symmetrical in shape will overlap and fit those of the next adjacent plates, thus allowing the plates to lie closely upon each other while at the same time they are greatly stiffened and strengthened. In stamping and corrugating these plates the inventor gives them a slight curvature from top to bottom so that they will present a concave face toward the wall of the building.

BICYCLE.—Wm. S. Cranmer, Sonoma. No. 481,476. Dated Aug. 23, 1892. This is one of that class of bicycles in which an endless chain is employed to transmit the power of the crank-shaft to the driving-wheel. It consists in a bicycle, the rear or driving wheel of which is made larger in diameter than is usual in this class of machines, and said wheel is driven by two endless chains, one on each side, said chains receiving their power from independent crank-axles located back of the driving-wheel front, thus enabling the saddle of the machine to be set as far back as may be desired. The object of the invention is to provide a bicycle of this class with a large driving-wheel, and by reason of the particular arrangement of its driving connections, provide for the setting back of the saddle as far as may be desired, in order that the weight of the rider may be borne by the two wheels, in proportion to their size.

PILLOW-SHAM HOLDER.—A. J. Robberson, Napa, assignor of one-half to J. W. Hosteller. No. 481,424. Dated Aug. 23, 1892. This is one of that class of holders for pillow-shams in which a movable bar carries the shams and is attached to the head-board in such a manner that it can be depressed to allow the shams to fall over and cover the pillows when the latter are not in use, and is raised to lift the shams clear of the pillows and hold them out of the way when not required. The object of the invention is to connect and support the bar from the head-board by simple devices, which present a neat appearance and which are of such a character that the bar can be fitted to the head-board, no matter what kind of moldings or cornices it may have.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Conrt, Department 10, San Francisco:

OAKLAND AND PIEDMONT ELECTRIC RAILWAY Co. Capital stock, $500,000. Directors—F. H. Meyers, E. S. Denison, W. H. Bailey, W. M. Rank and S. H. Bass. The corporation will soon commence the work of transforming the Meetz-streetcar line to Alameda into an electric road.

OAKLAND SASH AND DOOR Co. Capital stock, $25,000. Directors—T. L. Hierlihy, E. C. Bridgman, W. A. Boscow, C. A. Taber and J. McCnlly.

SANTA CRUZ ELECTRIC RAILWAY Co. Capital stock, $500,000 in 5000 shares. Directors—J. P. Smith, J. H. Horgan, F. W. Ely, W. H Talbot, Morris Newton, H. H. Clark and J. G. Tanner. The presumable purpose of the new incorporation is to absorb both the Pacific Avenue Street Railway Co. and the Santa Cruz, Garfield Park and Capitola Electric Railway Co., and all railway lines in Santa Cruz that may ultimately come under the electric system.

Assessment Notices.

NOTICE OF ASSESSMENT.

KEYSTONE CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Amador City, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22d day of August, 1892, an assessment, (No. 3) of One Dollar ($1) per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room 43, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of September, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 18th day of October, 1892, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. H. ISHAM, Secretary.

Office—No. 310 Pine Street, Room 43, San Francisco, California.

HORACE D. RANLETT,

Ores, Mining, and Commission,

420 Montgomery St., S. F.

Ships under advances to smelting works in Boston New York, Baltimore and Liverpool.

Twenty-five years' experience in Shipping Ores and Managing Mines.

Solicits Consignments of Copper Produce and Management of Mining Matters.

All business conducted on Cash Basis.

Purchase and shipment of Mining Supplies A SPECIALTY.

Sales of Developed Copper Mines undertaken.

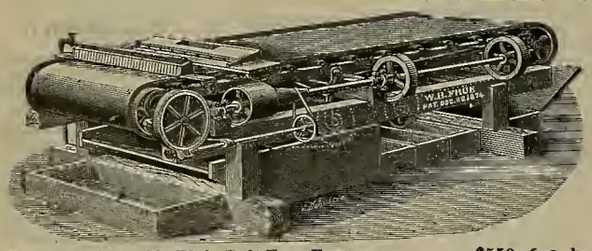
FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.



SAN JACINTO ESTATE, LIMITED,
Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators), extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

For any information, or for pamphlets, or for circulars or testimonials, call on or address

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner ..... 800, f. o. b.
" 6 foot " Plain Belt Frue Vanner..... 800, f. o. b.

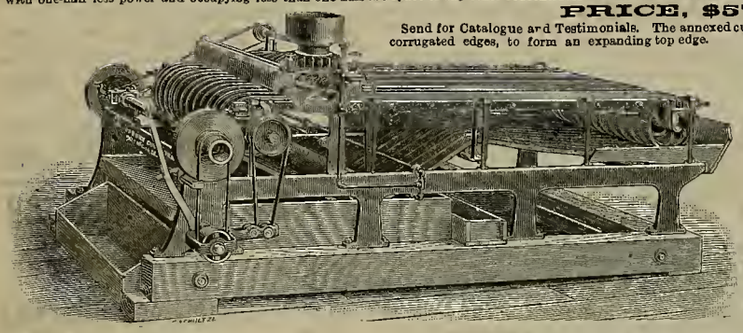
H. J. SUMMERHAYES, Successor to Adams & Carter, Agent for the FRUE ORE CONCENTRATOR,
No. 132 Market Street. - - San Francisco, Cal.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

Was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THE CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of Best Steel and Wrought Iron. Strong and Durable.

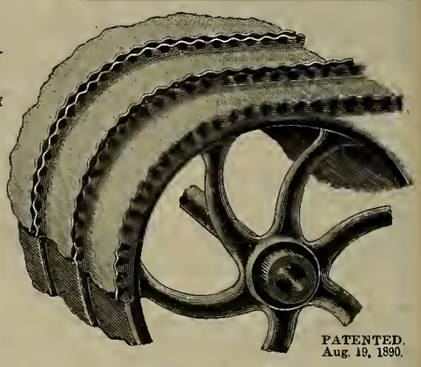
PRICE, $575. f. o. b.

Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge.



THE SAN JACINTO ESTATE—Office of the General Manager. CAJALCO, Oct. 30, 1891.
GEO. E. WOODBURY, ESQ.—Dear Sir: In reply to yours of the 27th inst., respecting the working and efficiency of the "Woodbury" Concentrator placed in our works by you, I am pleased to inform you that it is giving entire satisfaction; it has a much greater capacity than any other machine, and is doing fully one-third more work, with the concentrates equally clean, as from either of the machines at work here
[Copy] Yours faithfully, S. HARRIS, Manager.

THE SAN JACINTO ESTATE, LIMITED—Office of General Representative, P. O. address, South Riverside, San Bernardino County.
CAJALCO, February 17th, 1892.
GEO. E. WOODBURY:—Your letter of inquiry about your concentrator came to hand in due course. Your machine is doing well, the motion is all right, and the machine is giving entire satisfaction. Yours faithfully
S. HARRIS.



PATENTED, Aug. 19, 1890.

CALIFORNIA STATE LIBRARY

Recording Proof of Mining Labor.

A subscriber in Peru mining district, Ventura county, writes us that there is a great deal of dissatisfaction in the different mining districts with regard to the law passed by the last California Legislature, compelling miners to record the annual assessment work with the county recorder of deeds at the county seat. Our correspondent thinks it was a bill pushed through by county recorders, which robs the district recorder of his just dues. "It also makes it very expensive for locators in this district, as we have no one before whom to make affidavit nearer than 40 miles, and it is 100 miles to Ventura, the county seat. Then some men have four or five claims here and keep up the assessment work themselves. As the work has to be recorded in 30 days, it causes such men to make four extra trips to the notary public. The law is unfair and we want it repealed."

It must be confessed that the U. S. Mining laws contemplated the recording of locations, proof of labor, etc., with the district recorders of the mining districts, and this still holds in States and Territories which have not passed laws like California. The Land Office provides that where there is no district recorder location notices may be recorded with the county recorder; but this provision shows that the district recorder is preferred. The object of this was plainly to make the matter easy for the miners. In this State, however, there are many very old districts where there are now no district recorders, that work having fallen to the county recorder by custom. In newer districts, where there are many locations being made, the district mining recorder has something to do; but in regions where most of the claims are patented, the office is one which does not pay any one to hold. The object of the new State law was to make it easier to trace titles to mining property, and to obtain proof of the performance of the labor required by Congress. By having these records at one place in a county instead of a dozen or so, the matter of search is easy. Moreover, the county records are kept in good shape and in proper buildings, while district records may be, and often are, kept in a candle-box in a shake cabin; and if the camp runs down and the recorder leaves, the whole records may be lost.

While, therefore, in distant camps the new law may work a hardship on individual miners, it is plain it is a step in the right direction to place mining property on the same footing, as far as records go, as ordinary real estate in the form of ranches, lots, etc. With the county recorder there is no danger of the records of location, proof of expenditure, etc., being mislaid, and any intending purchaser or lender may find out all about the title of any claim in the county. Very naturally there will remain very little, if anything, for the district recorder to do; in fact, there is no need of a district recorder under this law. An officer already having other duties may perform his also. The U. S. Land Office recognizes the record of an affidavit of labor performed as prima facie evidence of its having been done. The California law recognizes the same thing, except that it requires the records to be made with the county recorder.

The comment of our correspondent concerning the necessity of making four or five trips for affiants on as many claims, because the work must be recorded in thirty days, is based on an error of understanding concerning the law. The California law makes no change whatever in the United States law; it only provides that the work required by the Government law shall be recorded with a county instead of a district recorder. As far as recording proof of labor is concerned, unless the district rules provide otherwise, that may be done at any time during the year in which the work is done. The California law says: "Whenever any mine-owner, company or corporation shall have performed the labor and made the improvements required by law for the location and ownership of mining claims, such owner, company or corporation shall file, or cause to be filed, within thirty days after the time limited for performing such labor or making such improvements with the county recorder of deeds of the county in which the mine is situated," etc. Now, this provision does not mean that the work done must be recorded within thirty days from its completion. It means within thirty days after the time limited for performing the labor, which time under the United States laws, is the first day of January of the year succeeding the date of location, and annually thereafter. Therefore, if the work is done at any time during the year on several mines, the records may be made on all within 30 days after the first day of January.

The Hill-Wheelock Engine.

The Hill-Wheelock engine is similar in design to the Corliss, except that the valves are different. It is specially adapted for electrical work, as it can be run 125 to 150 revolutions and be belted direct to a dynamo. The valve was invented by Edward K. Hill, and is of a new form and construction. The valves are made in sets complete, a frame containing the entire valve mechanism. The cut-off and exhaust valve are on one side, and the live-steam on the other side. In the Corliss engine the valves are at the four corners, so to speak; these are at each corner below the piston. These valves are of the gridiron pattern, and it is claimed that they give the greatest port area of any valve system. While the Corliss engine only has a port area of 7½ per cent of the cylinder area, this engine gives about 18 per cent, which permits a full throttle pressure on the piston, putting the engine among the first in rank in economy. The makers of these engines will guarantee to excel other engines five per cent with the new valve. At a recent meeting of the Technical Society of the Pacific Coast this valve-gearing was described and discussed, and the discussion was printed in the proceedings of the society.

Tests made with these improved engines show a very high degree of efficiency and economy. The Risdon Iron Works of this city have been investigating their merits and intend introducing them here. The engines are built at Worcester, Mass., but will be kept on hand for sale by the Risdon works.

Comment.

More electric railroads are being built and projected in Oakland than in any city on this coast. The city spreads over a large area and extends practically from Fruitvale to Berkeley. It is mainly a residence region and quick transit is demanded from the stations on the steam lines which connect with the ferry system. This accounts for the desire to obtain franchises for electric roads. One has been asked for on High street, Twenty-seventh avenue, East Sixteenth street, Park street and other streets in Brooklyn township, and to this many property-owners object. The protestants give the following as their reason: "Nearly every street in the immediate vicinity of the property where we reside and of large sections of territory to and from which we travel is already obstructed by various kinds of street railroads, and in this connection we have to say that the country is so well occupied and supplied by street railroads that there is no necessity for the construction of another street railroad over the last-named streets. Julia, Howard and Park streets are now lined on either side with shade and ornamental trees. The construction of said street railroad would necessarily result in the destruction of nearly all of the trees and thus mar the beauty of the streets." Speaking of street railroads as "obstructions" is rather odd in a growing town, but the fact is that in Oakland, as in other places, too much latitude is allowed the companies. No sooner is a fine street put in first-class condition than it is torn up for a street railroad of some kind, and in many instances the property-owners do not wish it there at all. As a general thing they want to see it on some one else's street. While a convenience a block or two away from a residence, an electric road in front of one's house is not desirable. There is no ordinance in that city requiring guard wires on the power wires of the roads, but there should be at once. In eastern cities these are required everywhere. If the electric companies wish to keep in favor with the public they should put every safeguard around their plants, and this is a simple and important one. The organized opposition to this projected road is, however, on the ground that a fine street is to be spoiled, it being the general experience that the companies never put the street back in the same order they found it. It is pleasant, however, to note an exception in this respect. The Sixteenth street electric road, from the narrow gauge depot to Fourteenth street depot, was built on good streets, but the space between their tracks is as well paved as that prepaved by the property-owners. If this course were always pursued there would be less opposition to the building of new street railroads.

The gold output of the Witwaterstrand mines in South Africa for the month of July amounted to 101,279 ounces, as compared with 54,920 ounces for the same month of 1891, but a falling off of 1973 ounces from the June product of the present year, which was 103,252 ounces. The output for the first seven months of 1891, however, amounted to but 377,583 ounces. For the same period of this year the total has increased to the satisfactory aggregate of 663,893 ounces, which is an increase of 286,310 ounces, or about 50,000 ounces of gold more than was produced in the whole of 1888, when the Rand mining industry was in its infancy. This is an immense output from one camp. The annual product of these mines now exceeds that of the whole State of California, and this State still produces more gold than any other in the Union. South Africa is doing better in gold production than any part of Australia or the United States.

The old Anti-Debris Association is about to go out of business, as a new one is to be formed to take its place in keeping up the debris agitation. Mr. C. E. Stone, the president, read a report at the recent meeting in which he stated that owing to laws enacted by the last Legislature, and to changes made in the office of the U. S. District Attorney, the directors had been unable to carry on litigation against hydraulic-mining as vigorously as they desired. He did not state, however, that there was a change of sentiment on this whole subject, and that the people and the press of California want to see hydraulic-mining resumed, and that, in consequence, the Anti-Debris Association no longer had the influence it formerly had. Mr. Stone says that the opposition of the Anti-Debris Association to the Caminetti bill defeated it in the Senate; and that the passage of the bill would "annul the decision already made and allow every monitor to resume its work of destruction." How foolish it is to continue with such misrepresentations! No good is accomplished by any such statements. It is perfectly well-known that the Caminetti bill is based on the reports of the U. S. engineers, and it is not intended that any mine may start unless provision is made for keeping the debris out of the rivers. The provisions of the bill require that each mine must be licensed, and licenses cannot be obtained unless it can be shown that restraining works, satisfactory to the Government engineers, have been built. This surely will not "allow every monitor to resume its work of destruction." In fact, the miners themselves think the bill is too severe upon their industry and that only large claims can comply with its provisions. The fact is, the miners' side of this controversy is now being given a hearing by the people and by Congress, and the Anti-Debris Association has had its own way so long that its directors do not like to "let go." If the miners can impound their debris they will be permitted to work; if not, they must keep their mines closed down. But there is no doubt that the Caminetti bill, or some other like it, giving the miners a chance to try the dams, will pass at the next session of Congress.

A. Maltman, agent at Nevada City, for the Portland Smelting and Refining Co., shipped over 200 tons of sulphurets last month to Portland, Oregon, and expects to ship a larger amount this month. He is ready to buy all offered, paying the highest price for them. It is a new thing to ship sulphurets from this State to Oregon. It is stated that the iron is utilized to good advantage by the Portland works, making the sulphurets more valuable to them than to others; hence the price paid. These works would move to some point on San Francisco bay could they make a satisfactory freight rate from Grass Valley and thereabouts to this city. The railroad companies, however, would make no concessions such as have been made by the Northern Pacific to the smelting companies. It is good, however, to find an active demand for sulphurets, from whatever source. Nearly all the gold mills of this State produce more or less sulphurets and these concentrates are generally sold to the chlorination works or smelting companies. Few mines have their own chlorination works, it being only very large companies which do this work themselves.

While local consumers of California quicksilver pay $42 per flask for it, the metal is sold to exporters for $36 per flask. All that goes to China or Australia is therefore sold by producers and dealers for a less price than they charge California gold and silver miners. The duty on the foreign import of the metal is what permits this difference in charges. At the same time, "American goods returned" from these countries pay no duty. Some one in this city dropped on this recently, and when the Monowai came from Australia the other day, she discharged, among other things, 100 flasks of quicksilver, marked as "American goods returned." Somebody had bought these flasks at export rates, shipped them to Sydney, and had them returned here in another name. The freight and handling cost about $150, leaving a profit of $4 50 per flask to the shrewd buyer who can undersell the dealers in the market. Of course the men who handle the bulk of the product of the State will try and prevent this being done if they can, but this is the second instance of the kind.

The establishment of the new lines of clipper ships between this city and New York, for the benefit of merchants here, will be likely to result in some benefit to the miners as well. One of the ships of the new line sailed from this port to New York last Saturday, and part of her cargo consisted of 106 tons of lead, 61 tons of copper matte, and 2020 centals of borax. With a still further reduction in freight rates East, more mineral products would be shipped. The chrome industry of California can only be carried on during the times of low freights. When freight rates are normal, very few mines are worked; but on any occasion when they drop, numbers of deposits are opened and the product shipped. Thousands of tons could be produced here annually if it did not cost so much to bring the ore to market. The miners have received no encouragement from the railroad companies. If the managers of the shipping lines around Cape Horn will stick to a low freight rate to New York, numbers of mines now idle here will be started up again.

At the last meeting of the Academy of Sciences, E. W. Jones, superintendent of the smelting department of the Temescal tin mines, San Bernardino county, exhibited samples of ore, slag, concentrates, refined tin, etc., from the mine and explained the system of working the ore. The specimens exhibited were unusually rich in tin, containing from 8 to 40 per cent of the pure metal. Under the questioning of Theodore H. Hittell, the superintendent admitted that the ore now being worked at Temescal is not near as rich as the specimens shown. The Cornwall mines, however, contain but 2 to 4 per cent of the metal, he said, and are worked with profit, "but no comparison could be made between the two mines, as in Cornwall the deposit is enormous and the labor cheap, while in Temescal the ore exists only in pockets and labor is very high." It may be added to these remarks that very rich specimens are also found in the Cornwall mines, some of them nearly pure tin; but the large deposits of ore run in low grade. The same will doubtless be found to be the case at Temescal. The rich specimens are not abundant. With a large deposit of ore, 4 per cent of metal would make the Temescal mine a larger producer than it is at present. It is to be hoped that the pockets of high-grade ore will be numerous in this California mine, but thus far it must be confessed the amount of production of metal is much less than was expected from it.

The cholora reports grow worse and warse. In Russia the deaths during the past week have numbered about four thousand per day and the plague, which at first was confined almost exclusively to the poorly-fed and poorly-boused peasants, is attacking the middle and upper classes. All hope of checking it is past and the stricken people can only wait and pray for the coming of frost. The disease is rapidly spreading in western Europe, but has not yet become epidemic anywhere except in Hamburg. There the situation is indeed deplorable. The death-rate is now about two hundred per day and is increasing with frightful rapidity. Business is suspended and all who can get away have fled from the stricken city. There is not a considerable city in Europe which is not in danger of just such a scourge. At London, Manchester Glasgow Antwerp, Bremen, Brussels, Havre, Paris—in every city of western Europe, in fact, there are a few cases. Every possible care is taken to prevent contagion, but, in spite of all, the disease slowly and steadily spreads and the danger of universal plague is very serious. The dread disease reached this country on Thursday of last week, brought from Hamburg by the immigrant ship "Moravia." In her passage of thirteen days there had been twenty-two deaths, and at the time of her arrival two persons were sick. Both have since died. The arrival of the cholera at our own doors was the occasion of immediate alarm. The infected ship was sent to quarantine and strict measures adopted to prevent the landing of other ships from Europe. The President, who was visiting Whitelaw Reid at the latter's farm in New York State, hastened to Washington, and on the following day a proclamation was issued by his authority ordering that "no vessel from any foreign port carrying immigrants shall be admitted to enter at any port of the United States until said vessel shall have undergone quarantine detention of 20 days, unless such detention is forbidden by the laws of the State or regulations made thereunder, and of such greater number of days as may be fixed in each special case by the State

authorities." Under this order, the ports of the Atlantic coast are now closed against immigrant ships and against all ships from European ports until careful inspection has demonstrated that they are free from disease. Since the order was issued, a number of other vessels have arrived, some with cholera on board. Thus far, however, there have been no cases on shore in New York, and the quarantined vessels are closely guarded to prevent any one leaving them. The principal cities of the United States are preparing for the advent of the dread disease, and a general cleaning up is going on under direction of the Boards of Health. It is not to be denied that not only New York but all the United States is in imminent danger. The most favorable circumstance is that winter, with its salutary frosts, is not far off.

Foundry Notes.

THE new fire tug for the State Harbor Commissioners was launched on Tuesday at Sixth and Channel streets. She was built by Hinckley, Spiers & Hayes of the Fulton Iron Works and is named the Governor Markham. The tug is 84 feet in length over all, nineteen feet in beam and has a depth of hold of ten feet. She has compound engines, with 16 and 26 inch cylinders, with a 24-inch stroke. She has two Dow fire pumps, throwing eight streams, and having a capacity of 50,000 gallons an hour. The tug is to take the place of the old Anasha, and cost $22,475. The vessel is used not only as a fire-boat, hut as a tug for towing the mud barges from the State dredgers, on the water-front.

KNIGHT AND COMPANY of Sutter Creek, Amador county, have got a contract for building a hydraulic engine and pumping machinery for the Clinton Consolidated mine. The pumping capacity of the engine is to he 2,000,000 gallons in 24 hours. They have also been awarded the contract for putting up a 3½ feet friction hoist at the Hurley mine, West Point. The work above mentioned, and what they have already done in their shops, will necessitate putting on an additional force of men, and keep them busy tbe remainder of the season.

THE Joshua Hendy Machine Works baving their office at 51 Fremont street, and works on the block bounded hy Bay, Kearney and Francisco streets, have at least sixty men constantly employed. Among their specialties is architectural iron| work. In this line they supply a large amount of columns, trusses and such other parts as enter into the construction of modern buildings, furnishing them not only to this city, but other parts of the State. They also build the Challenge ore feeders which still retain their supremacy, and are placed in most of the new mills.

The Triumph ore concentrators also form an important part of their manufactures. Considerable attention is being paid to horse hoists or whims, ore cars and ore buckets, which are of exceedingly good patterns and well adapted for the uses for which they were designed. The Hendy works are using their best endeavors to introduce the new form of band-saw mill which is displacing the old circular saws on this coast, as it has elsewhere. Having worked well on the mixed timber of the southern States, it does even better on the redwoods of California.

GEOLOGICAL MAP.—The United States gelogical survey has been for ten years engaged in making a great map of the United States, parts of which will be on exhibition at the World's Fair. The piece, six feet in length and four feet in width, now ready, includes the State of Connecticut and a bit of Long Island and eastern New York. This vast map will take at least twenty-five more years to complete. Its detail is such that upon it will be indicated every stream, brook, hillock, mountain, valley, farm, village and city. It will show every public and private road as completely as a surveyor's map of a small township. This map when completed, would, if spread out, cover a little over three-quarters of an acre in superficial area. Of course it would be impossihle to suspend such a map as to make it available for practical use, and therefore it will have to be published in sections. In addition to this piece of the map of the United States the geological survey is preparing an outline map of the country, which will also be exhihited at the Fair. It is to be spherical in shape. By it at a glance tbe different elevations, the tablelands, the mouutain ridges and the valleys will be indicated in tbe outline, the highest peaks of the mountains being proportionately elevated as mucb above the sea level as are the peaks of the Rocky mountains above tbe Atlantic and Pacific coast lines.

THE illustration of the great engineering work of the world will he one of the most interesting features of the Transportation exhibit at the World's Fair. Following the announcement that the large and very perfect model of the Forth bridge has been secured comes the application of the management of the Gothard Railway company, of Switzerland, for space in which to show a large model or relief map of that road. This will illustrate in the most graphic manner possible the famous St. Gothard tunnel and the manner in whicb mountain inclines are surmounted by modern engineering sclence.

THE Nevada Silver League is to hold a convention at Winnemucca on Sept. 15tb.

Coast Industrial Notes.

IT is estimated that the deciduous fruit of Southern California for this year will reacb 10,000 carloads, valued at $3,000,000, and that the citrus fruit will reach 6000 carloads, valued at $3,500,000.

THE San Felipe Havana Tobacco Co. has been organized at Gilroy, Santa Clara county, to manufacture the product of Culp's San Felipe plantation; capital, $100,000. P. C. Hodges is president, and George T. Dunlap secretary. Work will commence at once.

WORK bas been started upon a great water storage and irrigating enterprise in Sabino canyon, near Tucson, where reservoirs will be built. There will be three dams, the estimated cost of which will he $80,000. The capacity of these reservoirs, which are in a line one above the other, will he 6,000,000 gallons.

AMONG the most important of the newly inaugurated industries of Humboldt County is the fish hatcheries at Gaston and Redwood. Though still in their infancy the success of the enterprise is assured, and the temperature and surroundings have proven all that is required for the complete propagation of fish.

J. E. SHAFFER, of the La Punta Salt Works, San Diego County, has shipped twenty tons of stock salt to an ice company at Riverside and fifty tons to San Diego, during the last month. Orders have been received for thirty tons of salt to be used in fish-packing at San Diego. The salt is shipped from La Punta to San Diego by sloop.

THE Metropolitan Electric Railroad Company, which has a new line to Golden Gate Park, wants a subsidy of $125,000 for the continuation of its road to the beach, and the Soutb Side Improvement Club is planning to raise the money. The proposed extension would bring the road close to the Ocean House, and six miles of double track would be necessary.

IT is rumored in Wall street that efforts are being made to form another copper copper combination. One scheme is to establish a selling agency for all American copper, and the other to gather in the producers of copper. Efforts were made several months ago to get the producers into an agreement by which tbe trade could he controlled, but they failed to be successful.

WORK is soon to be commenced in tbe paint mine at Valley Springs, Calaveras County. The property is now in possession of a new company, and they intend to put up a large engine and all the necessary machinery at Valley Springs for grinding and mixing, in fact do all the work there that is needed to make the paint ready for use. If the plant is built it will give employment to about fifty men.

THE Rodeo Cold Storage Company has secured a ten-years' lease with the option to purchase, of the four fifty-varas east side Sixth, south side King and north side Berry, from Mrs. Annie Donahue. The South San Francisco Cold Storage Company bas purchased for $125,000 the two fifty-varas northwest corner sixth and Townsend, and leased the property on the northeast corner from Thomas Magee for ten years for $99,000.

THE fall run of salmon on the Sacramento river is the largest known in years. For the first time in three years the canneries have been opened to do business on the full run. The Benicia, Black Diamond and Cbip's Island canneries are running to their full capacity, and will continue to do so for three weeks yet, though the salmon season closed on September 1st. The salmon are now spawning, mostly in the headwaters of the McCloud river.

THE surveyors on the Feather river through Plumas county, are rapidly completing their work. They began on the railroad survey at the Delaney canyon, and last week had finished down through that canyon, through Mohawk valley, Long valley, over the Lee summit, past Spring Garden and along tbe north side of American valley. By this time they must bave nearly if not quite completed the line to Soda Bay where the second party began work.

The Portland Cable Railway, together with all its properties, buildings, franchises, etc., was sold August 30th by the Sheriff to J. P. Marsball, cashier of the Ainsworth National Bank, for $250,000. Six months ago the directors of the road borrowed $200 000 from Marshall, but were unable to pay when the note became due, and the mortgage which was given as security was taken to judgment. The bonded indebtedness of the road is $400,000, and the entire plant and property is valued at $800,000.

THE *Astorian* announces that the Northern Pacific Railroad Company bas acquired by purchase the surveys made for the railroad commonly known as the Gohle road. These surveys are for an extension of the Northern Pacific from Goble to Astoria. An option was recently given on them by the parties interested here. The purpose of the Northern Pacific in acquiring these records is undoubtedly to extend its track from Gohle to Astoria, a distance of about fifty-seven miles.

THE Morning Star Mining Company of Iowa Hill has bought of Coleman Bros., of Grass Valley, the water ditch or canal situated in Placer County, known as the "Iowa Hill Canal," and all the right of way held and used in connection therewith. Said canal bas not been completed according to the original design, hut bas been constructed over a great portion of tbe intended line. It is the intention to convey the completed portion as well as all the right to the grantors to the uncompleted portion.

ONE hundred and thirty-five prisoners were released at Wallace, Idaho. Indictments were found against every one of the miners by the United States Grand Jury now in session at Cœur d'Alene City. It is, however, deemed best not to bring them to trial at present, hut to keep the indictments hanging over them as an incentive to good behavior, Most of the troops will now leave the Cœur d'Alene country. The backbone of the union is supposed to be broken, though the released miners are confident tbey will yet succeed in driving out the nonunion men.

AT Rodeo, the site of the great meat-packing industry, on the San Pablo hay shore beyond Point Pinole, the various buildings are being pushed to completion. Five boilers and an engine are in position, and the machinery for the various departments is being put up by skilled machinists. There are hundreds of men and teams at work on the company's reservoir, which, when completed, will have a capacity of over 1,100,000 gallons. A great deal of money is being spent at the new town.

THE private circular of I. Steuart gives the receipts of coal at this port in August at 82,000 tons, against 87,200 in August, 1891, and 95,020 in August, 1890. The receipts during the first eight months of the year were 794,500 tons, against 856,020 tons during the same period in 1891, and 666,160 in 1890. The circular says: "The coal market during the month has been quiet, without much change in spot prices, although the scarcity of some brands of foreign coal induced holders to ask higher rates. Quotations for future loading of foreign coal show a small advance, but transactions are very limited, as buyers are timid."

THE linemen of the Pacific Bell Telephone Co. of this city have struck because they were not paid on the 4th inst. as per agreement, instead of on the 6th; and they claim also that in all working corporations there is a rule to the effect that employes injured in the company's service shall receive due attention to their injuries, including the benefit of medical attendance and wages as usual; that this company has always refused to follow the general example, and has referred the men to the Employer's Liability Insurance Company, which company has refused to recognize such claims, as instanced in the case of one of their men some little time ago; and that both companies have expressed their intention of fighting to the bitter end any such claim made upon them.

B. M. SMITH, Superintendent of the Visalia Gaslight and Heat Co. has commenced increasing the capacity of the plant. Two tubular boilers of fifty horse-power each have been purchased, and with the boilers now in use will give a battery of four boilers, with a combined 200 horse-power. The engine will he one of the best improved and latest patterned machines now made, and it will he heavy enough if the plant is ever increased. A Thomson-Houston dynamo of 350-light capacity and a Thomson-Houston arc dynamo of 30-light capacity have been ordered. With the dynamo now in use the new plant will have an incandescent light capacity of 1100 lights. The old gas and electric light house is to be remodeled and put in good condition for the new plant. If nothing happens, Visalia will be lighted by electricity about November 15th.

THE Fish Commissioners have made some important distrihutions of young fish throughout the State during the past two or three months. Over 3 000,000 young salmon have been hatched and distributed from the principal State hatchery at Sisson, near Mount Shasta, into the head waters of the Sacramento, Pit and McCloud rivers. This has been done for about one-half of the expense heretofore incurred by the commission in like work. The reduction in expenses has been accomplished by abolishing the office of State Superintendent, and tbe commissioners have taken the duties of that officer on themselves. The hatchery established at Bear Valley, Marin County, has proved a great success. Between 700,000 and 1,000,000 New Hampshire trout have heen hatched at that point, and distributed into the principal streams of Marin, Sonoma, San Mateo, Santa Cruz, Monterey and San Benito counties.

THE schedule of wages for workmen at the Mare Island Navy Yard, as prepared hy the board recently appointed to fix the rates for the present quarter, also with the new ratings, has heen approved and is now in working effect. Persons desiring employment at the navy-yard will be employed under the classes named in the schedule. Should another rate than those designated be required, permission will first have to be obtained from the department after it bas been officially informed of the needs and requirements of the extra rating. This is in accordance with a recent law, under which the classes are scheduled "A" and "B." Class A takes in helpers of all kinds and those without a specified trade, while class B is composed mostly of mechanics, etc. The pay is divided into four rates. An employe is taken on in a department and is allowed say three days to show his ability for the work he has been put at, and then classed accordingly.

THE new works of the Bell Electric Company, a mile and a half northeast of Auburn, Placer County, are ready to start. The water-wheel which runs these works is an interesting feature. The wheel is six feet in height with 15-inch buckets. Two undershot nozzles, one three and a half and the other four inches, furnisb the water, bringing to hear a pressure of about 550 inches. The water has a fall of 72 feet down a steep incline. The combined power of the two dynamos, which run side hy side, is 900 lights of 16 candle power. The company is running almost a full capacity of lights; the forty street lamps just added bringing the total to hetween 800 and 900 incandescents. Mr. Van Frank, of the General Electric Company of San Francisco is in attendance at the works superintending the new machine, which so far has given the company satisfaction. Ed D. Brown, general superintendent of the Bell Company's works, has great faith in some day extending long-distance lines to towns ahove and helow Auburn.

THE franchise for the first electric road in Alameda, has been granted to W. M. Rank. Work on the new road is to commence within six months and it is to he completed within two years. The present horsecar line that runs tbrough Santa Clara avenue and Webster street roadway to Oakland is already heing transformed into an electric road, and the tracks are being laid through Park street that will connect with Oakland over the tidal canal hridge to Fruitvale. The franchise for the new road gives the company the privilege of operating their lines through the following streets: Along, upon and over St. Charles street, Santa Clara avenue, Kings avenue, Morton street, San Jose avenue and Park street, in the city of Alameda, State of California; also along, over and upon Park street, Santa

Clara avenue, Versailles avenue, Central avenue and High street. The provisions added are that the company shall pay two per cent of the gross receipts yearly into the city treasury, and be also subject to a tax not exceeding $50 per year upon the cars in use in the system. The road will also be changed to Santa Clara avenue from Central avenue in the event of the former avenue being opened between Versailles avenue and High street. The new company is the same that recently purchased the streetcar line from Mr. Meetz. It has been reincorporated as the Oakland and Piedmont Electric Railway Company.

THE Northeastern California R. R. Co. recently incorporated intends to build and operate a standard gauge railroad to run from Castle Crag, on the line of the California and Oregon Railroad in Shasta county, and running thence in a northeasterly direction in and through Shasta county to a point at or near the southwest corner of section 28, township 40 north, range 1 east, Mount Diablo base and meridian, in the county of Siskiyou. The estimated length of the road is thirty miles. The Company also proposes to construct and operate a telegraph and telephone line along the railroad. The Directors are E. A. Lancaster of Chicago, D. E Miles and L. D. Brewster of Wisconsin, Henry L. Tatum and J. J. Bowen of the well known firm of Tatum & Bowen of San Francisco, and S. P. Smiley and A. M. Willis of the sime place. The capital stock is $150,000, which has been subscribed. The Directors are members of the Red Cross Company which owns extensive timber interests in northeastern Shasta and southeastern Siskiyou and the route will be the one from Lower Soda Springs or Castle Crag which has already been started for Bartle on the McCloud, the center of the Company's vast lumber interests, where they have built a big sawmill.

Personals.

HENRY T. BUSH has been elected a trustee of the Mechanic's Institute in this city.

HOWARD T. HOLMES has been appointed chief engineer of the State Board of Harbor Commissioners, vice Marsden Manson resigned.

MELVILLE ATTWOOD, the well-known mining engineer and geologist, has been examining some mining properties near Sawyer's Bar, Siskiyou County.

TUSTIN CHENOWETH, of Benecia, who has contributed several interesting articles on popular geology to the MINING AND SCIENTIFIC PRESS and other papers, is visiting the city.

JOHN B. HOBSON, the expert hydraulic miner, who has been for several years in the employ of the State Mining Bureau, is at present engaged in some mining operations in British Columbia.

S. B. CHRISTY, Professor of Mining and Metallurgy at the University of California, has been spending a few weeks among the mines of Grass Valley, with some of the students of his department.

RUSSELL L. DUNN, the Deputy United States Mineral Surveyor of Auburn, Placer County, who has been for some months engaged in field work in Siskiyou and Shasto counties for the State Mining Bureau, has returned to the city.

MARSDEN MANSON, for many years chief engineer of the State Harbor Commissioners, has resigned from his position and has received an appointment as engineer under the commissioners who are to provide a new sewer system for this city.

THE resignation of Mr. George Ohleyer manager of the Anti-Debris Association, which was filed last December, was accepted at the meeting of the Association last week. A new organizrtion is to take hold of the work of fighting the hydraullc miners.

WM. S. DANEY, of Deadwood, S. D., is the last man claiming to have discovered the famous "Lost Cabin" mine. This time it is in the western part of the Black Hills, many miles from a settlement. The discoverer claims to have found a room hewn out of the rock, and in it was a human skeleton and $25,000 in gold nuggets.

W. M. RANK & CO. have applied to the Alameda County supervisors for a franchise for an electric road on High street, commencing at the northerly boundary line of the city of Alameda, thence along High street to the old county road, or Prescott street, thence to Twenty-seventh avenue, to Julia street, to East Sixteenth street, to Howard street, to Park street, and thence to the charter line of the city of Alameda.

A NUMBER of firms doing business on the water-front have united in asking the Harbor Commissioners to grant the Ferries and Cliff House Railway Co. the privilege of running horsecars over the board's belt road as far as the same may be extended between the present terminus of the railway company at Powell and Bay streets, along Bay and East streets to Market street, during such hours of the day as will not conflict with the regular business of the freight traffic of the board's road.

MANAGER FLINT of the Electric Street Railway, owned by the Spreckels Bros. in San Diego, has applied for a franchise in that city to build and operate an electric line across D street at Arctic street. This crossing will give the San Diego, Oldtown and Pacific Beach motor line connection with the street-car line, and it can be operated from the same powerhouse, less than a block from the connection. The line can be transformed to an electric line very quickly, for as such it was built.

PILSBURY HODGKINS, better kuown as "Chips" the vetern Wells, Fargo & Co's. Express messenger, died in this city this week. He came to California in 1849, and in 1851, he carried letters and packages through the mining camps from San Francisco, Sacramento, Stockton and Marysville, to do which he traveled on a white mule. From 1857 to 1870 he was the company's messenger to Stockton and until 1877 to San Diego. Down to 1886 he had charge of the steamer department, and until December 1891, was in the collection department.

The Pine Creek Mines, Oregon.

CORNUCOPIA, Union Co., Oregon, Aug. 29, 1892.

TO THE EDITOR:—In 1885 I left San Francisco to examine the mines in granite mining district, and known as the Pine creek mines in Union county, Oregon, and have remained in the district since that date. The district is 60 miles northeast of Baker city and the same distance east of Union—the county seat.

The district is composed of stratified or secondary granite and slate, and the outcrop of the best veins is from 18 inches to seven feet in width. The ore contains about four or five parts in value in gold to one part in silver, and the average grade of the best mines—that is, of all the ore in the vein—is probably about $15 a ton. But many of the mines contain very rich ore, and have shipped to Denver and Tacoma; in every instance with profit. There are at least nine parallel veins passing through the district, and are traced and located for a distance of 5000 to 12,000 feet each. There is about one-half of the value of the ore contained in the sulphurets, the other half is saved on the plates.

Pine creek runs through the center of the district and contains 20,000 inches of water during the spring and early summer months; through the winter this quantity is reduced to 1,200 or 1,500 inches. In this, I do not purpose writing a report of the district; I simply give a few points so that the mining men of California may have the outlines of a picture of what exists here. Californians are not in the habit of buying mines on representations made by strangers; such buying is done on the reports of mining men in whom they have confidence. Therefore, our object is to have them send such men to our district and make a thorough examination of what there is here, and should such men come, I caution them to pay no attention to anything that may be said against this district, while on their way. The miners—in most instances, God save the mark—of eastern Oregon, have not yet accepted the proposition that a prosperous mining camp in any section of eastern Oregon, would not have sufficient mines of merit to accomodate all who would want to purchase, and the overflow would give an impetus to every mining district in this section of the State.

Should any parties come here, I will take pleasure in showing them the camp. I have mined 19 years in California, nine years in Nevada, three in Arizona, two in Leadville and seven in this camp, and with the exception of Dakota and Montana, have examined and reported on mines for capital in all of the Pacific States, including Colorado, New Mexico and old Mexico. In 1882 I examined the Paris or Treadwell mine in Alaska, in the interest of Senator Jones, and on my report he bought the interest. I was told that all who had made examinations preceding mine, had reported adversely. On my return from the mine the Senator had gone to Washington, and it required ten days for me to bring S. L. Jones up to the buying point. My experience in mining is mentioned to show that I am not likely to remain seven years in a mining camp that has no future. ROBERT KELLY.

Gold Mining on the Fraser.

Reports from the neighborhood of Lytton seem to indicate that something like the revival of the historic period known as the "Fraser river excitement" may be anticipated before long. At a point about three miles north of Lytton, is likely to be the first scene of hydraulic gold mining on a considerable scale. At the placementioned, is situated the Van Winkle bar, where 300 miners, between 1860 to 1863, took out immense amounts of gold. From time to time the ground has been worked over by Chinamen, who are reported to have made on an average $2 a day with their crude methods anda scanty supply of water.

For more than a year past Messrs. de Wolf & Munroe of Vancouver, havehad men out prospecting for the most eligible sites for hydraulic operations. Among several locations which they finally selected as apparently likely to yield good results, was the old Van Winkle bar, about three miles north of Lytton, on the Fraser river. The banks rise in a series of steps or benches, the distance between the levels being on an average about 150 feet. The facilities for bringing water for the hydraulic appliances from various creeks are excellent, while the situation is not unfavorable for the disposal of the tailings or dump. In order to get as much information as possible before actually incurring large expenditure, the syndicate, which Messrs. de Wolf & Munro have interested in the matter, had four shafts sunk and two cuts made to test the gravel and ascertain that the gold-bearing deposit was of considerable area. It is said that the results ascertained by means of this experimental work were very satisfactory, and that a Mr. Hobson, a well-known mining expert from California, who examined the property about two months ago, spoke in the highest terms of it. Two weeks ago he made a second inspection and suggested that a deep cut should be made on the second bench. This was done under his directions, and, as was anticipated would be the case, the old channel of the Fraser river was discovered.

From other reports that have come down from Lytton it is believed that the gravel will prove as rich as any found in Cariboo. Water is on the ground from Last Chance creek, the syndicate having acquired the old ditch and water rights and widened it, so that they will have between 1000 and 2000 inches of water with a head of 400 feet. The ditch is about a mile and a half long, and from the pen-stock there will be 3000 feet of 17-inch pipe, for the present fitted with a No. 6 "Giant" with a 7-inch outlet. This will be sufficlent to put through from 5000 to 8000 yards a day, according to the condition and quality of the gravel. It is expected that work will be actually commenced in October.

The syndicate owns about 660 acres, extending for about two miles along the river. The second bench is about 160 feet above high water mark and the third bench about the same elevation above the second. It is believed by some persons that the mother deposit of the gold which has been taken out in the past will be found in the third bench. Should that theory prove correct, the syndicate has a bonanza.—Kamloops (B. C.) Sentinel.

Dry-Goldwashers.

The Salt Lake *Tribune* witnessed the testing of a placer-gold machine the sales of which are now controlled by a Salt Lake corporation. The *Tribune* says: The machine is the invention of C. F. Willsie, and is constructed with the object of separating flour and other fine gold from sand or concentrates in a dry state, no water being used in its operation. It is composed of two parts, the vibrator and screens, and the quicksilver flume through which the fine sand is driven with great :orce by means of a current of air from a No. 4 blower. In the flume are four pans, the bottoms of which are covered with quicksilver to the depth of half an inch. When the machine is in motion, light agitators revolve in the flume at a good rate of speed, keeping the quicksilver in motion on the surface, thus keeping the surface constantly bright. When the sand is shot through the flume, adjustable gates regulate the flow so that the current of sand may be regulated, according to the capacity of the silver, to catch the gold particles in the sand. The flume is about four feet long, eight inches deep, and 14 inches wide, and the capacity of the machine is 100 tons of dirt per day. In the test made, sand with a known quantity of gold dust in it was passed through the machinery and when the amalgam was retorted, a button was obtained which showed that none of the gold had been lost. Tests have been made of several tons of Snake river sand, and when it was passed through the machine, not a trace of gold could be discovered, the gold all being in the silver pans in the flume. The machine seems to do the work thoroughly, and if it is what it seems to have proved itself, the gold product from placer-sand will be largely increased. It is probably the only dry-operating machine which is a complete success, and a dry-machine is what has been wanted for years. Mr. Willsie has spent many months perfecting his machine, and is highly gratified at his success. The machine is very simple in construction, and can be run to its full capacity by a two-horsepower.

A correspondent of the Santa Ana *Blade*, in describing the Silverado mines in Orange county, has the following to say about a dry-washing machine or concentrator on the Bluelight mine:

The Bluelight mine is owned by Dunlap, Hopkins & McGuire. We were fortunate in finding Mr. Dunlap at the mill, and he said:

"I located this mine over 12 years ago, and have been working it off and on during that time. I have always known that it would pay well to work the Bluelight, but have been hampered by the barrier of no money to push my operations. Now we are on the highroad to success, and I have no doubt but that in a short time talk of the wealth of the Silverado mining district will be heard all over California.

"The mill we have now put in is not the one we intend to use, for we are having a large one built. When it is ready we will be able to handle ten tons of ore per day."

We were then introduced to J. B. Freeman of Los Angeles, the inventor of Freeman's dry-concentrator, and a most agreeable gentleman. He showed us the entire workings of the mill.

The ore is brought from the mines in sacks and piled up back of the mill. On the second story of the mill is the orecrusher, and into the first pulverizer the ore is fed, this breaker taking rocks as large as an orange and crushing them until they are about the size of a walnut. Lower down is the second crusher, and into this passes the crushed rock from the first pulverizer. This crusher grinds the rock into bits the size of a pea, and these pieces drop down between two iron rollers and are rolled into powder. The powder is run into a sieve and then into the dry-concentrator and on to an endless belt. This revolves, and a bellows run by steampower, and having regular pulsations, causes the gangue or waste matter to go to the surface of the belt, which is of fine wire, and the metal to sink, and by the revolution of the belt the gangue is separated from the metal, leaving it nearly free. The capacity of the rock pulverizer is ten tons per day, while the concentrator has a capacity of five tons per day of 24 hours.

The ore concentrates well, the concentrates being galena and iron, and about 15 tons of the ore is reduced to one of concentrates. These concentrates are used in large smelters in working dry ores, and are much sought after for that purpose. They will bring their assay value, no charge being made for separating the precious metal.

There is no doubt but that the work done by the dry-concentrator is of a high order, and Mr. Freeman's invention will revolutionize mining in this country. The one great obstacle in the way of successfully opening mines has been lack of water, but Mr. Freeman's dry-concentrator does away with this and removes the only barrier in the way of successfully mining in a country where water is scarce and minerals are found.

This is the first mill of the kind yet operated, and Mr. Freeman and the owners of the mine are highly pleased with the work it does.

The distance to Bluelight mines over the road now traversed is nearly 26 miles from Santa Ana, while by an air line we are only 11 miles from the mill. If the work proves as profitable as it is expected, a wagonroad will be built over the mountains to Tustin, a distance of only 14 miles, and over an easy grade, which will be of great saving in the cost of transportation to and from the mine.

The Mines of Plumas County.

By our Traveling Correspondent.

SIERRA VALLEY, Sept. 1, 1892.

TO THE EDITOR:—To many of the people of the State, Plumas is a wild, forbidding county, inviting only to the hunter or the fisherman. Little is generally known of it beyond its geographical location on the map, and to those who have thought of going thither no railroad seems to approach within many miles. This latter is about the one fact the unkoowing outsider does know.

It is to the present insufficient means of communication and transportation that this general misunderstanding is due, and offers the reason for the tardy progress of the county compared with other portions of the State. Plumas is doubtless the richest in varied natural resources of any of the mountain counties of California, and few counties have their resources less developed. Its mineral and timber resources are generally known though they have by no means received the recognition they deserve, and it cannot be expected that they will until the county is put in better commercial contact with outside markets.

It is the same with the agricultural products. Scattered through the mountains are many of the most fertile and beautiful valleys that can be found anywhere in the State and perhaps in the world. Such are Big Meadows, Indian valley, American valley, Mohawk valley, Sierra valley, each comprising an area of from 20 to 100 square miles.

Farms vary in size from 50 to 1000 acres, and one considering Plumas mountain farms must first overcome the impression that they are all of the "perpendicular" type.

Plumas is not a citrus region, with from five to seven months of winter, but what may be raised can be produced in abundance. It has remained largely and necessarily self dependent, to produce much that it needs and to consume what it produces. Heretofore, the only market for these products has been the mines, and with that industry prosperous the rest of the county thrived. But on this mining question I may have more to say another time under a heading, were I to label it, "A Plea for the Small Hydraulicker."

Two things the people of Plumas look forward to, prayerfully and hopefully—the resumption of hydraulicking and a railroad. Which they wish most is scarcely distinguishable, though the actual coming of either is, perhaps, equally remote. But the surveys now being made through the county have brought about a confidence amounting to conviction that the road has really come. It is certainly a question of immense importance to the county, for with railroad communications an immense region would be opened up for settlement and development, and naturally the mines and mine-holders would be the most benefited.

We could then look confidently to Plumas as the great mining region of the State. Much of the country has not yet been explored and none of it prospected thoroughly. Many with small means are holding good properties until improved and cheaper facilities of transportation will permit them to proceed with their developments, or bring in others with more means than they possess. Numerous places known to be rich in mineral, and which under ordinary circumstances in a more ordinary country would long ago have been worked, lie waiting a first locator.

During the past year or so the mining industry in Plumas cannot be said to have advanced greatly, if any, though there is the continual prospect and hope that something shortly will happen.

With the closing down of the hydraulic mines there was nothing left, with one or two minor exceptions, but the quartz interests.

THE PLUMAS EUREKA.—Principal among the mines of this character is the famous Plumas Eureka, situated half a mile, on the vertical, from Johnsville, in the southern part of the county. For 40 years this mine has been working steadily and has paid to its English stockholders nearly four millions in dividends. Owned by the same company interested in the Sierra Buttes mine, the same policy was adopted in both of not being in a hurry to work all the good rock at once. They struck a fair dividend-paying average and stuck to it. When the ore ran to high grade it was "diluted" with low-grade rock, and conversely, with the striking of a big body of poor-paying ore its average would be raised by an infusion of better-quality material. When pay rock was scarce, fewer stamps were necessary, and thus the mine has run on steadily for so long that it has come to be considered inexhaustible. In times past the mine has yielded as high as $70,000 a month, and at present averages $15,000. For a year past 15 of the 60 stamps have been hung up. The average of the ore worked at present is $4.85 per ton.

The mine is considered, even by those interested, about worked out, as continual prospecting during the past two years and honey-combing an immense amount of ground fail to discover new chutes such as the mine possessed formerly, As in the Sierra Buttes, there is a limitless amount of quartz, but little bearing gold.

The quartz ledges of this mine are highly interesting and quite as inexplicable. There is a total absence of regularity, one with each other, and even in the same ledge. One ledge will assume a vertical, a dipping and a horizontal position by turns, and seemingly parallel ledges will dip toward or from each other. For sometime past work has been confined to the old "'76" tunnel in the upper works and the old Mammoth tunnel of the early Eureka claim. The mine continues to pay, as the moment it ceases to it will be shut down. Since visiting the mine I understand a rich chute of ore has been struck near the old "'76," which may mean a new lease of life.

THE JAMISON.—It is on this mine that the future of Johnsville and that entire mining region may be said to depend. It is situated a short distance from town and the Eureka, on Little Jamison creek. This mine is owned in Philadelphia. S. W. Cheyney, a capable young man and mining engineer, is superintendent. While this mine has all the prospects of being a big one, if it but gets a show, Mr. Cheyney candidly admitted that at present he was not encouraged to speak praisingly. Ninety thousand dollars have already been expended in developments. These consist principally of a drain tunnel, 1700 feet long, running from the junction of Jamison and Little Jamison creeks to the ledge, and a shaft raised at that point to the surface, about 200 feet. The ledge where it has been opened up averages four feet; the ore is low grade.

The erection of a mill depends entirely on what may be found later. Several fine, substantial buildings are on the property, and only the discovery of plenty of good ore is necessary to make it a worthy successor to the Eureka.

Eight miles west of Mohawk, on the Quincy road, is the Consignee gravel mine, owned in Pittsburg, Pa. A tunnel 2100 feet in length has been run to tap a blue-gravel channel. Mr. P. E. Traynor, the superintendent, says they are sufficiently encouraged to go ahead, and in time hope to have a mine.

Mining about Quincy, Spanish Ranch and Meadow is very quiet indeed. A few placer claims have been worked some the past season, but have closed or want of water.

THE SHENANDOAH.—Twelve miles from Quincy, at Rich Bar, on the East Branch of the North Fork of the Feather river, the Shenandoah Quartz Mining Co., an Oakland corporation, is operating a ten-stamp mill. Mr. Samuel K. King is superintendent. I. B. Whiting, one of the directors, stated that at present they were engaged in making a ditch from Clear and Mill creeks to the mine. The mill is a mile and a half distant, so far that work in the winter is now impossible. They intend moving it, consequently, to the immediate vicinity of the mine. Mr. Whiting reported the prospects flattering. The trouble, however, with the paying quartz of this section is that it has generally been found to lie in "pocket ledges." The Shenandoah may be an exception.

THE GOLDEN GATE, situated eight miles west of Quincy, is at present being operated by Jacob Stephan and Charles McLaughlin under a three years' lease. The mine is the property of J. B. Sutton and four associates, who erected a five-stamp mill a year ago. This spring, however, this mill was taken down and a new mill of ten stamps erected. The ledge is what is known as a "blanket" or horizontal ledge, and is worked from the surface. It averages three feet in thickness. The rock worked last fall is claimed to have run $9 a ton.

THE FALL RIVER CONSOLIDATED.—This quartz mine is situated in western Plumas, 14 miles from Forbestown, on Fall river. Owing to its isolation, I did not visit it, but Mr. J. C. Wolters of Gibsonville, the president of the company, furnished the following statement. From this and what else I could learn, it is doubtless one of the promising mines of the county. The company controls four claims, two of which have been patented. The work of development has gone on steadily for the past four years. The ledge is opened up by two crosscut tunnels, the first and upper of 115 feet and the lower and working tunnel 790 feet. This latter is through bedrock and was driven by hand at an average cost of $25 a foot. A 4½ foot vein is here shown with 325 feet of backs.

Mr. Wolters showed some handsome specimens which he claimed were not above the average run of the rock. He had just received returns from Thomas Price's assay office, on similar rock, which, should it prove a continuous milling ledge, ought to satisfy most any of us. According to this, it was $63 00 in free gold and $5 30 per ton in sulphurets. A bonanza, surely—if there's only enough in it. A 10-stamp mill is being erected, five stamps of which are now in position and working to good advantage and profit. Mr. Hector Forbes is superintendent.

THE DIADEM MINE of J. A. Edman, four miles south of Meadow Valley, has undoubtedly been the richest quartz bonanza in Plumas. Though idle at present, it can by no means be said to be worked out yet, and is not believed so to be either by its owners. The sums that came out of this mine, in places the size of a candle-box, seem incredible. Not infrequently an afternoon's prospect yielded from one to five thousand dollars. The mine has been developed by about 3000 feet of tunnels, and by a shaft 300 feet in depth. A great portion of this shaft, Mr. Edman's states, averaged $1,000 a foot. The lode is from 50 to 120 feet in width, with an average of 60 feet. It courses northwest and southeast, with a dip of 60° from the horizontal. Its character is decomposed rock, carrying quartz, talc slate, oxides of iron and manganese, dolorite, etc. The average width of the milling rock is 20 feet, the pay chute generally following the footwall. In this mine the footwall has been found to be very rich in coarse gold to a distance, sometimes, of five or six feet from the ledge. The sulphurets in the quartz are generally decomposed and form about three per cent of the ore, though the gold as a rule is free, but in very minute particles. An important discovery has been made on the 300 foot level of a rich though unfortunately limited deposit of gold tellurides, running from $20 to $500 per ton. This is the only mine, to my knowledge, in this section of the State, that has been found to possess this valuable compound.

For three or four years the company has endeavored to work the ore through two Huntington mills—one of five feet, the other three and a half. This has been entirely experimental. After extensive researches, mainly by the aid of the microscope and by practical milling tests under different methods, and on ores in quantities of fifty tons and upwards, Mr. Edman has determined on a total change of the milling system, and will erect a new plant this fall and next summer, by which he hopes and expects to obtain a larger percentage of gold.

Mr. Edman is a scientific man, a geologist and microscopist, of more than local reputation. Besides writing much, he prepared some years ago a map showing the geological formations of western Plumas, that represents great care and study, and is of particular importance to miners as well as students, giving a splendid basis for further work in the same field. It was published by the State Geological Society.

About two years since, Mr Edman suffered a severe loss in the destruction of his house by fire, and by which he lost one of the finest and most valuable cabinet collections in the State.

AT CRESCENT MILLS both the Green Mountain and the Crescent are quiet, as far as milling is concerned. At the latter, Mr. W. H. Whitney, the superintendent, candidly confessed they had nothing at present to talk about, but they are at present sinking 200 feet deeper and crosscutting, with hopes of striking a paying lead. The company met with a serious loss this past spring in the burning of their hoisting works. However, new and more efficient works have been built, new pumps put in, and everything is now in first-class condition and only waiting for the strike.

Mr. G. P. Cornell, superintendent and owner of the Green Mountain, is working a large force of men underground. The tunnel they are in now is 1 mile and 800 feet in length and it is expected that another 800 feet will tap the ledge 5100 feet in. An upraise of 600 feet has been made to give ventilation. Mr. Cornell expected to have his 60 stamps running again by the first of the month, as he claimed he had plenty of ore in sight. This mine, unfortunately, has been so entangled with stocks and "johs" in the past few years, and with unpleasant rumors of the amounts due men, that it has received a "black eye" in the public estimation. It is to Mr. Cornell, if to any one, that we look for a remedy, or a refutation.

At Genesee, a few miles east of Taylorville, Jos. Gruss has a small mill on a fair-paying ledge. This locality, however, I was not able to visit. Near here, I understand, there are several good prospect claims.

With too many prospectors there is this fault: If they discover a good thing they lack means to carry it forward, and believing they have a bonanza, demand such figures that they turn away rather than attract capital. Mine-buyers nowadays want no fancy tales; they want a developed mine if they have to pay for one, and too many of these high figured holes in the ground, while they may have millions in them, are not really worth the demanded price. For instance, in this locality is a rich copper ledge, carrying also considerable gold. The owners are anxious to sell and there have been a number of parties anxious to buy. As a rule, those who are desirous of securing a property will pay all it is really worth in the condition it may be, and whatever they should offer, it would be more money in all likelihood than the prospector would otherwise ever get. Even though he should not get as much as he thought was righteously his, it would amply repay his labors and enable him to start out to discover new fields. It is too often analogous to Æsops' "dog in the manger."

At Gillville I met one who was among the first to realize on the Bodie excitement of some years ago. One day there came to him in that town of "bad men" a sheep-herder with some peculiar-looking ore specimens. No one that the man had shown the ore to knew what it was, but at a glance my friend knew it to be a rich carbonate. Accordingly they located it, and each went again about his business, one of herding sheep the other as a millwright. Shortly after, two young Englishmen came into that section in search of mining properties and were attracted by these same specimens. They asked how much was wanted for the claim, and were surprised on being told that they could go look at it, prospect it if they wished, and when satisfied pay what they thought was right. Two weeks later the locators received a check for $10,000, and the mine developed into one of the bonanzas. Both the carpenter and the sheepman were previously poor men. The herder immediately put his money into sheep, and is now rich. The other built a five-stamp mill on another claim he possessed, and the mill burned a week after it was completed. But that is another story. Prospectors may choose their own moral.

The 40-stamp mill of the Indian Valley mine has been idle for the past two years. This is the property of S. P. Prentiss of S. F. The mill is said to be the finest equipped in the State.

THE STANDART & MCGILL, 3 miles west of Greenville, is running its 20 stamps steadily. At present the ore is hauled half a mile to the mill. The mine includes 3500 feet of patented ground developed by two tunnels 850 feet and 1400 feet in length. Work at present is being carried on in the latter. Mr. Geo. Standart, superintendent, had little to say, as the mine is "not for sale."

JOHN BULL.—Toward town and adjoining the Standart is the John Bull. This is the property of its three original locators, Messrs. Firmstone, Richards and Cozzallo. They are running five stamps and taking their ore from an average 10-foot vein, reached by a 400-foot tunnel. The ore averages $6. Since visiting the mine I understand the mill has shut down temporarily.

ALTONA.—Mr. F. F. Emmons is using the 10-stamp mill of the Round Valley Consolidated to crush the ore of his Altona mine. As this necessitates hauling the ore a distance of nearly two miles, he intends soon to erect a mill on his own property, to be run by steam. The size of the mill will depend on the output of the mine. The mine at present is developed by a 400-foot tunnel, disclosing a 9-foot ledge which averages $7 a ton.

BLIND LEAD.—D. McIntyre has about completed his 10-stamp steam mill at Wolf Creek, nine miles northwest of Greenville. His mine is known as the Blind Lead, and is in the once famous Gold Stripe district. The two Gold Stripe mills of Geo. Standart, one of 15 the other of 24 stamps, are still standing idle, the ledge having been worked out.

There is a promise of something interesting with the opening of the McIntyre mine, as his ledge is said to be nothing but a "slip" covering an already located gravel claim. Whether the ledge be a true one or not, it is to be regretted that there is the prospect of litigation even before the work has begun.

THE SAVERCOOL MINE, ten miles south of Prattville, on the North Fork of the Feather river, is running its 40 stamps steadily, and is said to be paying well. Alex. Cameron is superintendent.

The famous Dutch Hill hydraulic mines are now quiet necessarily, though Gen. Chipman has recently secured a bond on them by which they are to be operated by drifting.

CHAS. E. TOWNSEND.

Scientific Progress.

The Acids of Fruits.

We know that many vegetable and fruit products are esteemed rather for their pleasant or refreshing taste, and for their antiscorbutic properties, than for any nutritive value which they may be assumed to possess. Yet even fruits of that character are especially valuable as additions to our daily diet, on account of the potash salts and mild vegetable acids they contribute to the blood. We learn from Johnson's *Vegetable Food of the World* that the grateful acid of the rhubarb stalk arises from the malic acid and binoxalate of potash which it contains. The acidity of the lemon, orange and other species of the genus citrus is caused by the abundance of citric acid which their juices contain; that of the cherry, plum, peach apple and pear from the malic acid in their pulp; that of gooseberries and currants, black, white and red, from a mixture of malic and citric acids; that of grapes from a mixture of malic and tartaric acids; that of the mango from citric acid and a very fugitive essential oil; that of the tamarind from a mixture of citric, malic and tartaric acids; the flavor of asparagus from aspartic acid, found also in the root of the marshmallow; and that of the cucumber from a peculiar poisonous ingredient, called fungin, which is found in many species of fungi, and is the cause of the cucumber being objectionable to some persons.

It will be observed that rhubarb is the only product which contains binoxalate of potash in conjunction with an acid. It is this ingredient which renders rhubarb so wholesome at the early commencemet of the summer, though in certain cases, known to medical men, its use may be injurious.

The following table, compiled from some analyses by Prof. Berard, shows the percentage average chemical composition of five unripe fruits and of eight ripe fruits, comprising apples, pears, gooseberries, grapes, plums, cherries, apricots and peaches :

	Unripe	Ripe.
Water	85.7	78 7
Albuminoids	0 7	0.6
Sugar	4.0	12.9
Vegetable a ids	1.5	1.3
Pectose aod gum	4.3	3 7
Cellulose, etc	3.8	2.8

The data thus given show that there is a considerable decrease in the watery particles of fruit as it approaches its full ripe character, resulting in a difference of 7 per cent, while the sugary constituents increase during maturation in a corresponding degree, rising from an average of 4 to nearly 13 per cent.

There is very little actual decrease in the percentage of acids from the green to the ripe stage of fruits, but the acidity becomes neutralized by the increase of sugar as the fruit approaches maturation.

Many persons know from experience how much more pleasant and agreeable fruit is when gathered and eaten direct from the tree. This is undoubtedly in part due to the freshness and briskness of the vegetable acids contained in the fruit, which, when so gathered and eaten, have not time to change into any other substance. Stale fruit, on the other hand, is unpalatable from the very fact that it has lost this pungent and brisk taste.

Pectose forms the substance known as vegetable jelly, and it is to this constituent of fruit that jams owe their firmness. Cellulose is the fibrous part of fruits, and it is in this portion that we should find the largest proportion of mineral salts, potash, etc.—The Gardener's Chronicle.

The Latest New Explosive.

A new explosive compound is being developed by Prof. Silas R. Divine, chemist to the Rand Drill Co., and well known as the inventor of rackarock. Its peculiar virtue, says the *Engineering News*, is that it is not exploded by concussions of even the most violent character, hut yields readily when a fulminate of mercury detonator is applied. In appearance the explosive is a yellowish powder of high specific gravity. It does not deliquesce and does not have either picric acid or nitrate of ammonia as its active principle. In some recent experiments quantities of the new explosive were placed on a rock and pounded with a heavy sledge-hammer without causing explosion. A shotgun was loaded with a powder charge, and on top, separated only by a thin paper, a half ounce of the new explosive was placed. The gun was fired at a wooden box and portions of the explosive were found imbedded in a scantling inside the box. An old 18-pdr. carronade was next charged with 1½ lbs. of black, blasting powder, and a shell made of linen and tarred cord was filled with 3 lbs. 9 oz. of the new explosive and fired vertically in the air. The shell was arranged with a time fuse terminating in a fulminate of mercury detonator. When fired the shell rose to an altitude of about 2000 ft. and was exploded by the fulminate at that altitude. In another experiment two pieces of 1½ in. iron pipe about 7 ins. long were each filled with the new explosive and buried in the earth side hy side. One of the tubes contained a fulminating cap; the other did not. The first tube was exploded and torn into small hits. The tube beside it was split open and hadly smashed, but the explosive which it contained was unaffected.

These results indicate that the new explosive may be of especial value for military purposes, as it may solve the problem on which Dr. Justin has long heen laboring, and with no small success, of firing shells containing a high explosive with ordinary powder.

Taking the energy of No. 1 dynamite as 100, the energy of this explosive is 86 per unit of weight or 138 per unit of volume. The high specific gravity makes it especially suitable for packing shells and bore-holes, as great power is concentrated in a small space. It is not expensive or dangerous to make in comparison with other high explosives. It does not appear liable to injury or change in character from extreme cold or moderate heat, but, like all forms of powder, is nonexplosive when wet. It is proposed to call the new explosive Randite.

Decoration of Metals.

A new and interesting method of decorating metals is thus set forth in the *Journal of Useful Inventions:*

The decorative design is formed upon the metallic surface by means of etching and oxidation of the metal. Suppose the plate to he decnrated to consist of polished sheet brass. The operator takes the polished plate and covers with a hrush, dipped in a suitable varnish, all those portions of the design which are finally to appear as polished surfaces, the high lights or perhaps the outlines of the design. When the varnish is dry, the plate is immersed in a hath of nitric acid somewhat diluted, in which is a small piece of copper in process of dissolution. By this immersion, the surface of the plate is both etched by the acid and discolored by the action of the copper which is dissolved by the acid. After immersing for a few minutes, the plate is removed and rinsed. As it dries in the air, the exposed surface becomes a dull brown, like old bronze. The operator then paints with the same varnish all the portions that are to retain this color, and then dips the plate in a weak solution of copper salt.

This brightens the surface and gives it a yellowish, mottled appearance. Then the plate is dried in fine sawdust, boxwood preferred. After protecting with the varnish such of this color as it is desired to retain, the operator immerses again the plate in the same nitric acid bath until it has been sufficiently etched to remove the previous oxidation, again rinsing and holding it, either side up, over a tray containing diluted nitric acid and pieces of copper and sheet brass. After having been left to be oxidized in these fumes a few moments, the plate is again dried in sawdust, and the result is an orange color somewhat mottled. Again painted and exposed to the fumes of the acid, copper and brass, for a longer time, a green color is produced. Again dried in the sawdust and painted as before, a frosted effect is produced on the unpainted portion that is left by a quick dip in a hath of nitric or sulphuric acid and water, after which it is rinsed and dried quickly in hot sawdust.

Now the operator removes the varnish with turpentine or another solvent, and the entire design is exposed, and the plate is completed.

It is immaterial, after pointing over the high lights, in what order the successive oxidations are produced, but it is preferable to oxidize the finer and more delicate portions of the design first, and finish with the ground etching. The depth of the etchings is of no consequence, the color, like heauty, being only skin deep.

The varnish which the inventor prefers is made as follows: Asphaltum, two ounces; white wax, 1½ ounces; Burgundy pitch, one ounce; and turpentine. Melt the asphaltum in a glazed saucepan, and add the wax gradually, stirring with a glass rod; add the pitch and continue stirring, permitting it to boil up two or three times, but never let it boil over.

Take the saucepan from the fire and stir in enough turpentine to make it the consistency of tube oil paints. Other colors, such as dark purple and orange, red and green, green hronze and light green, bright green and red, hright pink, iridescent purple, may be made by the same method with various kinds of haths.

Mechanical Progress.

How to Temper a Spring.

Tempering a spring is not the hard job which some smiths, professional as well as amateur, seem to make of it. In getting ready to temper a spring, one should begio with the forging itself, for if that be not well done, no amount of "know-how" can make a success of the tempering. The forging should be done with low heats and light blows, and the steel should not be hammered while cold, with heavy blows at least. Avoid making hammer marks in the steel when forging, for although such marks may be worked out, they do not add to the strength or long life of the spring. A good many failures of seemingly perfect springs could doubtless be traced to this little point in the forging. After the spring has been hammered to size, spend a little extra time in lightly hammering the steel when it is nearly cold—but don't strike hard.

The light hammering will toughen the steel, and make a better spring. The outside surface or "skin" seems better adapted to spring work, where the surface is hammered up, instead of heing filed or ground. After done hammering, polish the spring with a bit of emery paper. It is hest not to put it on an emery wheel, for then the skin above described would be destroyed. Sometimes, however, it is necessary to partly shape the spring by grinding, but if possible let this be done at an early stage of the job, so that the outside skin may be restored as much as possible. When ready for the hardening, there are two ways of doing the heating, either by holding the spring over a clean fire with a small pair of tongs, keeping the spring high up so as to heat slowly, or by first heating a heavy piece of iron red-hot, and then placing the spring on that until the steel is heated.

A modification of the latter method is to heat some lead red-hot in a ladle and plunge the spring in that, but when this is done, the spring should first be heated in the fire until it is at least black-hot, that the sudden shock of meeting the red-hot lead may not cause disastrous strains in the steel. When the spring is fully and uniformly heated to a light red, plunge into cool hut not ice-cold water. The amount of twist that is got into the spring by this operation depends on the manner in which the spring is put into the water. If it be put in so that a flat side touches first, the sudden cooling of that side will cause the spring to he pulled out of shape, and held there by the subsequent cooling of the rest of the spring. If put into the water endwise, or straight, there will he but little distortion of the spring.

After hardening, polish the spring with a bit of emery cloth until the metal is bright, clean and white. Then put a few drops of oil on a bit of paper, light it, and hold under the spring until every portion of its surface is covered with a thick coating of smoke. Next heat the spring slowly, holding it high up over the forge fire, until the smoke is all burned off; but it should all go alike. Don't let one part of the spring get so hot that the smoke is all burned off, while another part is thickly coated. That means a spring with uneven temper, that will break in short order. When the smoke has been carefully burned off, lay the spring on the ashes of the forge to cool slowly, and in a few minutes it will be ready for work.—The Tradesman.

THE ROSE GAS PROCESS.—The Rose fuel gas apparatus now in operation at West Chester, Pa., makes in one hour as much gas as was made formerly in 12 hours, a recent test showing 23,500 cubic feet in an hour's time The two holders now in use have a capacity of 24,000 and 55,000 cuhic feet, but the machinery is only run several hours alternate days as the green gas has to he exhausted from one holder to the other at a rate of ahout 4000 feet per hour, though machinery will shortly he installed to exhaust 14,000 or 15 000 feet per hour. In a separate building is stored about 8000 gallons of crude oil, which is used in the manufacture of the gas at the rate of about 3¾ gallons per 1000 cubic feet of gas. The oil is pumped to a tank on the roof of the building from whence, by gravity, it goes to the furnace and mingles with the coke. But one man is now employed, who does the work formerly done by four or five men. An expert from Philadelphia made a test of the gas a few days ago, and reported that candle power was 30.2 and the specific gravity .600, and the heat units per foot, 698. Only four gallons of crude oil per 1000 feet were used. This gas is being sold for fuel purposes at 75 cents per 1000 feet where the consumer uses more than 5000 feet per month. The cost of it with coal at $2 90 and coke at $3 80 per ton and oil at 2¾ cents per gallon, is 20 cents per 1000 feet delivered in the holder. The Rose process is new in several respects. Steam is decomposed with bituminous coal enriched with crude oil, and the gas is fixed with red-hot coke. The product is not strictly a water-gas, as it only contains about nine per cent of carbonic oxide. It is very rich marsh gas hydrogen, hence its high heating power. One man is managing the West Chester machine and producing gas at the rate of 20,000 feet per hour.—*American Manufacturer.*

MAKING ANTIQUE OAK.—There are one hundred methods for darkening oak, some of them heing fairly good, and some of them being decidedly bad, but one of the best methods, and one that never fails, is the fumigation of oak with ammoniacal vapor. When the work is ready to be darkened, place it in an approximately *air tight* room in which no light enters; for small work a packing-box will answer if the joints or cracks are covered with paper being pasted over them. Place the doors, furniture or other work in this room—a hox—and place in the room a flat porcelain or earth en vessel filled with amm nia. See that the vessel containing the liquid is placed on the ground or floor, so that the fumes or vapor will strike the articles designed to be darkened. If the room or box is large, two or more vessels containing ammonia may be placed on the floor and left there until the wood is sufficiently dark. Of course, all openings in the room or box must be closed up, or the fumes will escape. Remember that the ammonia does not touch the oak, but the gas that comes from it acts in a wondrous manner upon the tannic acid in that wood, and browns it so deeply that a shaving or two may actually be taken off without removing the color. The depth of shade will entirely depend upon the quantity of ammonia used and the time the wood is exposed. Try an odd bit first, experimentally, and then use your own judgment.—Operative Builder.

COMPRESSING COTTON. — The adoption throughout the South of the roller cotton compress, which by a process simple in principle, and using no more power than is required for the plantation bale, will, says the *Manufacturers' Gazette*, it is anticipated, become very general; the capacity of the apparatus heing equal to turning out a bale of less hulk, greater density, and of more even and smooth exterior than the large steam compresses make. The invention is expected to take the place of hoth the plantation press of to-day and the big compresses scattered over the country. Substituted for the ordinary plantation press, it will take the cotton right from the gin and turn out a 500-pound bale as small as, if not smaller, than a bale that has been crushed in the powerful hydraulic presses that are located at the various shipping points; and a bale from the roller compress is ready to put on the cars and be shipped direct to the mill, saving, of course, the charge and expense of unloading and reloading, and doing away with one set of middlemen altogether. The amount of money that is paid out annually for compressing the hales after they have left the country gins is very large, and this, it is claimed, is by this apparatus saved to producers and consumers alike.

FERRULING BOILER TUBES.—An exhaustive test of the new method of ferruling the tubes of leaky boilers, which was made at the direction of the British Admiralty, has had a successful result. The Thunderer was selected as the vessel best suited to conduct the test. She recently returned from an experimental trip to Madeira, having steamed continuously at four-fifths full power during the passage out and at a slightly increased pressure on the homeward journey when meeting head winds The hoilers showed no sign of leaking, and out of a total of 3000 ferrules fitted to the tubes only three were found defective. The *Record* considers that this test settles the question, and estimates that at the present time there are boilers in British Naval vessels, representing a value of over £150,000, that can he made efficient by this plan of ferruling, which would otherwise be condemned. The ferrules are very easily fitted, being simply driven into the ends of the boiler tubes without screwing or o her appliance. The ferrule has an overlapping flange, with an air space, which is claimed to preserve the end of the tube from the action of the fire close to the hoiler plate.

EDWARDS' WORKS ON THE STEAM ENGINE.

The American Marine Engineer. Theoretical and Practical. With Examples of the Latest and Most Approved Marine Practice. For the Use of Marine Engineers and Students. By Emory Edwards, Marine Engineer. Illustrated by 85 engravings. 12mo. 435 pages. Price, $2.50

Edwards' 600 Examination Questions and Answers. For Engineers and Firemen (stationary and Marine) who desire to obtain a U. S. Government or State License. By Emory Edwards. Full bound in pocket book form, leather. 130 pages. Price..... $1.50

The American Steam Engineer. Theoretical and Practical; with Examples of the Latest and Most Approved American Practice in the Design and Construction of Steam Engines and Boilers of Every Description. For the use of Engineers, Machinists, Boiler Makers, and Students. By Emory Edwards, M. E. Illustrated by 77 engravings. 12mo, 419 pages..... $2.50

Modern American Marine Engines, Boilers, and Screw Propellers. Their Design and Construction. Showing the Present Practice of the most Eminent Engineers and Marine Engine Builders in the United States. By Emory Edwards. Illustrated by 30 large and elaborate plates. 4to..... $5.00

The Practical Steam Engineers' Guide in the Design, Construction and Management of American Stationary, Portable, and Steam Fire Engines, Steam Pumps, Boilers, Injectors, Governors, Indicators, Pistons and Rings, Safety Valves and Steam Gauges. For the use of Engineers, Firemen and Steam Users. Illustrated by 119 engravings. 420 pages, 12mo..... $2.50

A Catechism of the Marine Steam Engine. For the use of Engineers, Firemen, and Mechanics. A Practical Work for Practical Men. Illustrated by 83 engravings, including examples of the most modern engines. Fifth edition, thoroughly revised, with much new matter. 12mo, 414 pages..... $2.00

Modern American Locomotive Engines. Their Design, Construction and Management. Illustrated by 74 engravings. 12mo, 383 pages..... $2.00

Engraving. Superior Wood and Metal Engraving, Electrotyping and Stereotyping promptly attended to at this office.

Useful Information.

Insect Illumination.

The secretary of the Smithsonian Institute, Prof. Langley, has been recently experimenting with Cuban fireflies with view to discovering the manner in which the illumination they emit is generated. He says that the light that they give is the cheapest in the world produced, that, is to say, with the least heat and the smallest expenditure of energy—and he believes that a successful imitation of it would prove a most profitable substitute for gas or electricity. The insects are beetles two inches long, and belong to the family of "snapping bugs," so called because when one is laid upon its back it snaps itself into the air with a clicking sound. The secret of the light this firefly gives is as yet undiscovered. Apparently it is conected in some way with the mysterious phenomena of life, and chemists and physicists have sought in vain to explain its origin. On each side of the animal's thorax is a luminous, membranous spot, and these flash at intervals, so that the Cubans put a dozen of the insects in a cage together and so obtain a continuous illumination, bright enough to read by. This light is accompanied by no perceptible heat, and is seemingly produced with almost no expenditure of energy. How great an improvement it represents upon all known artificial lights can be imagined when it is stated that in candle light, lamp light or gas light, the waste is more than 99 per cent. In other words, if they could he so obtained as not to throw anything away, they would give nearly one hundred times the illumination they do afford. Even the electric light is mostly waste.

COAL MEASURES.—The coal deposits that are tributary to Castle, Mont., are awakening the interest here that their value will soon command. Of late, a large number of locations has been made. It is said by those who are familiar with the surface showings here that they are superior to those seen by them in other coal districts in the State. The measures here lie to the south of the town, and to the northeast and southeast of this place. Fifteen miles in a northeasterly direction from here are some good veins, over a foot in width outcrop. From there the coal indications are traced to within 2½ to 3 miles of Castle. Near the town, veins from 4 to 6 feet wide have been exposed within a few feet of the surface. From there south for 17 miles there are abundant external evidences that large measures of coal underlie the country. On Sixteen-Mile creek, which derives its name on account of its distance from Castle, the deepest workings exist. There a 12-foot seam within 100 feet of the surface has been uncovered. The grade of coal of this district is supposed to belong to the Laramie period of the Cretaceous age, which for quality is considered the second best among the coals found in this intermountain country. With such abundant natural resources as this place possesses, it is not unnatural to suppose that a railroad from either the places that covet one to Castle would he a paying proposition from the start.—Castle Trihune.

GRAPHITE AND GRAPHITITE.—Graphite plays an important part in the manufacture of arc-light carbons, and has in the process to be first of all finely powdered. According to some researches of W. Luzi (*Deutsch. Chem. Gesellschaft*, Vol. XXIV,) certain kinds of graphite, which he proposes to call *graphitite*, may be very easily reduced to powder by chemical means. It has been known for some time that graphite boiled in certain reagents, and then washed and dried, swelled in a most extraordinary fashion when baked. These reagents were concentrated sulphuric acid and a mixture of concentrated sulphuric and nitric acid. W. Luzi finds that fuming nitric acid is also a reagent. The graphite which exhibits this peculiarity of swelling comes from the following sources: Ticonderoga, Pfafferreuth, Ceylon, Buckingham (Canada), Argenteuil (Canada), Massachusetts, Amity (N. Y.), Greenville (Ont.). The so-called graphitite comes from Passa (Siberia), New Mexico, Burkhardtswald (Saxony), Idar, Fichuelgebirge, Diedelkopf (Tyrol), Levigliani (Italy).

PREVENTING DUST IN MINES.—In some of the German mines a new method has been successfully introduced for preventing coal-dust explosions, in place of the usual practice of sprinkling water in dusty parts of the mine, this plan having only a limited utility, as the dust is generated by the breakdown of the coal, and explosions may arise from the liberation of gases at the same instant. To meet these circumstances, the use of water has had an entirely new application, and with a result remarkably satisfactory. Holes of one meter depth are drilled at a distance from each other of about three meters, wooden plugs are inserted, and through them iron pipes from three quarters to one meter long, with openings between 2½ to 3 millimeters large, and connected with rubber hose. It appears that in the Camphausen colliery a pressure of from eight to ten atmospheres and injection through two tuhes in eight hours proved sufficient to impregnate 6x1x1½ meters, and in another case, that of the Kreuzgraben colliery, the water forced in under a pressure of 20 atmospheres during 16 hours moistened thoroughly the coal as far as as four meters above the highest hole. In carrying out this method, primary regard is to be paid to the water pressure ohtainable, the quantity of the water injected, and the firmness of the seam, the latter depending somewhat on the size of the coal-pillars in the workings.

COAL CUTTING BY MACHINERY.—The undercutting of coal by machinery is now claimed to he greatly facilitated by means of a newly designed arc apparatus, involving, it is asserted, a decided improvement on the usual principle of construction in vogue. A heavy iron base, cast in one piece, serves as a foundation for all the parts, carrying two pairs of axles, one at right angles with the other; the gauge of one pair is fixed to suit the regular track gauge of the mine in in which the cutter is to work, and these axles carry small-flanged wheels upon which the cutter is easily moved about the mine, and in and out, according to requirement. The second pair of axles carry small wheels for supporting the cutter when in actual operation and carrying it along the face of the wall being cut; they are not flanged, but kept on the track by two pairs of single and two pairs of double guides, and the support of the machine is easily changed from one pair of axles to the other by means of a cam worked by screws, the larger-flanged wheels being raised out of the way when the cutter is moving. The motor power is furnished by a 15 h. p. motor, which is perfectly watertight and thoroughly protected from all danger of mechanical injury. The armature shaft carries a bevelled gear, thus giving the shaft on the right a right-handed or left-handed rotation, and, by an ingenious arrangement, this shaft operates the feed chain at practically any desired speed.

SAFETY VALVES.—You may do all the figuring you want to about safety valves, but if the one you have has not capacity enough to discharge all the steam that the boiler can make with the fiercest fire that you can build under it, and with all the other escapes closed, it is not a safety valve; it is worse than nothing, because it will give you a false confidence. Try it some day with a moderate fire, and if you find that the pressure on the gage rises above that at which the valve should blow off, you may be sure that in time of real danger, when there is no one by to control the fire, the valve will fail to do what it is intended to do. Better not rely upon one valve only; best to have two, with one opening in the shell, but each having its distinct case and discharge. Safety valves don't cost nearly so much as blow-ups and funerals. A safety valve of too limited capacity is like a dummy lightning rod, worse than nothing at all. The practical test, better than mere figuring out what it will discharge, is to try its discharging capacity as against the boiler's generating powers with a moderate fire, as I have said. If it fails in this, double up.—Ex.

SHARPENING BY ACIDS.—It has long been known, says a contemporary, that instruments and tools, such as knives, shears, scythes and files, which have become blunt hy use, may again have a keen edge imparted to them hy means of acids, as well as by the common methods of sharpening and whetting. But, so far, the less usual process does not appear to have met with the favor which its merits deserve. All dilute mineral acids are adapted for tool-sharpening. For example, 10 parts of sulphuric acid hydrate to 100 parts of water. The desired end is more quickly attained if a portion of the sulphuric acid be replaced by nitric acid. A suitable mix ure is, 1 litre of water, 50 grammes of Chile saltpeter and 60 cubic centimeters of concentrated sulphuric acid. This compound dissolves 1½ grammes of metal within ten minutes from an iron surface of one square centimeter. Dissolution is slower where su phuric acid alone is used. Steel is acted upon in the same manner as iron, with the exception that the process is not so rapid because of the polished surface becoming covered with a thin deposit of separated carbon. It has been sought to strengthen the action of the acids, or, in other words, to shorten their period of action, by attracting the electrical resistance of the iron with gas retort coal or with other metals; but up to the present no substantial advantage has accrued from this method. In order to secure as uniform an acid action as possible, preliminary cleaning of the metallic surfaces, preferably wirh a soda solution, is recommended.

THE BEST DEPOSITS OF TIN.—The mineral resources of the Indian or Malay Archipelago are known to be very great, but up to the present systematic mining operations have been confined to the wonderfully rich and pure stanniferous deposits of the islands of Banca and Billiton. The tin obtained from the ores fonnd in this part of the globe is the most unsophistical produced. A recent analysis of Banca metal gave the following results: Tin, 99 961 per cent; iron, 00.019; lead, 00.014; copper, 00 006; total, 100. According to the latest statistics available, there are in the island of Banca some 200 mines worked by private companies, while abou' one-half that number is exploited by .ne Dutch Government. The island itself is divided into nine mining districts. The miners are members of the Kongsis or Chinese tr. des-unions, which effect the labor contracts with the Government. The cost of production in the last fiscal period amounted to 26.14 Dutch florins per picul, a weight of approximately 135 pounds. The sale price attained an average price of 83.82 Dutch florins, so that hy a total output of 65,964 piculs a net profit of 2,805 000 gulden, or £233,750, accrued to the Government of the Netherlands. The mines on the island of Billiton are in the possession of a private concern. This organization pays a royalty to the Government of 3 per cent of the gross annual yield. In the preceding financial year the authorities received under this agreemeet 2376 piculs, out of a total of 76,183 piculs, a quantity which realized on sale about £17,000. The mining board which controls the government works is an offshot of the Dutch ministry of commerce, and it consists of 15 engineers and 24 overseers.

BURNING LIME WITH OIL FUEL.—A Maine concern has been experimenting for some time on a process of burning lime with oil instead of wood. The oil for use at the Warren kilns is stored in a huge tank holding 10,500 gallons, from which it is pumped into a pressure-tank of 150 gallons capacity, and a 20-pound pressure is applied. The oil is purified by passing it through water, and a meter is attached to the kiln. Each kiln has two arches, and two pipes run to each arch. One pipe carries the oil, the other, steam to force the burning oil up among the limerock. The heat produced is intense, making it necessary to draw eight times a day. The lime produced by the oil process is whiter than that burned with wood, and is claimed to be of better quality.

THE following directions for joining band saws are given by the Defiance Machine Works: Bevel each end of the saw the length of two teeth. Make a good joint. Fasten the saw in brazing clamps with the back against the shoulder, and wet the joints with solder water, or with a creamy mixture made by rubbing a lump of borax in a teaspoonful of water on a slate. Put in the joint a piece of silver solder the full size thereof, and clamp with tongs heated to a light red (not white) heat. As soon as the solder fuses, blacken the tongs with water, and take them off. Remove the saw, hammer it if necessary, file down to an even thickness, finishing by draw-filing lengthwise.

IN a lecture on fire prevention, Prof. Goodman again called attention to the value of wooden joists for building purposes, as compared with iron and steel. He explained that the two latter materials lose their strength at a not very high temperature, whereas wood will sustain a heavy strain for a much longer period when exposed to great heat.

THE various colors of flame in a wood fire are caused by the combustion of the elements of the fuel. The light hlue is from the hydrogen, the white from carbon, the violet from manganese, the red from magnesia and the yellow from soda.

ASAFŒTIDA is not, as many suppose, an animal product. It is prepared from the roots and stems of a plant grown extensively in Persia, Beloochistan and India. In the last named country, cooks use it in all kinds of pudding.

IT has been found that by the use of the sand-blast the lettering on tombstones can be done at greatly reduced cost, with no sacrifice of beauty in the result.

Metallurgy and Ores.

SELBY
SMELTING and LEAD CO.,
416 Montgomery St., San Francisco
GOLD AND SILVER REFINERY

Electricity.

Electric Power Cables and Gas Pipes.

A German contemporary contains a full account, with plans and drawings, of two cases of injury to gas pipes recently caused in Berlin by electric cables. In one of these cases, a cable-bnx, into which 12 cables passed, exploded with a flame, and it was observed immediately after that all the gas flames down one side of the street had gone out, and these could not be lighted again. There was no escape of gas after the explosion. The wires were in close proximity to a gas pipe of 4.2 inches diameter. The leather washer of the nearest street-lamp connection was burned; the next two were looseoed; the next was completely destroyed. Then a bit of the gas pipe was destroyed, along with the lead of the coupling at a joint, and the melted mixture of iron and lead had been driven up a 22 inch pipe, which was itself destroyed and perforated in a most extraordinary way. The electricians were three days repairing the damage to their various cables in the neighborhood. The telephone wires in the vicinity were also interfered with, and a new telegraph wire had to be laid, 50 yards of it having been burned. There appears to be no doubt that the insulation of the electric cable had given way, and that the current had forced itself from the outer coating across to the near gas pipe.

In the second case, a fortnight later, a Siemens street lamp burst into a huge flame, showing that a pipe had suddenly burst inside the pillar. The pneumatic-post system was also deranged, the tube being blocked, and gas steamed through the tube into the postoffice. A cable crossing the pneumatic postal-tube was destroyed for about two feet of its length; the pneumatic tube had its joints melted up and became blocked, and the current had run off to the street lamp and melted two holes in its iron-supply and nearly melted a third, and had damaged the service pipe and the main; and had, besides, run off to other electric cables and burned them up. After it was thought that all damages were repaired, the smell of escaping gas remained exceedingly strong, and then it was found that the current had also burned a hole in the 10.4-inch pipes of the English Gas Company, this hole being four inches in diameter, and the pipe being separated from the cable by a space of 0.8 inch, packed with earth. One curious feature was the burning of a hole in an iron pipe on the side remote from the electric cable.—Invention.

APPARATUS FOR TWISTING METALS.—An outcome of the increasing use of electrical heating is the electrical metal-twisting machine. This is used in the production of twisted metal bars, which are largely utilized for stair rods, fence pickets, office partitions, elevators and other ornamental work. It is found that where the electric current is employed for heating bar-shaped blanks, the metal heats from the interior instead of from the exterior, as in the ordinary blacksmith's forge; also that there are 00 gases introduced into the metal when it is electrically heated, and coosequently when the blank is twisted no scale is formed, and the metal is left clear and free from blemishes. Another point which, under the conditions, is a great advantage, is that the bars retain the electrically produced heat longer than that of the ordinary surface-heating forge. The metal bar to be twisted is held securely in place by a clamp at each end and a central clamp. The current is then switched on, and in a few seconds that portion of the metal rod which spans the space between the clamps is heated to a forging temperature, while the parts which are directly in contact with the end clamps remain cool. As soon as the current is switched off, the central clamp is released from the bar. A crank at the side of the machine is then turned, the end of the bar being still held in this clamp, and the rotation of this shaft causes the rotation of the bar. The degree of twisting, which is effected in an instant, can be accurately regulated.

STORAGE SYSTEM.—Pedro G. Salom is an earnest champion of the storage battery system of street railway propulsion. In a lecture delivered before the Franklin Institute in June, Mr. Salom, who is widely known in the iron trade, accounts for the delay in introducing storage batteries by the intense patent litigation on the subject during the last five years. He cites a record at the Citizens' Passenger Railway in Indianapolis, showing that a single set of 108 accumulators made over 6000 car miles. On the basis of this achievement, he places the cost at 3 85 cents per car mile. He urges that there are no insurmountable difficulties connected with the storage system beyond the fact that it costs a few cents more per car mile than the trolley, and holds that the demand for its introduction will be irresistible when the disadvantages to the public of the trolley are taken into account.—Iron Age.

THE "STUDY" OF ELECTRICITY.—The rapid growth of the industrial applications of electricity has placed the study of electrotechnichs on a footing with the older branches of engineering, if, indeed, it has not already outstripped them. Statistics show that the number of students who choose the electrical studies at our larger universities and technical schools is yearly increasing. At Cornell University, for instance, the number has increased from 28 in 1884 to 250 in 1892; and this is only a specimen of the continued growth in other institutions. Evidence is not wanting that the coming year will be no less a prosperous one in this respect for the universities than preceding ones. We receive almost daily, communications from men of all ages and engaged in a great variety of occupations, asking for advice and direction in the choice of a method of securing an electrical education, or for assistance in the selection of an institution at which the study of electrical engineering may be pursued to the greatest advantage. Of course this is a question to which a definite answer can only be given for each individual case, as the circumstances of the student, the means at his command, his age, his previous training, either in the school or the shop, must be considered. There is undoubtedly a tendency among the younger men who have been trained in the shop to take a partial or complete course in electrical engineering at some reputable university whenever circumstances will permit of it.—Electrical World.

RUSSIA has long been the source of supply of platinum for electrical purposes, large quantities of it being required in the manufacture of incandescent lamps, which would be much cheaper if an efficient substitute for it could be found. Canadian platinum has now made its way into the market and the product promises to be large in time, says an exchange. It comes from British Columbia and is met with in association with alluvial gold. The Tulamen district yields it in grains and nuggets. One firm in the United States is reported to have bought 2000 ounces within the last year or two, and another portion of the yield has been marketed in England. Time was, and not long ago, when incandescent lamp manufacturers were giving high prices for the butts of old lamps, so that they might recover the platinum stems used to connect the carbon filaments with the outside circuits.

THE ELECTRIC CURRENT IN THE DETECTION OF TORPEDOES.—The electric current which is used for the propulsion of torpedoes is now used for their detection, as well as for that of mines in harbors and channels. The apparatus employed is very simple and can be easily carried in a small boat. It comprises a metal sinker and a telephone, with batteries and induction coils. The sinker, which is attached to a small cable, is dragged along the bottom of the harbor where the presence of torpedoes is suspected. The operator in the boat or launch places the telephone to his ear and listens attentively. As soon as the sinker approaches a metallic body, such as a torpedo, a buzzing noise is heard; and this noise increases as the distance between the sinker and the torpedo is lessened, and becomes loudest when the two metals come into contact.

NO STRONGER evidence of the safety of electric-lighting installations can be afforded than by the fact that many gunpowder factories are now being lighted by electricity. It is obvious that in a building wherein the preparation of inflammable or highly explosive substances is carried on, very special care should be taken in order to avoid even the smallest risk, and powder manufacturers now find that the electric light adds a considerable percentage over gas to the chances of safe operation.

ELECTRICAL MACHINES are employed in England for removing miners' wedges, tools and picks out of coal before grinding for coke making. The material is passed through a revolving cylinder fitted with many pole pieces, which, being magnetized, attract all the pieces of iron and steel to them, and hold them fast until the current is taken off.

IT has been found that incandescent lamps, especially those with long filaments, are shorter lived when mounted in a horizontal position or in a position upwardly inclined from the horizontal.

Educational.

MINING AND SCIENTIFIC PRESS.
The Leading Mining Journal in America. Established 1860. Latest Discoveries in Science and Improvements in Mining and Mechanic Arts illustrated or described. A Standard Illustrated Weekly published at $3 a year by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION — JUST OUT.
Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

Testing and Working Silver Ores

A VALUABLE BOOK

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnaces, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Kroehnke's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Keodall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, $2.00. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, $8.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

BY J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from ormulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

California Inventors Should consult DEWEY & CO. AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. FRUE ORE CONCENTRATOR

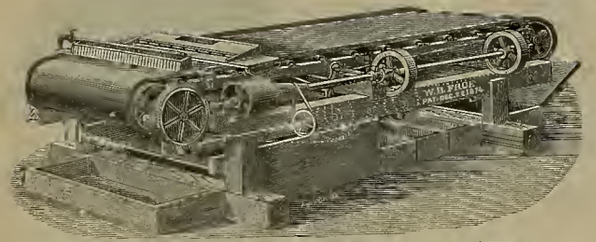
OVER 3200 IN ACTUAL USE.



Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Cal veras Co., Cal., Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.

No. 132 Market Street, - - San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

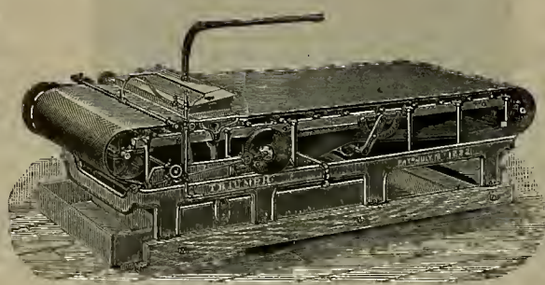
The competitive trials which have been held between the Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Trinmph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,

Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

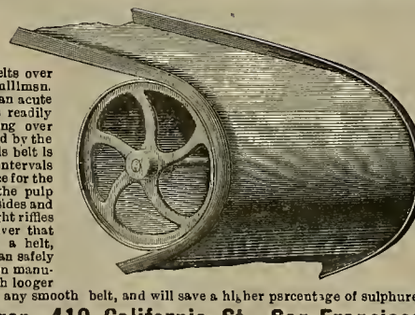
—BUILT SOLELY BY THE —

BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,
BUCYRUS, OHIO, U. S. A.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets



H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador *Ledger*, Sept. 3: All preparations for sinking in the Wildman mine have been abandoned. They have concluded to further explore the levels already opened up, and in all probability sinking will not be undertaken until late in the fall, as by that time not only will the mine be more extensively developed, but the air, in consequence of cold water, will be much better, which will be a material advantage to the miners. Exploring in the South Eureka is forging along, but the development of good pay rock is yet to come. The rock encountered so far is not of a milling character, though the ledge is of good size. They are still crosscutting west and have reached a distance of 200 feet. The ground continues to get softer, which is a good indication, and they hope when the ledge is found that it will be gold-bearing. Drifting on the ledge will be continued for some time yet. Everything is moving along slowly but surely at the Hector. All preparations are about completed for the starting of the mill. Rock is to be run into the dumps right away; the big bin between the mine and mill is now finished. It has chutes which conduct the ore into the cars and it is then run to the mill, a distance of 150 feet. At the Belmont they have crosscut 20 feet west at the 200-foot level, and have struck a fair-sized ledge and the rock prospects fairly well, and no doubt will pay. Mr. Tibbitt's ambition is to go deeper, when he feels very confident of opening up one of the best paying mines of the county. Charles Smith has two or three men running surface dirt into the Lincoln mill, and he expects to make good wages.

HECTOR. — Amador *Record*, Sept. 1: Some pretty extensive work is being done at the Hector mine and the improvements under headway are of a character that show that the property is in be put in shape for extensive and permanent working. The new ore bin midway between the hoisting works and mill is about completed, and the air-compressor being placed below the mill will soon be in readiness. Air pipe is to be put in to the 700 level and the water is kept down to that depth. A station is being built on the 600 level, which level will furnish ore for the mill at present. It is expected to start up the 40-stamp mill between now and the 15th, and there is sufficient ore opened up to keep it running right along. The operation of this mine on the scale proposed will add considerably to the business interests of this section. The steady running of a 40-stamp mill necessarily means the employment of a goodly crew of men.

Butte.

GOOD PROSPECTS.—Oroville *Register*, Sept. 1: Supt. F. J. Houghton of the Rainbow mine was in Oroville yesterday and, in response to questions, said that the outlook for the Rainbow was bright. They began at the 100-foot level with a ledge 16 inches wide and are now down 200 feet and the ledge has constantly increased in size. The mill has been running a month and the receipts are satisfactory. The mining outlook at Hurleton is getting better every day. There are many good ledges that will pay well to work and the main object is to attract capital so as to develop them.

VERY RICH QUARTZ.—W. W. McMillan was in town on Monday and showed us some extremely rich quartz taken from a shaft 26 feet deep on the Phœnix Extension near Hurleton. The mine is bonded to Col. A. P. Frary, and if the ore in it looks like the quartz McMillan showed us it is worth a fortune. Some of the pieces were apparently half gold and all the specimens were very rich. He estimates such quartz would be worth $10,000 a ton. The main ledge is about two feet wide, but this is a stringer coming in from one side. The shaft on the Phœnix is down 95 feet and the ledge is four feet in width. Col. Frary is in San Francisco and it is thought arrangements will at once be made for putting on machinery so as to more fully develop the lode which is exceedingly promising.

Calaveras.

MURPHYS MINES.—San Andreas *Citizen*, Sept. 3: Advices from the Washington mine, managed by Colin Campbell, at Indian Creek, are to the effect that two men have been steadily employed for some time past. A larger force will be put on in the near future, as a good vein of ore of average width has been discovered in the old and original tunnel. It is not the disposition of the energetic gentleman at the helm of this enterprise to abandon operations upon short notice. As far as practicable the work has been continued and the outlook now is that more chutes are opening up for inspection. This is to be hoped for, as there is a good mill upon the mine and everything in perfect readiness for operations upon short notice. Everything in and around the Beatrice mine, near town, is being pushed with astonishing vim. It is apparent that it will not be long before matters will assume an enterprising aspect that has seldom been equaled in the vicinity. The mill grade is fast nearing completion. Work is going on with a systematic vim. A boarding-house and also a lodging-house has just been built near the mine. Supt. Hardy went to the city several days ago and is expected back tonight, 29th inst.

Plumas.

IRON-ORE DEPOSITS.—*National Bulletin*, Sept. 1: We are in receipt of a sample of iron ore from the Sierra iron mine, which is located on the line between Plumas and Sierra counties, south of the Plumas Eureka mine. It was presented by S. S. Taylor, who is collecting for the World's Fair exhibit. In this mine is a vast deposit of magnetic iron ore which, when the railroad through Plumas is completed, will become of great value.

San Diego.

PERRIS VALLEY MINES.—Perris *New Era*, Sept. 1: The Good Hope mine is without doubt one of the best gold mines in California, but who, outside of a few, has ever heard of it? It has been running along silently for years, giving up its glittering metal and enriching its owners. About half a mile northwest from the Good Hope, and four and a half miles from Perris, lies the property recently purchased by the Gold Prince M. Co., of which H. A. Thompson of New York is president; R. H. Falkenburg (Captain Dick) is general manager, and Robert L. Binford, secretary. The property lies on patented land formerly owned by Mr. Woodward, and embraces 60 acres. It is well-wooded and watered and easy of approach, and being in close proximity to the Southern California railroad, every facility is afforded for cheap and successful development. The ledge is evidently a continuation of the Good Hope and is tapped by three shafts, in each of which the vein has been uncovered. The ore in the ledges is of a white quartz, strongly marked with iron, and carries both free gold and sulphurets. Assays of the ore have varied, ranging in value from two or three dollars to the hundreds, but a fair and conservative estimate would place the average at not less than $20 per ton. Since the Gold Prince Co. has taken the management of the mine, now only a month, a large amount of tunneling, sinking and timbering has been done, besides the constructing of offices, men's sleeping-house, mess-house and sheds, and a temporary hoisting works. The latter is run by a 40-horsepower boiler and is capable of raising 20 or 35 tons of ore per day. At present about 15 men are employed about the works, under the foremanship of Walter Murray, an experienced Comstock miner, but this force will be increased as soon as room is made in the mine for more men. It is the intention of the company to thoroughly prospect the mine, and with that end in view the shafts will be pushed to a depth of 200 feet at least, before millwork will begin. This they expect to accomplish in about two months, at which time a Bryan or Crawford rollermill will be put in position. These mills comprise the latest improvements in mining machinery and are capable of crushing 25 tons of rock in a 12-hour run. Another improvement will be the addition of an electric plant, by which all the inner and outer works will be lighted. The Gold Prince Co. has gone to work in earnest to develop and make a paying mine of the property, and in their efforts to accomplish this they cannot but have the best wishes of the people of this valley. Captain Crossman started work yesterday on the Rosalia mine, in the Gavilan district. In this work he has interested Riverside capital and he will thoroughly develop the property. The Virginia mine, six miles west of Perris, has been sold by Perry Shay to a syndicate represented by Captain Strong, who will commence immediately the work of developing it.

Shasta.

IGO SILVER DISTRICT.—Redding *Free Press*, Sept. 3: The owner of the Richmond mine, John P. Wright, has been taking out some rich ore averaging 100 ounces per ton; his shipping ore yields 300 ounces per ton. There are two shafts on the ledge, each 50 feet deep, with a tunnel 65 feet long between the two. The vein runs a little east of north and the dip is almost perpendicular. On this hill some good claims are being worked. It is bounded on the north and east by the South Fork of Clear creek, and on the south and west by Andrews' creek. The Chicago mine is on the north side and extends across the summit. At present nothing is being done on this property, but on the adjoining claim, which is an extension, William Gillon has drifted to the west on the ledge and sunk a shaft that is now ten feet deep. The ledge shows an increasing width and has a strip along the footwall that carries rich ochre ore, some of which contains a large percentage of gold. The ledge matter carries about 100 ounces silver to the ton. South of Mr. Wright is the Pilchuck mine. Mr. Lewis is working steadily and his mine is turning out some rich ore. A shaft has been sunk and a tunnel has been run to crosscut the ledge. Near by is another claim owned by Mr. Lewis. His partner, Mr. Eubanks, a captain in the Salvation Army, is hard at work running a tunnel to crosscut the vein, with every prospect of opening up a good property. The Crystal mine is also working steadily. It is on this side of the hill that reduction works should have been erected, and no better enterprise could be undertaken in the county than the putting up of a good working plant on Andrews' creek. The Yount Co.'s works on the other side of the hill have somehow come to a standstill. It is not for want of ores to handle that the works have not been completed. These half-hearted enterprises do an injury to the district and to the county. A disagreement about the method of working some of the ores seems to be one of the difficulties, but, whatever they may be, it is time that things were settled and the plant put in running order. On the South Fork side W. D. Bull is putting in some good work on the Lodi mine. This mine is on an adjoining section to the Wright group. Mr. Bull has sunk a shaft 40 feet and is drifting along the ledge, which shows strong and keeps its width. Selby's returns average $250 in silver and $27.67 in gold to the ton. There is about 12 per cent lead in this ore. Mr. Streator and others have good claims on this section and there must be a very rich one somewhere close by, as there are indications of a contact—slate and porphyry, slate and granite—in this neighborhood. So far all the veins have been found in a granite formation, with well-defined walls and a clean and sometimes very wide gouge. This district offers excellent opportunities to prospectors and investors.

CYANIDE BULLION.—At the Bank of Shasta County can be seen a small bar of bullion from the Shasta mill, working the MacArthur-Forrest cyanide process. The bullion is as bright as a $20 gold piece, and one can hardly realize that so heavy a substance has been in solution. The process is working highly satisfactory.

NOTES.—The Calumet Co. is now working three mines on Flat creek. Only a small part of the Calumet works is now running, on account of slackness of water. The Calumet Co. is going to put an ore cable across the Sacramento river for delivering ore to their mill on the east side. There are four or five persons with rockers washing out gold at the bend of the river below Ben Oliver's old fishery, a quarter of a mile from town. They wade into the river, scoop up the rich sand and wash it in their rockers, making as high as $2.50 and $3 a day. This place has been worked off and on successfully ever since and even before Redding was a city.

Sierra.

NEAR GRAVEL.—*Mt. Messenger*, Sept. 3: At latest advices, this week, from the Maple Grove drift mine, Alleghany, the tunnel was within 18 feet of the pay gravel, found in the shaft months ago, which prospected $10 to the carload. Eighteen feet were made with the tunnel last week.

Siskiyou.

TO START.—Yreka *Journal*, Sept. 1: The Ballarat Co. intends starting up work again on its claim at Spring gulch, north of Yreka, having secured more capital to sink down to bedrock, it being necessary to keep a steam pump in constant operation on account of the great amount of water to contend with. On reaching bedrock, good prospects are found. A larger pump can be used to keep the water out, or it may be deemed advisable to run a bedrock tunnel to keep the claim drained continually. The McConnell & Quinn river claim on the Klamath, at mouth of Humbug, has been paying handsomely this season, and considerable dust has been realized. The superintendent, A. Smith, has managed to strike the old channel again, which has always proven rich. The R. H. Campbell Gold Mining Co. at Quartz valley continues to find very rich prospects, most of the gravel at bottom of the shafts on bedrock yielding as high as $10 to the pan, which means a vast amount of gold when the top is sluiced off in shallow places and drifted under its deepest points. The Spencer quartz mine on Humbug has been paying handsomely of late, notwithstanding reports to the contrary. Over 600 ounces have been realized in the last four cleanups, the last one for 11 days run of the five-stamp mill being 160 ounces. Other quartz mines on the creek have also been turning out very well this summer, and the indications show that Humbug is one of the best quartz-mining camps in Siskiyou.

NEVADA.

Washoe District.

CONS. CAL. & VIRGINIA.—*Chronicle*, Sept. 3: There has been extracted from all parts of the mine during the week 996 480-2000 tons of ore, which was shipped to the Morgan mill, the average value of which, per car samples, was $26.77 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $23.69 per ton per battery samples. Bullion now on hand in our assay office, assay value, about $24,800.

OPHIR.—1465 level: From the south drift, 101 feet below the sill floor of the 1465 level, at a point 42 feet in from its mouth, the west crosscut No. 2 has been advanced 17 feet; total length, 52 feet; in porphyry with little quartz.

UNION CON.—900 level: The joint Union Con. and Sierra Nevada west drift has been extended during the week 25 feet.

UTAH.—340 level: From the end of the north drift (at a point 432 feet in) from the west crosscut from the shaft station, west crosscut No. 2 has been extended 23 feet; total length, 243 feet, continuing in porphyry and clay, showing some quartz.

SIERRA NEVADA.—On Cedar Hill, in what is known as the Steel drift, have been following a streak of quartz 4 to 6 feet wide which yields assays of from $15 to $40 in gold.

ANDES.—On 420 level, east crosscut No. 1, north, has been advanced during the week 15 feet; total length, 103 feet; formation porphyry.

GOULD & CURRY.—During the week we have extracted from the old stopes on the 200 and 400 levels 43 cars of ore; average car sample, $18.66 per ton. Sent to the Occidental mill 119 tons; crushed 105 tons; battery assay, $17.70.

BAST & BELCHER.—900 level: During the past week the north drift from east crosscut No. 1, 100 feet from switch, has been advanced 18 feet through soft porphyry, clay and stringers of quartz; total length, 120 feet.

HALE & NORCROSS.—1800 level—During the week advanced the north drift 20 feet; total length, 160 feet. During its progress some low-grade quartz has shown on the west side of this drift and it has cut some small bunches of good ore. Present formation in the face, porphyry. The south drift on this level was advanced 25 feet; total length, 145 feet; face of the drift in porphyry.

CHOLLAR.—Are repairing north drift, 750 level, and west drift, 550 level. East crosscut, 160 feet south of north line, 930 level, is in 38 feet; face in porphyry.

POTOSI.—The northwest drift from the 1800 station, Ward shaft, is out 790 feet; face in hard porphyry. Extracted and sent to the mill the last week, 224 800-2000 tons of ore from the 550, 930, 1100, 1150 and 1300 levels. Milled during the week, 257 tons. On hand at mill, 80 100-2000 tons; average battery assays, $24.83; average car sample assays, $24.79.

BULLION.—The upraise from the east crosscut, 320 feet south of north line, 1300 level, is up 37 feet; top in quartz. The northwest drift from the 1800 station of Ward shaft is in 790 feet; face in hard porphyry. The Potosi winze is down 486 feet below the 1500 level; bottom in quartz and porphyry.

WARD CONSOLIDATION SHAFT.—The joint Alpha and Exchequer south drift from the north line of Exchequer, 1800 level of Ward shaft, has a total length of 445 feet; face in hard porphyry. The joint Bullion and Potosi northwest drift from the 1800 station is out 790 feet; face in hard porphyry. Have started a joint west crosscut on south crosscut on south line of Exchequer.

ALPHA.—The joint Exchequer and Alpha south drift from north line of Exchequer, 1800 level of Ward shaft, has a total length of 445 feet; face in porphyry. Have started joint west crosscut on south line of Exchequer.

OCCIDENTAL.—From the stopes on 350, 400 and 450 levels have extracted and milled 175 tons of ore of the average assay value of $19.80 per ton as per battery samples. Have extended the main north drift, 750 level, 8 feet; total distance from winze station, 464 feet. The face of the drift is in low-grade quartz. The Zadig drift, Sutro tunnel level, has been advanced 20 feet; face in west country rock; total length of main drift, 614 feet; total length of cross drift, 211 feet.

EXCHEQUER.—The joint Exchequer and Alpha south drift from north line of the Exchequer, 1800 level of Ward shaft, has a total length of 445 feet; face in porphyry.

CON. NEW YORK.—The north drift from No. 3 crosscut, 650 level, is out 10 feet; face in quartz, west side showing fair-grade ore. Have started north and south drifts in the winze 50 feet below the 650 level; both show good ore. Car samples average $30 to $40.

SILVER HILL.—Are grading the northwest drift, 260 level.

El Dorado Canyon District.

NEW PLACERS.—Dayton *Times*, Sept. 1: For the past few weeks the new placer locations at the head of El Dorado canyon, about 20 miles from Dayton, have been the subject of a great deal of talk. Raycraft Bros. of Carson are the pioneers of the new mining region, and therefore have the best locations. The canyon is now located for a distance of five miles. The great difficulty to overcome is the want of water. All the lakes and springs in the neighborhood have been located, and ditches are now being dug to carry water to the claims. The ditch will be three or four miles long. With plenty of water, it is expected that $100 a day to the man can be made. As it is, those at work make wages. As high as $1 a pan is frequently taken out. The gold is coarse. One nugget has been taken out that was worth $20 and another one worth $12. The mines can be worked only about six months in the year, and the snow makes all operations in the winter impossible. The placer ground is all the way from five to six feet deep to bedrock and pays all the way.

Kennedy District.

A PROMISING CAMP.—Cor. Austin *Advocate*, Sept. 1: The Imperial lode, no doubt, is the best in the State. It will average three feet in width and can be traced 6000 feet. The Imperial mine on this lode is a good one. The ore will average $40 in gold and from 20 to 40 ounces in silver. It is owned by Kennedy, Benton & Co. There is a tunnel run on the ledge 150 feet, in good ore all the way. There are about 250 tons of ore on the dump. Next north on the lode are the Kersarge and Wiggin mines, owned by Stone & Wiggin. They have run a cross tunnel 100 feet and struck a three-foot ledge of ore. They have about 50 tons of good milling ore on the dump. South of the Imperial is the Chipmunk mine, owned by Joseph Miller. There is a tunnel 80 feet on the ledge which shows good ore. West of the Imperial are the Alta and Alice mines, which show very rich ore. There is not much work done on them yet, but there is some very high-grade ore on the surface. These mines are also owned by Stone & Wiggin. Southwest of those mines is a very promising mine owned by Mrs. Huntsman, of Battle Mountain, and Mr. Hurley. Kyle & Hillyer have a good mine. Jake Leick has a good prospect, the Cricket, east of the Imperial about one-quarter mile. There is a tunnel in on the ledge 100 feet, in good milling ore all the way. North of the Cricket is a mine owned by Dan Keeler and M. Towle. There is a 70-feet tunnel on the ledge, showing good ore. South of the Cricket is a big prospect of very good ore owned by Bent. Larsen, Northway and Lamberson have some good prospects. There are several other very fine prospects in the district, and it offers the best chance for capital to invest that I ever saw in the State. We need a mill to reduce our ore, but we are all too poor to build one. As soon as capital takes hold of some of these mines, this will be the best camp in the State. There is gold enough in any of the ore to pay well for milling; besides, one-half of the value of the ore is silver. Kennedy & Benton are running an 18-feet arrastre and taking out lots of the yellow dust. If men that are mining men and have money will come and take a look at and sample our mines, we shall have a lively camp in a few months.

Tuscarora District.

NAVAJO.—*Times-Review*, Sept. 3: The stopes above the 350-foot level are yielding as usual. The pump has been moved to the 350-foot level.

BELLA ISLE.—South drift, 250-foot level, extended six feet; the vein is looking better. Upraise from the gangway drift, same level, extended three feet; rock very hard and the ore lower grade than at last report.

NORTH BELLE ISLE.—A drift has been started

north on the ore cnt in the line crosscnt, 300-foot level; the pay streak is smsll bnt high grade, progress four feet. The upraise from the south 500 stopes has been extended 15 feet and connected with the 400-foot level, and these stopes will now be worked from the 400 foot level.

NEVADA QUEEN.—Face of east line drift advanced ten feet; stopes show about the same at this point as last reported. Winze stopes continue the usual production. Hoisted during the week 39 cars of first-class ore, sverage csr ssmple assay $175 per ton, and 169.2 tons of second-clsss, sversge sssay, $23.59 per ton.

COMMONWEALTH.—Esst line drift extended ten feet, exposing a small streak of first-class and two feet of second-class ore, which is being stoped. East intermediate drift from chute No. 3 exposed some high-grade ore, progress 16 feet. Third level stopes continue abont the same. Hoisted fonr cars first-clsss ore during the week, average assay $200 per ton, and 108 tons concentrating ore, average assay $22.79 per ton.

NORTH COMMONWEALTH.—Hoisted eight cars second-class ore, average assay $102 per ton, and one car first-class.

IDAHO.

THE VIENNA MILL.—Wood River *Times*, Sept. 3: The Vienna Company's mill is to be started up on Solace ore, but it will not make much of a run—not over three or four months—unless better prices are obtainable for silver, as the mine cannot be made to pay at present figures.

NEW MEXICO.

MILLINO —Silver City *Sentinel*, Aug. 30: The Brockman mill, at Lone Mountain, started up last week and is now treating from 25 to 30 tons of ore a day with 10 stamps running. There is a laige amonnt of ore, all of which can be milled at a good profit. There is a scarcity of water at the Mountain Key mill, and only a part of the stamps are now running. It is feared that the Pacific Gold Co. will have to suspend operations. There is a prospect that the affairs of the Last Chance Co. at Silver Creek will be straightened ont, and that the mill will be started up again soon. There is an immense body of low-grade ore in the mine which can be mined and milled at small cost. There is practically nothing doing at Hanover. The situation remains the same ss when the Atchison, Topeka & Santa Fe Rsilroad Co. refused to furnish any more csrs to the Silver City and Northern abont six weeks ago; but proceedings have been commenced which may result in the restoration of the throngh rates, when, in all probability, the shipment of ore from the camp will be resumed. The Mimbres Consolidated mill has been closed down in order to make some needed repairs, and ore is accnmulating at the mine. A great deal of work will be done at Black Hawk in the next few months. The number of men employed there has been increased considerably, and there is a good prospect that the camp will resume its old-time aspect before many months. The mines there have produced as rich silver ore as was ever taken out in the Territory, and they have not been worked out by any means. While the low price of silver is discouraging to silver miners, snch ore as is produced by the mines at Black Hawk could be mined and shipped profitably with silver even lower than it is now. The lixiviation plant, which is now being operated by P. B. Smith at Stein's Pass, has been doing satisfactory work for over two months. The low-grade ores from the Volcano mine, which have been accumulating for several years on the dump, will all be treated by this process, and there are other mines in the camp which could be worked to good advantage if there were facilities for working the ore by this process. The plant which is now in operation is small, but a larger one will be put up, when it is expected that the production of the camp will be considerably increased.

OREGON.

GRENHORN DISTRICT.—*Bedrock Democrat*, Aug. 30: Just prior to departing from Austin's, on the Middle Fork of the John Day, a few days since, it was the pleasnre of a *Democrat* representative to converse for a few moments with Mr. Taylor Althouse, one of the prominent mine-owners of the Greenhorn district. In speaking of the camp, Mr. Althouse stated that the wildcat schemers with whom that district was formerly afflicted were now conspicuous only by their absence, much to the gratification of those practicing legitimate mining. He informed the reporter that mine-owners were pushing development on their properties with good results. The old ledges improve as depth is attained, and to-day in this district are to be fonnd many well-developed properties, presenting msgnificent showings. Numerous new properties are also receiving attention which give promise of developing into first-class properties.

CONCENTRATES TO TACOMA.—Manager Robbins, of the Robbins-Elkhorn mine, was in the city yesterday, and when asked concerning operations at the mine, said that the *Democrat* might inform its readers that a four-horse wagonload of concentrates was hauled daily from the mine to this city for shipment to the Tacoma Smelting Works at Tacoma, Washington.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Market Reports.

Local Markets.

SAN FRANCISCO, Sept. 7, 1892.

General trade was interrupted by a holiday on Monday, and as there is another on Friday business will not resume its normal condition until next week, and even then, it is thougbt, buying will be slow owing to the State Fair attraction. It is claimed that the different district fairs have been better attended this year than for years past; this being the case, accounts to a certain extent for slack trade. Traveling salesmen report the prospects all that can be desired for a prosperous fall trade. They claim that retail merchants are carrying small stocks, and that when consumers buy the bulk of their winter requirements heavy purchases will be in order. Iron workers and manufacturers in general report a fair degree of activity, with some firms reporting orders ahead.

The local money market is reported essentially unchanged. The banks report a large reserve, for the season, on hand, while the demand, outside of advances on grain, is of a negative character. There are liberal disbursements in this and adjoining cities for improvements. While there is an absence of a spirit of speculation, yet there is more substantial improvements going on than even the better informed are aware of. These improvements call for heavy disbursements and keep large forces of men at work. In this city, it is claimed, that, outside of seafaring men, there are fewer idle men than ever before known. This speaks well for San Francisco. Those in positon to know claim that throughout the State very few idle men are to be found, and those found are idle more form choice than lack of work. Of course the fruit and grain harvests give employment to thousands of bands, but outside of these industries more men are claimed to be at work. The outlines for railroad construction in 1893 warrants the assertion that we will probably have more active times in next year than witnessed in the present year.

Eastern mail advices report a strong money market, with the rates of interest stiffening. Bankers that had out Call loans at two per cent have advised borrowers that 2½ per cent would be demanded. The advance was complied with. The stronger money market is said to be largely due to the calls from the central and southern States for crop purposes. While this may be the case, yet to the cholera scare much can be traced. It is but natural, when threatened with an epidemic, for the public to make preparations financially for the worst, and it does not take much money to be withdrawn by each person to make a large aggregate. Writing on the present condition and outlook, Woerishoffer & Co, of New York say: "No one can, of course, say what calamity may be in store for us in the form of disease or disaster, but, barring calamities against which human foresight is helpless, we see nothing but prosperity ahead of us. We prefer basing calculations on the chances of life and prosperity rather than on death and adversity." The above shows that the drift of opinion is in line with ours. The New York *Daily Stockholder* estimates the interest and dividend disbursements in that city during the present month at $25,000,000.

SILVER—There was exported in bullion by sea, in the past week, $110000 to Hong Kong and $69,000 to Japan. The market at home and abroad has held to fairly steady prices. The steadiness of the markets causes fear that the manipulators are planning for another break, yet possibly it may be due to the cholera scare preventing their carrying out the speculative manipulation which was programmed at the time the syndicate was organized. The low prices ruling for silver have caused many mines to close down, which, unless a recovery in prices sets in soon, will be followed by the closing down of other mines. The monthly purchases of silver by the United States are said to be greater than we produce.

MEXICAN DOLLARS—The shipments by sea the past week aggregate $340,271 to Hong Kong. The market is fairly steady at 67½@67¾ cts.

QUICKSILVER—Receipts the past week aggregate 444 flasks; 100 of the flasks were shipped back from Australia so as to get the difference between the export and home prices. The venture netted a nice profit. The market is weak. The exports by sea aggregate the past week 412 flasks to Mexico.

AMTIMONY—The market is weak and lower in sympatby with New York. The latter market was at last mail advices quoted as follows: 10¾c for Hallett's, 11¼@11½c for X. L., 11¾c for Crown, and 12¼@12½c for Cookson's.

LIME.—Receipts the past week aggregate 3,709 bbls. The market is reported fairly steady at $1.25 and $1.50 per bbl.

BORAX.—Receipts the past week aggregate 440 ctls, and exports by sail to New York 2020 ctls., and by steam *via*. Panama 1652 ctls. The market is fairly steady.

PIG LEAD.—There was shipped the past week to New Yotk 211,540 lbs. The market is steadier, the low freigbts to New York being in favor of sellers. The eastern markets are stronger with a free trade call reported.

COPPER—There was shipped by sea to New York the past week 121,766 lbs. copper matte. The market is irregularly weak. *Iron Age* reports to the New York market as follows: "Home consumers buy with no greater freedom, at all events, nor do export purchasers compensate in any noticeable degree for the slackness of bome buying. Production meanwbile continues on a liberal scale. Prices for Lake Superior ingot stand practically the same as they were a week ago, with 11¾c the popular quotation, but 11¾c to 11.65c a more correct representation of the basis at which the moderate business passing is effected. Electrolytic is generally quoted at 11c, but sells at as low as 10⅞c. For common casting brands 10½c is the general quotation, but some business is understood to have been done at a shade less."

TIN—Imports the past week aggregate 1607 ingots from Sydney. The market for hotb plate and pig is in buyers' favor. The Englisb market is cabled for pig irregular, with stocks kept within manageable proportions. New York mail advices report an inactive market.

PIG IRON—The market is essentially unchanged. English cablegrams report a further reduction in stocks, with a 2s advance for certain brands. New York mail advices report as follows: "A more satisfactory feeling is developing in Philadelphia, cheap lots growing scarcer, but Chicago shows a weakening though more active market, while Cincinnati and Louisville are dull. Pittsburg reports sales of Bessemer pig aggregating about 20,000 tons for forward delivery at $13.85 Pittsburg and $13.75 Wheeling."

COAL—Imports aggregate as follows: Seattle, 1470 tons; Baltimore, 2565; Nanaimo, 6203; Coos Bay, 800; Sydney, 5098; Newcastle, N. S. W., 3669. Total, 19 805 tons. The market for spot on passage and to arrive is essentially unchanged. The general feeling is that the market ought to rule higher, but it does not, which shows that sentiment is one thing but facts are another. It looks as if more consumers had prepared against an advance than the trade was led to believe. The list of ships on the way from, loading and to load at Newcastle, N. S. W., and also at Sydney, is lengthening, which is accepted as proof positive that unless we have an exceptional hard winter no higber prices need be expected this side of Christmas.

Mining Share Market.

SAN FRANCISCO, Sept. 7, 1892.

The market for Comstock shares has been irregularly active with a downward tendency. The senior member of one of the largest commission broker firms, says, that during the late activity, and when prices were the highest, his firm purchased several thousand shares of the leading mines on the Comstock for persons who paid cash and took the shares away. The purchases ranged from 100 to 400 shares each. We are informed that other brokers also made liberal purchases for outsiders. This, then, accounts for the lower and less active market the past week. The rings have evidently succeeded in entrapping a large number of assessment-paying operators. If they can only get a sufficient amount of shares out on the public, assessments and mine-looting are good enough. It is now a well-recognized fact that the movements of the mill rings and stock pools, are closely watched and for that reason more care is exercised how bullion is secured. It looks as if the rings are doing all in their power to wear out the patience of those who are on the lookout for mine-looting and other equally as nefarious acts, and when they succeed in tiring them out then the old game will begin, of misappropriating bullion and other various ways of enriching themselves at the expense of shareholders. It is a great game, this of working the Comstock mines.

Two assessments were levied the past week. Others are to follow soon. There are persons in position to know who claim that each mining company on the Comstock will levy and collect from two to five assessments within the next nine or ten months. Of course this is contingent on the success the rings have in peddling out shares and keeping assessment payers in the trap.

Some time ago it was given out that the Con. Virginia Co. would bave to levy one or more assessments, but few gave credence to the reports. The returns for the month of August indicate that the company is in debt.

The pay roll at Virginia of the Comstock mining company aggregated in August $143,840, an increase of $6407 over that of July. It is claimed that some of the companies report larger disbursements than are made, or if made, they are to persons not employed, and who probably divide the ill-gotten money. There are many tricks by which the money can be made, none of which appear to be missed by the rings. To deal in the Comstock shares with the mines managed as they now are, is like fooling with bot irons—no one can expect to escape being burnt.

The Silver King Mining Company, Arizona, is crushing rich ore. There are those who claim that dividends are likely to be paid in the near future. The only thing in the way to the paying of dividends is that the mine is said to be controlled by some of the members of the Comstock mill rings. The same stumbling block, it is said, is in the way of the Bodie mines being successfully worked. Of course 10 cent, or even 25 cent dividends may be paid for a short time by one of the companies in each district, but the only significance that would attach to the dividends would be a desire to peddle out shares in the different mines for assessing.

News from the Comstock mines is said to be confirmatory of dead or unimportant work. This is the outcome of the persistency of the Mining Stock Association in keeping close watch on the mills, ore sent to the mills, the bullion produced, and what becomes of the concentrates, tailings, etc. Evidently the rings are determined not to have any important developing work done, at least for the present; and it is probably as well they have come to this determination, for all outsiders have been getting for over a decade past out of any ore developed has been assessments, while the rings got the bullion. Of course part of the bullion produced at one time by the Con. Virginia Mining Company went to shareholders, but as dividends were paid the market value of the shares went down, carrying the price of all others with it. The dividends attracted outside buyers, who got the shares at bigh prices, and the rings got the cash, and, as usual, the former are out financially. Of course, there is no ore now to be found for outsiders in the mine, and probably never will be. When the shares are bougbt back at low prices, through assessments or otherwise, then rich ore will be accidentally, as it always is, found, the shares peddled out, and the old game successfully played. It is a great game, this of working the Comstock mines. The public is being treated to reports of finds, improvements, etc., in Sierra Nevada. In July this paper outlined the probable result of the work in the mine, and so far it has proven correct. The Pumping Association is not so free with information regarding the progress of the work looking to pumping out of the Gold Hill mines. There are those who contend that it will be a long time yet, with many assessments to be paid, before the mines are pumped out.

The market opened dull but firm this morning. After regular call there were crossorders for the purpose of supporting the market. Toward the noon hour prices were a shade higher. It looks at this writing, as if the rings will advance the market slightly; some claim that this will be done to keep those who have bought from selling and also get others to buy.

Mr. Tingman, secretary of the Mining Stock Association, called on Mr. Fisb, president of the Con. Virginia Mining Co., this morning for information as to whom the three stray bars of bullion belong, and what right one of the milling company had to them. Like dummy officials, Mr. Fish did not know anything, and had not made a move to find out. Mr. Tingman called on the lawyer for the company regarding the stray bullion. He promised to have a meeting of the directors of the Con. Virginia called, so as to have the subject examined into. It looks as if the mill company will not only have to give up the bars of bullion but force other developments. Why do not the mining companies conform to the laws under which they incorporated? If the law was conformed to, then, it is claimed bullion would not go astray and mine-looting would be of the past.

Eastern Metal Markets.

NEW YORK, Sept. 7.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	38½	83½	11 40	4 15	20 30
Friday	38½	83½	11 40	4 15	20 30
Saturday	38½	83½	11 40	4 15	20 30
Monday					
Tuesday	38½	83½	11 40	4 15	20 30
Wednesday	38½	83½	11 40	4 15	20 30

Quicksilver is irregular and easy. Borax is in heavy supply, but it is not being forced on the market. Pig Iron is unchanged. Tin is barely steady. Copper is unfavorably influenced by cholera in Europe.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

HEGOLA MILL AND MINING CO. Location, Mokelumne Hill, Calaveras Co. Capital stock, $100,000. Directors—Joseph Davis, H. J. Brand, Mary Davis, E. J. Elgy and Charlotte Davis.

SAN FRANCISCO AUTOGRAPHIC REGISTER CO. Capital stock, $100,000. Object, dealing in an automatic register machine for making and storing facsimiles of writings, impressions, indentations, cuttings, punchings, etc. Directors—F. A. Osborn, C. G. Young, Prentiss Selby, M. M. Stern, J. K. Wilson, J. T. Rucker, A. C. Rulofson, I. P. Allen, F. S. Chadbourne, J. J. McManus, Frank J. Stone, Nathaniel Hunter, George F. Eberhard, E. F. Osborn and W. M. Cubery.

NOLAN DRAYAGE AND WAREHOUSE COMPANY. Directors—W. H. Nolan, William Green, C. H. Kohn, W. E. Folley and Frank Sweeney.

PNEUMATIC POWER COMPANY. Directors—Charles Cummings, J. W. Stewart, W. S. Bell, G. L. Brown and William Johnstone.

MAGNOLIA M. AND M. CO., Boulder county, Colo. Capital stock, $1,000,000. Directors—W. D. Patty, John E. Norling, J. A. Nye, J. A. Tengarden, W. R. Hanze, P. O. Norling and J. J. Johnson.

ATLANTIC MINING AND MILLING CO. To operate mines in Kootenai county, Idaho. Directors—G. O. Morrell, of Pullman, Wash., and H. A. Slade, E. D. Faust, E. M. Gillette, Thomas Martin and L. H. Faust, of Kootenai, Idaho. Capital stock, $1,000,000.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING AUG. 30, 1892.

481,511.—ICE PITCHER—R. Arnold, Sacramento, Cal.

481 838.—IMPREGNATING LIQUIDS WITH GASES—U. Bachmann, Mission San Jose, Cal.

481,811.—BEANTHRASHER—P. Bourgin, Oakland, Cal.

481,612.—TOILET-PAPER HOLDER—M. A. Brown, Seattle, Wash.

481,845.—LAUNDRY DRYING-ROOM—J. E. Chappell, S. F.

481,847.—FIRE ALARM TELEGRAPH—A. J. Coffee, Portland, Or.

481,893.—CAN-LABELING MACHINE—P. Crittenden, S. F.

481,849.—FIRE ESCAPE—A. B. Cruickshank, S. F.

481,850.—AIR COMPRESSOR—M. Dillenburg, S. F.

481,555.—DRAG-SAWING MACHINE—L. Forsman, Athina, Or.

481,864.—THRASHING CYLINDER—Sam'l Hamilton, King City, Cal.

481,793.—CALENDAR CLOCK—Johnson & Hamill, Globe, A. T.

401,907.—CAR-COUPLING—J. Kindleberger, San Diego, Cal.

481,703.—REVERBERATING FURNACE—H. Mathey, South Riverside, Cal.

481,768.—LAMP STOVE—J. F. Meyers, S. F.

481,823.—SAW-FILING MACHINE—J. Richardson, S. F.

481,831.—AIR SUPPLY FOR BOILER FURNACES—I. V. Scholfield, Jr., S. F.

481,834.—SAFETY PIN—A. T. Snell, Ventura, Cal.

481,657.—GAME COUNTER—Sturgis & Peck, Presidio, Cal.

481,836.—SAWTOOTH—J. W. Todd, Portland, Or.

481,708.—PLOW—E. L. Ward, Santa Rosa, Cal.

The following brief list by telegraph, for Sept. 6, will appear more complete on receipt of mail advices:

California—John Buckley, Eureka, cable-logging machine; John E. Daley, Glendora, and A. A. Neil, Covina, orchard cultivator; George Gates, Jackson, separating sand and slimes; Frederick C. J. Grebe, Los Angeles, historical toy novelty; Leonidas Guillemet, San Francisco, slack take-up for brakes; Chas. F. Heath, Durham, saw-set and gauge; James McDonald, Los Angeles, water circulator and purifier for steam boilers; Alexander J. McAdam, San Francisco, elevator controlling mechanism; John D. D. Mortimer, Stockton, shipping receipt book; Frank C. Phillips, Healdsburg, fruit-pitting machine; Edward E. Thomas, San Jose, fruit dipper; Judge D. Thomas and E. E. Thomas, San Jose, fruit-pitting and spreading machine; Cornelius Toohey, San Francisco, grocer's caddy.

Oregon—Geo. W. North, Clarke's, clothes-drier; Abram C. Speer, Woodville, portable hand-sawing machine; George Williams and A. A. Cleveland, Astoria, pound net; Sanford R. Williams, Monmouth, car coupling.

Washington—Geo. C. Harlin, Seattle, car coupling; Balston C. Kenway, Tacoma, construction of seawalls; Geo. A. Kimball, Seattle, automatic trolley disconnector.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HYDRAULIC LIFTING DOCK.—Robert Morau, Seattle. No. 481,411. Dated Aug. 23, 1892. The object of this invention is to provide a simple and economical device for lifting vessels out of the water and for other similar purposes. This device may be used also as a transfer device to raise vessels, which are afterward transferred bodily from the dock to a wharf or other position, and it may also be used in connection with locks to transfer vessels from one water-level to another.

BEANTHRASHER.—Pierre Bourgin, Oakland. No. 481,841. Dated Aug 30, 1892. This machine may be drawn over the floor upon which the vines carrying the bean-pods are spread, and caused to traverse it from side to side until the thrashing is complete. Flexible arms, constructed in a peculiar manner, serve not only as heaters hut as forks or stirrers to lift the vines, so that when the machine again passes over them, new surfaces will he presented to the flails.

SAW-FILING AND SETTING MACHINE.—John Richardson, S. F. No. 481,823. Dated Aug. 30, 1892. This machine for sharpening and swaging sawteeth consists in the novel mechanism for effecting the adjustment or feed of the saw, to present successive teeth to the action of the sharpening tool, and finally in the novel mechanism for operating the swaging-hammer.

IMPREGNATING LIQUIDS WITH GASES.—Ulrich Bachmann, Mission San Jose. No. 481,838. Dated Aug. 30, 1892. This especially refers to the class of apparatus for automatically charging liquids with carbonic acid gas. The invention consists in charging and confining within the liquid receiving vessel or vessels a given supply of carbonic acid gas under pressure, charging the liquid-reservoir with a given pressure of gas, and feeding the liquid from the reservoir to the receiving vessels by allowing it to flow therein, whereby it displaces the gas in said vessels, increasing its pressure therein and checking automatically the continued flow of the liquid until a portion of the gas is absorbed, and the pressure thereby reduced sufficiently to again permit the flow, and so on until the liquid has all passed to the receiving vessels and the gas therein is completely absorbed by the liquid. The object of the invention is to provide a simple and effective method and means for thoroughly and automatically charging liquid with carbonic acid gas.

THRASHING CYLINDER.—Samuel Hamilton, King City, Monterey Co. No. 481,864. Dated Aug. 30, 1892. In the ordinary construction of thrashing machine cylinders, circular disks or spiders are fixed transversely to a central rotary shaft having bars around the periphery parallel with the shaft, and teeth are fixed in these bars at intervals by screw-threaded shanks at their inner ends, which pass through the holes in the bars and are secured by nuts on the inside. This construction is necessary because the outer ends of the teeth are made wedge-shaped in order to give them sufficient strength in the line of motion to resist the strain brought upon them by the straw and grain passing between the teeth of the cylinder and those of the corresponding concave at a high speed, and on account of this construction of the teeth must be put in from the outside. In Mr. Hamilton's invention he makes the teeth wedge-shape in transverse sections, tapering from the outer face of the cylinder bars to the point, with the front and rear edges parallel and forms a head upon the inner head of each tooth. Slots are made in the cylinder bars which are so shaped as to receive these teeth, which are introduced from the inside, and the centrifugal force of the cylinder when in rotation draws the teeth firmly into place with the heads against the inner sides of the bars and prevents their falling out. In the ordinary construction the weakest point of the teeth is at the junction of the teeth with the bar. In the improved construction, the strongest portion of the tooth is that portion in the bar and just outside of it. There are no screw-threads or nuts, and all the teeth in the cylinder may be slipped into their respective bars with the figers and if the heads do not exactly set at first they will be drawn into place by centrifugal force as soon as the cylinder is set into revolution. In order to remove them it is only necessary to tap them with a hammer outside, when they can be easily removed.

AIR-SUPPLY FOR BOILER FURNACES.—Ira V. Scholfield, Jr., S. F. No. 481,831. Dated Aug. 30, 1892. This device for supplying air to boiler-furnaces consists in a chamber surrounding the upper part of the furnace, with doors and openings through which air is admitted into the chamber, where it is heated from the furnace and is directed around the sides of the fire-door into the ash-pit below the grate-bars, from which it passes into the fuel space.

FIRE-ESCAPE.—A. B. Cruickshank, S. F. No. 481,849. Dated Aug. 30, 1892. This patent covers a fire-escape consisting of parallel vertical shafts, cages moving therein and connected with a single rope passing over guide-pulleys, an automatically-operating governor and brake and supplemental checks, whereby the speed of the downwardly-moving cage is regulated and checked and an elastic or spring platform at the bottom on which the cage is received.

*Assessment added.

Assessment Notices.

NOTICE OF ASSESSMENT.

KEYSTONE CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Amador City, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22d day of August, 1892, an assessment, (No. 3) of One Dollar ($1) per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room 43, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of September, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 18th day of October, 1892, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. H. ISHAM, Secretary.

Office—No. 310 Pine Street, Room 43, San Francisco, California.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the Pacific Coast Borax Company will be held at the office of the Company, Room 26, No. 101 Sansome St., San Francisco, Cal., on Monday, the 19th day of September, 1892, at the hour of 1:30 o'clock, P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting.

ALTON H. CLOUGH, Secretary.

DELINQUENT SALE NOTICE.

GOVER MINING COMPANY,

San Francisco.

Notice—There is delinquent upon the following described stock, on account of Assessment (No. 3) levied on the 28th day of July, 1892, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.

And in accordance with law, so many shares of each parcel of stock as may be necessary, will be sold, at the office of the Company, on MONDAY, the 26th day September, 1892, at two o'clock in the afternoon of such day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of sale.

ROBERT McF. DOBLE, Secretary.

Office, 13 Fremont St., San Francisco, Cal.

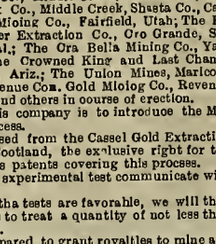
NEW DISCOVERY.

Mines Revived and Miners Enriched

By the wonderful **MacArthur-Forrest Process**, Controlled by The Gold and Silver Extraction Mining and Milling Co. H. A. W. TABOR, Pres.; LEONARD GOW, V. Pres.; H. A. JONES, 2d V. Pres.; P. GEO. GOW, Technical M'g'r. and Ass't Treas.; T. L. WISWALL, Gen'l M'g'r. and Sec,v; PETER MCCOURT, Treas.; W. L. COOPER, Eng.

DENVER WORKS: On the D. & R. G. R. R. near the Broadway Electric R. R. Depot.

TRADE MARK.



(MACARTHUR-FORREST PROCESS)

GLASGOW WORKS: The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Queensland, Etc.

General Office of Company:

Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: Denver; The Livingstone Gold Mioing Co., Boulder Co., Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co., Cal.; The Shasta Gold Ex Co., Middle Creek, Shasta Co., Cal.; The Mercur Gold Mioing Co., Fairfield, Utah; The Pacific Gold and Silver Extraction Co., Oro Grande, San Bernardino Co., Cal.; The Ora Bella Mining Co., Yavapai Co., Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Con. Gold Mioing Co., Revenue via Norris, Mont.; and others in course of erection.

The object of this company is to introduce the MacArthur-Forrest process.

We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.

If you desire an experimental test communicate with the secretary.

If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons in Denver.

We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.

The process consists of pulverizing the ores to a fineness of about 50-mesh, and then subjecting the same to an action of a very dilute solution of cyanide. A few tubs especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.

The total cost, as as rule, does do exceed from $2.50 to $5 00 per ton.

The most desirable class of ores for this process are the so-called refractory gold, ores pyrites, hematites, manganese and tellurium. We have also treated successfully dry silver ores.

We will be pleased to answer any inquiries and furnish any desired information. Address,

T. L. WISWALL,

P. O. Box 926. Gen. Mgr and Secretary.

J. H. & D. LAKE CO., MANUFACTURERS OF FRICTION CLUTCH PULLEYS and CUT-OFF COUPLINGS. WRITE FOR ILLUSTRATED CIRCULAR.

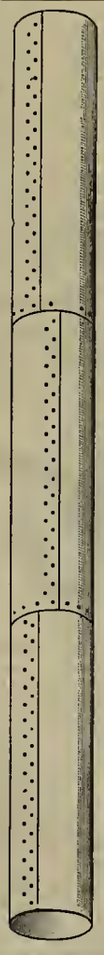
SHEET IRON PIPE



IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.
— WE MANUFACTURE —
SHEET IRON AND STEEL PIPE,
ALL SIZES.
For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.
Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade o annealed Charcoal Iron of great tensile strength.
The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will he subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, PITCH and PETROLEUM, at a Temperatnre of 300° Farenheit. it thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practioally indestructible.

VULCAN WIRE ROPEWAY,
o Conveying ORE, CORDWOOD, ETC.

SNYDER MINE, CAL.
In reply to your inquiry as to how the Tramway is doing, am prepared to state that it has given ENTIRE SATISFACTION IN EVERY PARTICULAR. We can easily transport 65 tons of ore in 10 hours, with two men to load and one to tend brake, and with all the Wood Carriers on, we can transport 14 cords of wood in the same time.
When I look back upon the time when I was paying at the rate of $2.50 per ton for hauling ore, whereas it is now done at the rate of 12½c. per ton, making a saving of $150 per day, and also, where it formerly cost me $5.50 per cord for wood delivered at mill, it now costs me but $3 per cord making a saving of $2.50 per cord—I must say that I feel pretty well over my Tramway investment for it is a PERFECT SUCCESS.

The "Success" Turbine.

Smith's improved "Success" water-wheel is being introduced on this coast by the Pelton Water Wheel Co. for the purpose of utilizing lower heads than the Pelton wheel can be operated under to advantage. It will probably be put on at Folsom, in this State, and at the Willamette falls. Tests made by the Holyoke Flume Co. on this wheel have shown an efficiency of 90 per cent, with a loss from full to half-gate of only 12 per cent, conceded to be quite the most remarkable showing ever made for a wheel of this class. The high efficiency under part-gate is a feature of special value, affording an adaptation to a variable water supply without the serious loss incurred in all other turbines, while the useful effect is maintained under the lowest head it is ever deemed practicable to utilize.

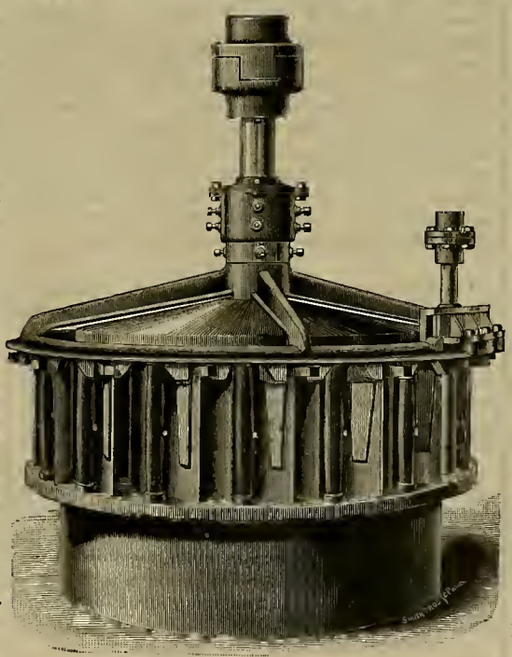
It is conceded that next to efficiency, no feature in a water-wheel compares in importance to that of reliability. They are generally used in remote and often inaccessible localities where repairs are made at great disadvantage and much expense as well as loss of time. Wheels of this class, it is well known, are in many cases very unreliable, involving a degree of uncertainty that discredits the many advantages such a power ought always to afford. The good accounts given of the "Success" turbine by parties using them in every variety of service and under widely varying conditions, give assurance that they embrace the best features of turbine practice, and that the construction is such as to afford all possible security against irregular and unreliable work.

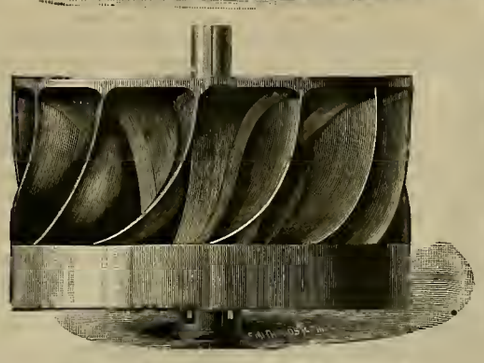
Some of the more marked and distinguishing features of the "Success" turbine are as follows: The gates are especially heavy and strong and are operated by a series of pivoted levers having no joints excepting the pivots on which they swing, making an entire absence of links, bolts and other contrivances for adjustment, which are a source of so much trouble in other wheels. The buckets in the runner are made of steel and are not liable to break by drift getting into them. The outer edges being turned forward they present sharp lines to the opposing or incoming water, materially reducing resistance and augmenting the power. These sharp edges also cut sticks, roots or other foreign substances so that they will go through the wheel without clogging it. The openings of the runner being larger than the gates, any obstruction that will pass the gates will easily pass the runner. But little resistance is presented when running in backwater, a point of much importance where wheels are submerged. The gates work with such ease and freedom as to admit of better regulation than can be obtained with any other form of turbine. Wear on the step is entirely obviated by the admission of water into a chamber at the lower end of the shaft, which prevents heat and consequent friction. These peculiarities of construction, it will be seen, are not only a great advantage in general utility and efficiency, but afford protection against accident and insure a degree of reliability not embraced in any other wheel of this class. Governors are furnished which are guaranteed to afford close and sensitive control under all variations of load. The "Success" wheel is largely used for driving electric machinery.

Among the Foundries.

The foundrymen of this city are reaching out for trade much more than was formerly their custom. This is especially the case with respect to the Mexican business, men being sent down into that country looking after orders. The Mexican machinery business should naturally come to this city, but the enterprise of eastern firms has turned some of the trade in that direction. Nearly all the large mining machinery used in the mines of Mexico is made in this country, and for many years the orders came to this city. The machinery was shipped to the coast ports and then carried inland. The completion of the railroad made it easier to ship to Chihuahua and Durango, as well as to Sonora and Sinaloa, the latter States on the coast-line. But the eastern manufacturers took advantage of this and entered the field also. The Mexicans are apt to give the orders to those who seek them, so that the local foundrymen of late years have been sending agents through the mining regions in search of contracts. It was on one of these trips that Mr. Fraser of the Risdon Works was murdered by his guide.

BELL'S IMPROVED STEAM HAMMER.





SMITH'S "SUCCESS" TURBINE WHEEL.

The foundry business in this city at present is unprecedentedly dull. With the exception of ship-building, there are very few large contracts in hand. Of course, there is more or less repair and small work, but most of the foundries and machine-shops are running short-handed. The larger shops have fewer men on the rolls than is usually the case at this time of the year, owing to lack of orders. There is no expectation of any special revival of business until the conclusion of the political campaign. At present, there is universal complaint of dull times.

Bell's Improved Steam Hammers.

The advantages obtained by the use of steam hammers are now universally acknowledged, not only in rolling-mills and large forges, but in every ordinary smith's shop, by which a great saving of wages, time, fuel and material is effected, besides improving the character of the work and decreasing the amount of labor required in finishing by machinery and vise work. Various systems have been devised and adopted to meet the want, but the cost has been the great obstacle to the introduction of steam hammers to the ordinary smith's shop.

Bell's improved patent steam hammers have completely overcome this obstacle. They are of very simple construction, having single-column standards, with bed-plates and cylinders cast in one piece, very strong, self-acting, and taking steam at both ends of the cylinder; all of the sizes striking a square blow. Either of the sizes will strike a heavy or light blow, as required, and can be worked either "double acting" or "single acting," the change being easily and quickly adjusted. They are superior to belt, trip and helve styles, easier to use and keep in repair, and much cheaper in cost than any form yet devised that will perform the same amount of service.

There are four sizes of these hammers built, the accompanying cut representing size No. 1. The sizes Nos. 2 and 3 will work up old car axles and make the best iron that can be produced for connecting and eccentric rods and all parts of engines and other machinery where the best quality of iron is necessary. They will also work up old scrap, quantities of which are always to be found in blacksmith shops, and produce the best of iron for all ordinary purposes.

The size No. 4 is constructed with the view of supplying, at a very moderate price, a hammer that will forge large and heavy cranks and shafts and the frames and other bearings of locomotives, not only with expedition, but with the greatest accuracy and saving of labor; and it is claimed that twice the number of locomotive frames and bearings can be turned out in the same time that can be done with the appliances hitherto employed in doing the same duty. With a heating furnace this size (No. 4) will work up scraps into billets for making car-axles, crank shafts and all heavy forgings which have heretofore required large and very expensive hammers to accomplish.

The sizes of these hammers which are usually adopted (being from one to six tons capacity) are found to be eminently suitable for iron and steel manufacturers, ship-builders, railway-car builders, engine-builders, wheel-makers, shipsmiths, iron-bridge builders, filemakers, cutlers, coppersmiths, gunsmiths, carriage-builders, bar-straightening for smithies and generally for pressing and stamping iron into required shapes. These hammers are built by David Bell of Buffalo, New York, and the agency for their sale here is entrusted to the Joshua Hendy Machine Works of this city.

THE Executive Committee of the California Miners' Association have passed a resolution postponing the annual convention from Oct. 10th to Tuesday, Nov. 15, 1892.

Comment.

Melville Attwood, the well-known mining engineer of this city, recently had occasion to examine the milling methods of a mine in Siskiyou county, to find out why the percentage of loss was so large. In his report to the owners occurs the following: "The principal matrices of gold in auriferous veins consist of quartz and pyritic matter. The gold in the quartz is generally found in coarse or large particles and is easily liberated by coarse stamping. In California it is commonly termed 'free-gold.' The gold in the pyritic matter for the most part is in a fine state of division, and in the cubical pyrites sometimes by dissecting the crystals the cleavage faces will be found distinctly gilded. Therefore by fine stamping, like that in use at this mill, a very large proportion of the gold will be held in *suspension* and carried away." This is a very suggestive statement and bears out the ideas and experiences of others. Mr. Attwood made a microscopic examination of the pyritic crystals and was easily enabled to find the gilded faces. It is very possible that in other cases where the milling percentage obtained is small, it may be due to crushing too finely. If the crystals of the pyrites are broken and this extremely fine gold freed, it will doubtless, as Mr. Attwood says, be carried off in the flowing water.

It is a triumph of mechanics, rather than one of physical excellence, which has enabled a man to travel a faster mile than the fastest trotting horse on a circular track. Nancy Hanks recently recorded the fastest mile of a trotter on a circular track at 2:07¼. She afterwards reduced this time on a kite-shaped track. A few days after her first performance a young man named Zimmerman, on a three-lap circular track at Springfield, made a mile in 2:06 4 5 on a safety bicycle. It is noteworthy also that the mare made her fast mile with one of the new sulkies, having bicycle wheels, with pneumatic tires. In both cases the tires used were pneumatic and the wheels had ball bearings. The pneumatic tire is simply a large rubber tube filled with air, and so arranged that if the air leaks out it may be pumped in again, with a small air-pump which may be carried in the pocket. The original tires for bicycles were of solid rubber. Then came the cushion tire, of larger diameter, made hollow; and now the pneumatic is all the rage, and is applied to most of the new machines. With it one may ride over sand or pavements, heretofore impassable to bicyclists, since it gives a broader bearing surface and at the same time is elastic. It also takes a good grip on the surface and is not apt to slip or slide. The ball bearings of these machines are entirely different from the ordinary bearings or axles of vehicles. In the hub of the wheel is an annular groove containing a number of small balls of chilled steel. These encircle the axle of the bicycle, which passes through the center of the ring of bal's. The oil and graphite, or other lubricator, is placed in the box with the balls. It is obvious even to persons not well versed in mechanics that the bearings on which a shaft turns should be true circles concentric to its axis and therefore to each other. In a ball bearing the grooves or surfaces upon which the balls roll are true circles. Adjustment of the bearing so that it will run freely without shake or side-play is necessary, especially after wear. In the cap covering the balls, by screwing it up one notch the space allowed to each ball is narrowed one fifteen-hundreth of an inch, making a perfect adjustment for wear. In a modern safety bicycle, with its many bearings, there are 190 balls, including those in the wheels, the head and the pedals. The friction in the wearing parts has been wonderfully reduced. These machines are marvelously strong and light and may be considered one of the triumphs of modern mechanism. Very slight exertion is required to propel them. That great speed may be attained with them is shown by the record given above. Of course an exceptionally skilled man was required to accomplish the feat, but many riders come within a few seconds of the time in using these machines. By the way, it is of interest to note that in Germany alone 1700 men are employed in making the balls for these bearings, and England and this country there are many more.

A few cases of Asiatic cholera have appeared in the city of New York, notwithstanding the strongest quarantine against vessels from infected ports. None of the people who died ashore came in the vessels, and it is not known where they contracted the disease. The authorities are making every effort to keep the disease from spreading, and thus far have been successful. The appearance of the dread scourge in the metropolis of the country will have the effect of causing all other cities and towns to commence immediately with such precautionary measures as seem best. For the next few months there will be a spasm of cleanliness in all parts of the country. If the disease can be held in check in New York for another month, the cold weather will prevent its spread this winter, though it may be expected to revive with the warm weather next summer. However, by that time every preparation will have been made to fight its progress. It is not probable, therefore, that the cholera will obtain the foothold in this country that it has in parts of Europe. There need be no panic over the appearance of the disease, for Boards of Health and other official bodies will use every effort possible to reduce the mortality by compelling strict cleanliness of premises in all quarters.

Joseph Aron of No. 30 Rue Bergen, Paris, France, formerly a well-known operator in Comstock mines, has had Judge Hebbard's decision in the Fox *vs.* Hale & Norcross mining suit translated and printed, and has circulated thousands of copies among people in France, Germany and England who have been interested in Comstock mining shares. This result of this will be that it will be difficult to get any of these people to invest any money out on this coast, for they mix up California with Nevada. The revelations made in this suit, as to the methods pursued in the management of the Comstock mines, were startling and not at all calculated to give people confidence in the companies. Now that European mining investors are in a position to understand the decision in the case, it will be very difficult to get them to put money into mining properties out here.

At the last meeting of the Board of Supervisors of this city and county the Street Committee presented a resolution repealing the ordinance prohibiting the erection of poles and overhead electric wires excepting on certain streets, as the law as it stood prevented competition. Mr. Taber explained that the repealing of the ordinance would not give the right to build such roads unless the board should see fit to grant such privilege. The resolution was ordered to print. In most of the larger cities of the Union grave objections to the use of overhead wires are recognized. Boston has them, it is true; but New York and other cities still hold out against the trolley system. For smaller towns and for suburban traffic the overhead wire system answers well enough, but not for crowded thoroughfares of a great city. It is, of course, effective as far as moving the cars is concerned, and as a cheap form of construction, but the danger from live wires of this kind, when accidentally broken, is such that some other means of furnishing the current to the cars are being earnestly sought for. There is now on the books of this city an ordinance against the use of overhead wires for cars. In certain districts the electric cars would be found very useful, but the general introduction of the trolley would be objectionable. We have now the best system of streetcar service in the country. Cable roads are, however, expensive to build and for this reason many companies are anxious to introduce the trolley system where new roads are needed. If the Supervisors could be relied on to exercise good judgment in granting franchises, it might do to change existing conditions; at the same time, with the matter left wholly in their hands, the franchises might go by favor.

The Consolidated California and Virginia Mine.

The returns from this mine for the month of August are now at hand and do not give any particular cause for satisfaction to the shareholders.

There were 4350 tons of ore worked, which, according to the average car samples for the month were worth $112,708 50. The yield in bullion for the month was $72,849. Of this there was $32,170 in silver, from which 35 per cent or $11,259 50 must be deducted for discount on silver, leaving $61,589.50 as the net returns to the company.

The average car sample assay for the month was $25.91; average battery assay, $22.13. The return in bullion per ton, $16.74. The mill returned 64.63 per cent of the car sample assays, and 75 64 per cent of the battery assay. The net return to the company is $61,589 50 Out of this there is paid for milling and transportation, $6 per ton on 4350 tons which amounts to $26,100, leaving for the company $35,489.50. The original value of the ore at mill was $112,708 50, so a shrinkage is shown of $77,219.

The mill company which has the contract for working this ore is known as the Comstock Mill and Mining Co. According to the sworn testimony of John P. Jones and John W. Mackay, this milling company is owned by Jas. L. Flood, John P. Jones and John W. Mackay. The latter testified in the Hale & Norcross case that it was the former custom for mills on the Comstock to pay 65 per cent of the wagon-sample assay (equivalent to the car-sample) for ore and charge nothing for milling, as they could and did obtain ample remuneration for their work from the 35 per cent retained by them.

Under the present arrangement, the mills keep the 35 per cent and also charge $5 per ton for milling, and the transportation company (the Virginia and Truckee Railroad) gets $1 per ton for carrying the ore about 20 miles. The indications seem to be that the company will be compelled to assess its stockholders to pay the expenses of extracting this ore, which was worth $25.91 per ton, or $112,708.50 at the mine, and $35,489.50 in the company's office.

It is a notorious fact that this ore can be worked up to (in fact is now) 90 per cent of the battery assay, but the difference is fraudulently appropriated by the mill company. On the 4850 tons of ore belonging to the Con. Cal. and Virginia mine, worked during August, the mill company got for milling $21,750, and 15 per cent of bullion appropriated $16,906 27, making a total of $38,656 27. The mining company itself got $35,489.50.

It is such management as this that has driven the public out of the stock business. They see that ore assaying $25.91 per ton, when mined and worked on the Comstock, brings the company in debt, and they can easily see that nothing but fraud or the most reckless management could produce such results. Taking either horn of the dilemma they see that they will be the sufferers, while the millmen and those who furnish supplies and transportation will be the gainers.

It is useless for people to purchase shares in the Comstock mines until such methods as these are changed. Great incomes are maintained by them, it is true, but do not come to the shareholders who own the properties producing the ore.

THE CŒUR D'ALENE TROUBLE.—The nonunion miners have adopted legal tactics against certain property-owners in the Cœur d'Alene mining district, for damages accruing out of injuries received during the troubles there. Attorneys Hyde and Glass will file suits immediately for 12 clients in the State Court of the First Judicial district of Idaho against the Helena and Frisco Mining Company. The plaintiffs in the suits are men who were employed in the Frisco mill when the latter was blown up with giant powder, and who received various injuries at that time. The aggregate amount sued for will approximate $120,000, and the attorneys in the case believe their clients have excellent grounds for action. These men state that they were induced to go to work in the Frisco mill on the representation that there was no trouble, prospective or otherwise, and that their lives and property would be absolutely inviolate. Instead, they claim they were shot at, some of them wounded, and more or less of their private effects destroyed. The suit promises to be an interesting one.

An Astronomical Discovery.

On Friday night of last week E. E. Barnard discovered, with the Lick telescope, a new satellite of Jupiter. This is the first important discovery made by means of the magnificent instrument on Mount Hamilton, the largest refracting telescope in the world. This fifth satellite revolves in a period of 11 hours 59 minutes. Its distance from the planet-center is about 112,400 miles. It was observed by Mr. Barnard at east elongation September 10th, twenty hours and fifty-three minutes and twenty-one seconds Greenwich mean time. Its magnitude is the thirteenth.

From the amount of light reflected by this tiny moon, Mr. Barnard states that it is certainly not more than 100 miles in diameter, and is probably less. It is so close to the primary that the greatest possible distance from the edge of Jupiter at which the satellite may be observed is 36 seconds of arc, or say about two-thirds the diameter of the planet itself.

In speaking of his discovery, Mr. Barnard said that the new satellite is certainly as faint as the thirteenth star magnitude, and probably much less. In the great Lick refractor it appears as an exceedingly tiny star, in very rapid motion. The movement was clearly exhibited in the successive micrometer measurements, so that there could be not the least doubt about the character of the discovery.

Mr. Barnard spoke of one curious feature apparent in the study of the fifth Jovian moon. The period is so very nearly one-half a solar day that for months at a time only one elongation is visible at any one place. For example, at the present time only the eastern elongation can be seen in the United States, since the western elongation takes place during daylight. At the European observatories the reverse is the case, and consequently Vienna and Nice will for some time secure careful observations of the western elongations of this new body.

The four well-known satellites of Jupiter were the *first* heavenly bodies ever discovered with a telescope, having been found by Galileo in January, 1610, or over 282 years ago. Since then every astronomer has carefully observed and every telescope ever built has been pointed over and over again at the great planet and his retinue of four large moons. The great telescopes, year after year, have been employed during opposition, when the planet is seen to the best advantage.

It is to this fact that the discovery of the fifth satellite is so startling, astronomere believing there was nothing left to discover. The discovery ranks with that of Neptune in September, 1846, and the satellites Ariel and Umbriel of the planet Uranus in 1851, and the little moons of Mars, by Hall of Washington, in 1877.

Mr. Barnard has found more comets than any living astronomer, having discovered 16 in 12 years of extraordinarily hard work, yet all this is as nothing compared to his great find of last Friday night, when, for the first time in nearly three centuries, something was added to our knowledge of the moons of Jupiter.

This announcement will not only add to the laurels of this already famous young astronomer, but will give a reputation to the great telescope that one week ago was not thought of. Its work has thus far been somewhat disappointing, but hereafter more will be expected of it.

While Mr. Barnard's discovery will not add to our knowledge of astronomy nearly so much as discoveries made within the year and which have not been heard of outside of astronomical circles, it forcibly illustrates the fact that the solar system is not fully explored, and we may look for other startling discoveries within our own system.

Working Low-Grade Tin Ores.

We have not thus far been very successful with our tin-mining in this country. The California mine is rather pockety, and while tin has been produced, there has not been such a quantity as was expected. Still, a good body of ore may be met with in the prospecting operations at any time. The tin mines in Cornwall, England, succeed in working a very low-grade of ore indeed, and with experience, we may do so here. In the stockworks of Wheal Prosper and Mitchell, the killas is usually very soft and generally light-colored, *i. e.*, gray or white, or stained a yellowish-brown by oxide of iron. In some places near the veins the killas is converted into a soft tourmaline schist. The veins themselves are mere stringers, rarely more than one-eighth inch thick. In addition to quartz and cassiterite, a little gilbertite is noticed on them. The quantity of oxide of tin contained in the stuff is exceedingly small—not more than three pounds per ton of rock on an average—say 0.13 per cent—and it is really astonishing how such stuff can be worked without incurring a considerable loss.

Taking the oxide of tin, or "black tin," at £42 per ton, the pound is only worth 4½d., so that the ground as it stands is only worth 1s. 1½d. per ton. This amount has to cover all expenses of blasting, breaking, tramming a quarter of a mile, besides stamping and dressing.

Some of the reasons why the stuff can be treated so cheaply are stated by Prof. C. Le Neve Foster, H. M. Inspector of Metalliferous Mines, as follows:

1. The rock is soft and friable and easily stamped.
2. The tin ore is in large grains, consequently the rock need not be stamped fine, and the subsequent washing operations are greatly facilitated.
3. The substances mixed with the tin ore are specifically very much lighter and easily separated by washing. There are no pyrites to necessitate calcination.
4. There is waterpower at command.

In spite of all these advantages there is much to marvel at in the results; and, indeed, it is doubtful whether there is any place in the world where such poor tin rock is being treated as at Wheal Prosper.

Coast Industrial Notes.

A BRIDGE is being built across the north fork of Mad river, Humboldt Co., to Korbel.

THE Chino sugar factory is running night and day and turning out about 100,000 pounds of sugar every 24 hours.

THE Grass Valley Gold Extracting Co. is sending 50 tons of chloride of lime to San Francisco for disinfecting purposes.

THE Comstock Tunnel Co. has ordered smoke consuming locomotives from an eastern company. They are to be used in the tunnel for the transportation of rock.

THE Oakland Consolidated Street Railroad Company has applied for a franchise for an electric road on Second street between Broadway and Market. The application has been referred to the franchise committee.

J. H. HENRY and associates, the owners of the electric railway from San Jose to Santa Clara, have petitioned the Council for a 25 year's franchise to furnish electric power for mechanical purposes throughout the city of San Jose.

BIDS for furnishing 2500 tons of Sydney coal to the equipment department at Mare Island were opened this week, and the contract was awarded to Husband & Brooks of this city, who were the lowest among a large number of bidders.

THE proprietors of the Taylor Paper Mill, in Marin county, declare they will shut down the mills if they are compelled to obey the law which prohibits them dumping the refuse in Paper Mill creek. Suit has been brought against the mill company to compel it to keep the chemicals and refuse out of the creek.

EMORY OLSEN, a surveyor on the S. F. & Great Salt Lake R. R., says that the various parties are making permanent surveys, and that there are now two parties in the field between San Francisco and Oroville. When Oroville is reached from the south, the survey will be permanent and complete from San Francisco to Beckwith, probably to Salt Lake.

THE city of Alameda has ready for use a salt-water plant for street-watering. It is located next to the electric light works, near the bay shore, and there will be two hydrants —one on Park street and the other on Park avenue. If the experiment proves a success the system will be extended throughout the city, thus effecting a large saving, as the city is now paying about $3000 per month for fresh water.

BEHREND JOOST, representing the San Francisco and San Mateo Electric Railway Co., has made application to the Board of Supervisors for a new franchise which includes the route now being operated together with supplemental branches. Permission to use overhead wires is also requested. The desired change will not effect the present rate of passage and but one fare will be charged over the entire road.

THE following number of men is borne on the rolls of the various departments at Mare Island Navy Yard at the present time, and unless a great urgency arises the number will not be increased during the next two months, or until after the November election: Construction and repair, 390; steam engineering, 155; yards and docks, 102; equipment, 37; supplies and accounts, 23; ordnance, 13; medicine and surgery, 1; total, 721. The number of men actually at work is not more on an average than 620.

PRESENT appearances are that the granite-cutters' strike will continue for some time. The firm of Phillips & Co., owners of a quarry near Rocklin, has received a communication from its employes, announcing they had decided to demand $4 a day and eight hours on December 1st. Mr. Phillips declares that he will not accede to the demand because the men are under contract to work until next May for $4 for a nine-hour day. It is stated by employers that the Fresno county strikers are willing to work under the nine-hour schedule, but because the union in this city objects to such submission the present rupture continues.

THE prospects of the San Francisco and Great Salt Lake Railroad are said to be very encouraging. New capital from an unexpected source has been subscribed, and by the time the full details are made public all will be in readiness to commence the work of construction. E. L. G. Steele, one of the principal promoters of the undertaking, is authority for the statement that there is no doubt whatever of the building of the road. Four surveying parties are in in the field between Suisun bay and Beckworth pass, and the work is being done very thoroughly. The road from Sacramento to Oroville is to be built first and put into operation at once.

THE big lumber raft from Fort Bragg, Mendocino Co., arrived in this harbor safely on Sunday morning, in tow of the steam-schooner Noyo. Although rafts of piles have been towed down before, this is the first time that a built-up cigar-shaped raft of lumber has been successfully towed on the Pacific, there having been several break-downs in previous ventures of this sort. The raft is understood to contain 1,000,000 feet of lumber worth about $75,000. It was towed down in 34 hours. The Fort Bragg Lumber Co. had some trouble in launching the raft owing to its draft of water, but the spring tides floated it and the venture was a success.

THE new railroad from the vicinity of Lower Soda Springs, at Soda creek, has been built a distance of two miles, with roadbed graded another mile to the new sawmill owned by the Red Cross Co. This mill is located on Soda creek at the Siskiyou and Shasta county boundary line, and the railroad connection will afford an easy and cheap method of shipping lumber to the markets below or elsewhere. As soon as the railroad is completed to the mill, it will be started on cutting up the dense forests of timber in that section, with intention of extending the railroad to Battle's and McCloud river, where the Red Cross Co. own several sections of fine timber, and where another fine sawmill belonging to this company and other mills are located.

SALEM, Oregon, will soon have a fine electric light and power system. F. R. Anson, the manager, is engaged in making preparations for starting the new plant. The boilers and electrical machinery have arrived and are already placed temporarily, and the only thing to hinder the progress of the work is the nonarrival of the 375 horsepower Corliss steam engine which was expected here on the 15th of August from Sioux City, Iowa. Mr. Anson sets Oct. 15th as about the time when the new station will be started. He has eight dynamos, and expects to have two more at no distant day. One is a power generator with a horsepower of 125, with which the company expects to supply the power for the Salem Motor Railway Co.'s electric line and also for the innumerable dynamos which will be used to run sewing-machines, printing presses, etc., about town. There are also five arc dynamos, with a capacity of 170 lamps, and two incandescent dynamos with a capacity of 2000 lamps.

THE many lines of electric railroads now building in Oakland will be completed and in operation by the end of the present year. The Telegraph-avenue line, now under construction by the Pacific Improvement Company, which is said to be the finest piece of street railroad construction in the country, has been nearly finished and it is the intention to have cars running on the avenue by the 1st of January. The Fourteenth-street road, owned by the Consolidated Piedmont Cable Company, will be in operation by the 1st of October. Work on the electric road from East Oakland to central Oakland is progressing rapidly, and by the first of November this branch will be in operation, and then the cars of the Haywards road will be run into Oakland on the Berkeley company's new tracks. The Piedmont company intends to equip its West Oakland and Adelioe-street branches with electricity as soon as its Fourteenth-street road is in operation. At the last meeting of the City Council the company made application to extend its Adeline-street branch down Adeline street from Seventh to First.

C. A. MCFAUL, of Miller, having obtained a contract from the Southern Pacific for the supply of 200,000 7x9 railroad ties, has started three tie camps on the north fork of the Gualala river, Mendocino county, under the personal supervision of his brother L. R., who is tie receiver and general manager, residing at Camp 1, which is located about half a mile above the end of the Gualala Company's old railroad. There is a large body of timber to be worked, some of which is on large flats along the river. The Southern Pacific people here turned over a new leaf in the matter of receiving ties. In order to pass as first-class, a tie has to be almost perfect—no sap, no big knots, no windshakes, no weather cracks. So rigid an inspection has given the tie industry a bad black eye, as to meet these requirements a man, in order to make wages in a heavy and hazardous occupation, must have first-class timber. This nowadays is mighty scarce, as it is a select few among crews make $40 or $50 per month; others not so very select, and who hire their hewing done, from $25 to $30. One hundred and fifty ties is considered to be a good week's work; twenty a day is not to be sneezed at. First-class ties call for 10½ cents, timber down; second-class, 9 cents.

Nevada County Miners' Association.

At the annual meeting of the Miners' Association, Nevada county, the report of the secretary showed that the receipts from certificates amounted to $1195; donations, $315; total receipts, $1510. The total expenditures amounted to $1397.60, leaving a balance in the treasury of $112.40.

The total membership of the association is 1195.

The same constitution and by-laws as were previously in in force were again adopted.

The report of the executive committee was read and adopted.

Alf. Tregidgo was reelected president. The old vice-presidents were reelected, J. G. Mather of Malakoff being elected by acclamation to fill the vacancy caused by the death of D. R. McKillican. W. F. Englebright was re-elected secretary by acclamation. W. T. Morgan was elected assistant secretary, by acclamation. B. F. Snell was elected treasurer, by acclamation. The executive and finance committee were likewise reelected by acclamation.

Delegates to the State Convention, which will be held at San Francisco on October 10th, will be appointed by the executive committee, as there are to be 122 delegates. The president and secretary will issue the credentials. An effort will be made to send a full delegation, and all mem-

hers are requested to send in a list of persons who will go as delegates if elected.

A communication from the State Association, asking for funds, was referred to the executive committee.

Frederick Zeitler offered the oames of 25 new members, which increases the total membership to 1220.

More Cyanide.

SAN FRANCISCO, Sept. 12, 1892.

TO THE EDITOR :—C. H. Aaron's criticisms of my suggestions relating to the practical working of the MacArthur-Forrest process, seem to demand a brief reply. I did not intend to irritate anyhody, hut meant what I said for the good of practical miners especially, not for professional chemists, who are, like professional doctors, jealous of specialists.

He begins hy denying the "selective affinity" of cyanide for gold and silver, "dissolving them hy preference, leaving the hase metals untouched," under certain conditions, and then admits its correctness in the following words: "To the unchemical reader it may appear to he sustained hy the *fact* that *in practice* gold and silver are (more or less) dissolved, leaving associated iron pyrites, galena and some other hase metal compounds unacted on"—zinc blende, for instance. If that does not confirm the selective affinity theory, I do not understand plain English. The whole question depends upon whether cyanide of potassium is a positive or negative solvent. He asks, "What warrant is there for calling a solution of cyanide 'positive?'" None whatever, except what our reasoning power gives us. I arrested the idea without any such "warrant" as he will recognize. The *fact* which he admits, as above quoted, is established beyond question, and I offered my suggestions in explanation. He insists that cyanide, like acids, chlorine and other solvents in use, are negative and must necessarily attack zinc in preference to gold, hecause he can find no warrant in the hooks of the old chemists for any other conclusion. How far would electrical science have progressed in the last 20 years if Edison, Tesla, Brush, Thomson and other inventors had depended upon the writings of Faraday, Maxwell, Bequerel or Wedeidemann for authority instead of their own hrains?

Cyanogen is composed of two negatives—carhon and nitrogen—negative to gold, of course. Its position in the scale of electrochemical affinities has never heen determined, that I am aware of, hut it is probahly even more negative than oxygen, judging from its energetic action. As potassium is the most positive element in the scale, it is plain that, in a solution of cyanide of potassium, gold does not displace either of the elements composing it, hut uoites with the cyanogen, forming a double cyanide of gold and potassium; nor does zinc, when used for precipitation, displace the gold in the chemical sense of that term, but withdraws it from the combination hy the electrical effect of bringing the two metals—zinc in a certain condition and gold in solution—ioto contact. Yet the cyanogeo dissolves a portion of the zinc filter, forming a double cyanide of zinc and potassium. It is evident, therefore, that potassium is the ruling element of the solutlon, and it being intensely positive, we are warranted in concluding that the solution is of a positive character and will "seek out the most negative metals, and unite with them by preference."

What is wanted is a proeess that, "in practice," will extract the gold and silver from the ore, whether it accords with the theories of the old chemists and their followers or not. There have heen so many failures in mining under the charge of Freyherg and other scientific graduates that "practical men" are in demand, and that class, when the opportunity presents, will pick up enough modern chemical knowledge to qualify them to handle such questions as have arisen in using the cyanide process hetter than professionals whose heads are crammed with fossil theories and precedeots. I am not interested pecuniarily in that process (hut have a hetter one to introduce presently), yet I can see great merit in it, and consider it my privilege, if not my duty, to contribute what I can to the successful subjugation of the ohdurate sulphuret. The failures that have occurred in working ores hy cyanide are easily explained when investigated hy "practical" chemists. That at the Gold Blossom mine, in Placer county, as described to me hy persoos present during treatment, resulted from using too much cyanide, and from the presence of zinc in the ore, which, heing taken into solution along with that dissolved from the filter, charged the solution so heavily with zinc that it was incapable of acting energetically on the next trial. The gentleman principally interested is enthusiastic in favor of cyanide as a solvent, aod finds fault principally with the zinc precipitant. It is had and will he remedied as soon as circumstances will permit, hut not hy those who do nothing without "warrant" derived from the works of the old chemists. The fnture of successful mining, I venture to prophesy, will be conducted by practical men who stody the electrochemical relations existing between the useful metals and their solvents, with special reference to practical success. M. T.

Experiments with the New Process.

REDDING, SHASTA CO., CAL., Aug. 24, 1892.

TO THE EDITOR:—As cyanide items are now in order, I will give you the result of a few limited experiments:

The ore was put through a 60-mesh screen, and carried three ounces gold to two ounces silver; it also contained two and three-tenths per cent of copper sulphide, two per cent zinc sulphide, antimony undetermined, and iron sulphide. The sulphides were prohahly 45 per cent of the whole, while the gangue was a clean, white quartz. Ten pounds of the ore was put into a crock having a false hottom and the liquid made to circulate from the bottom up through the pulp. Three-quarters of one per cent solution was used for 24 hours; less than 20 per cent of the gold went into solution. A two per cent solution for the same time gave 35 per cent in solution. A ten per cent solution gave 40 per cent. I next put a carhon one-half inch thick into the hotton of the jar and suspended another in the top; these presented two square feet of surface each. A current was made to pass through the hottom carbon, using it and the pulp as the anode and the suspended one as a cathode. The current from the dynamo was a pressure of ten volts and a total output of 400 volts. In two hours less than one per cent of gold remained in the pulp, while the carhon cathode contained the metals which went into solution. With large quantities of ore, if the electric method—which keeps the solution clean and prevents polorization and thus facilitates rapid decomposition without rendering the solution normal hy the addition of copper and zinc—gives anything like approximate results, I think a great advance has heen made on the present crude methods.

GEO. A. FITCH.

Pirn Mining District.

PIRU MINING DISTRICT,
VENTURA CO., CAL., Sept. 10, 1892.

TO THE EDITOR: While writing you in regard to renewing my subscription to the MINING AND SCIENTIFIC PRESS, I may say that I consider it the hest paper a miner can take if he wants to keep posted on the many great improvements in the mining and milling of ores, and in all of the other great inventions of the age. I think I have heen one of your subscribers for over 20 years and I have heen well satisfied with your paper. One thing I like ahout it is its good, sound, moral sense in its editorials.

But this district is what I started to write about. There is very little known or said ahout Piru minlng district, and as a general thing, those who talk the most about it know the least. There are very few mining men in the district, and there never has heen a haker's dozen in the last six years I have been living here. As to genuine practical and scientific experts I have not had the good fortune of meeting one in the district. It makes an old miner laugh (who has heen at the business for 35 or 40 years) to hear some of the would-be experts explain the different formations. Several of them used to he, during the boom times in Los Angeles city, curbstone real estate agents. When the boom busted they were also husted, and hence now we have them for mlning experts.

But notwithstanding all the great strikes we read of being made in Arizona, Colorado and other places, there have been over 60 mining locations recorded here since January 1, 1892. The Haylock Brothers, G. T. Read and A. J. Hazlett have built a wagon-road from Cuddy's ranch up four miles on the west slope of the Frazier mountain to the Fair View mining claim, White Mule mine and Bunker Hill mine. Hazlett and Harhell are putting up a five-stamp quartz mill on the White Mule mine. They have part of the machinery on the ground and expect the rest to he hauled up next week. Over at the Frazier mine, five miles east of the Fair View claim, they have just put up a ten-stamp mill and are running 12 hours per day, water being scarce. Spence & Bicknell and others, owners of the First National Bank of Los Angeles are the present owners of the Frazier mine. This mine has heen worked off and on for years, this last mill being the third erected. On that claim, that there have been thousands of dollars taken out is beyond doubt. That there have been thousands spent foolishly is also true. This mine has very rich ore in it.

The Stella Gold Mine.

BANNING, CAL., Sept. 2, 1892.

TO THE EDITOR:—Taking courage from your kind invitation to subscribers to occasionally send descriptions of valuable and interesting claims, I send the following unscientific account of "The Stella Gold Mine," receotly located in San Diego county, on the north slde of Pleasant valley, 25 miles north of Indio, on the S. P. R. R.

The outcroppings run directly up and down the north side of the hill on which the claim is located, heing about 17 feet hroad at the surface of the ground and widening to a width of at least 20 feet at a depth of 20 feet, where a crosscut tunnel has been driven. The ore is an ash-colored porphyry, easily crushed, and full of small cubes of oxide of iron in which the gold in coarse grains can here and there he seen. The ore is low grade, hut perfectly free-milling, apparently; $15 in an assay value of $17.83 per ton heing extracted hy the use of a small, iron, hand-arrastre. The points of interest are the favorable character of the ore and more especially the immense deposit of it, as it can he quarried rather than mined. There is cedar fuel within five miles and pasture of the hest at hand all the year rouod. Water will have to he procured by diggiog or horing, or else piped several miles. There is surface water sufficient for camp use. The owners would like to show this property to practical miners seeking investment, not to sell, hut in hopes of receiving aid in procuring water and machinery in return for an interest, hut we do not want to handle a dollar until it comes as profit from the mine. Would he glad to meet (with a wagon) at Indlo any one feeling interested, and would take good care of them.

JOS. J. KNOX.

No More Cyanide at Present.

TO THE EDITOR:—The article of M. T. on "More Cyanide" (advaoce proof of which I have seen) is *unanswerable*. It does not "irritate" me, hut it does amuse me immeosely. Is the MINING AND SCIENTIFIC PRESS becoming a comic paper?

I am flattered by the category in which M. T. places me, for, while I know that even the great chemists make mistakes occasiooally, yet I am content to he a "follower" until I know that they have done so. I know of one point at least in which even Fresenius is "off." Seriously, I think well of potassium cyanide for extracting gold, and hope some one, whether practical or not, will soon find a better way of collecting the metal from the solution, and let us use it on more reasonable terms than those demanded hy the MacArthur-Forrest folk. C. H. A.

Personals.

J. T. GOULD, the well-known miner of Dutch Flat, is in the city.

FOREMAN RAY of the Providence mine, Nevada county, has resigned to go to Ecuador, aod John McLaughlin takes his place.

E. C. PAXTON is superintendent and part owner in the Potter mine at Jordan Hill, Butte Co. W. T. Coleman owns an interest in this claim.

SAMUEL BAGLEY, who has heen prospecting for some time on the El Dorado Summit, in Weaver district, A. T., has struck a fine ledge of silver ore.

JOHN BARRY has nearly all his mill machinery moved from Cerbat, Arizona, to the Minnesota mine, where a concentrating plant will he in full operation shortly.

MR. GILSON of San Francisco, a prominent mining man, owner of the Signal mine in Mohave county, A. T., and the Minas Prieta in Sonora, Mexico, has gone to the White Hills, Arizona.

WM. SKERM, an experienced Comstock miner, has taken charge of the Ontario and Daly mines, Utah, as general foreman or assistant superintendent, and in future will have charge of the working of those properties.

LOUIS JANIN, the mining engineer, has moved into offices in the Crocker huilding, hut Mr. Ross E. Browne still retains the rooms on Sansome street, which have heen occupied jointly for some time hy these gentlemen.

J. J. BURT of Tres Pinos, San Benito county, is in the city negotiating for improved rolling stock of the James single-track railroad, of which he has 12 miles running successfully to and from his lime works, in the Gavilan mountains.

J W. AKERS of Santa Fe, New Mexico, and Mr. McLaughlin, manager of the copper plant at San Pedro, New Mexico, and superintendent of the Lincoln Lucky mine at that place, have returned to Kingman from White Hills and Gold Basin.

CHAS. E. UREN has gone to the Lone Star mine in Gold valley, Sierra county. The ledge, for which they were running was reached. It is three and one-half feet wide, and shows free gold. This mine is owned hy Grass Valley parties, and they are now investigating the strike.

JOHN SEVENOAKS, an agent for R. C. Chambers of Salt Lake, has contracted for the purchase of the Gold Eagle claim in Ferguson district, Nev., owned by George Petty and China Dick, for $6000. This claim is situated some distance south of the April Fool mine, and recently showed up well.

WM. G. RAYMOND, a civil engineer in this city, formerly connected with the State University, and of late a member of the firm of Raymond & Bay, has been appointed to and has accepted the chair of Geodesy, Road Engineer and Topographical Drawing in the Rensselaer Polytechnic Institute at Troy, N. Y.

WM. MAYGER is superintendent of the St. Louis M. & M. Co., Montana. He has brought suit against the Montana Company (limited) in the United States Circuit Court for $500,000 It is claimed that the Montana Co. has, ever since last October, been taking ore from lodes on the St. Louis claim, through the shafts of the Drum Lummon, which adjoins the St. Louis.

Wide or Narrow Tires.

Our readers will be interested to see a statement on this mooted subject which the famous wagon-huilder, Clem. Studehaker, writes for the *Breeders' Gazette:* There can be no doubt that the general adoption of wide tires would work less harm to poor roads than would narrow tires. Broad tires for wagons, of any width that would be practical, would not, in my opinion, make good roads. They would simply have less tendency to cut up poor roads than would the narrow tire. The harm to wagon roads commonly occurs when the surface is saturated with rain and the roadbed is soft and yielding. At such times loaded vehicles fitted with wheels with narrow tires cut out ruts in the roadway more or less deep, according to the length of the wet spell and the frequency of the passage of such vehicles. When, however, the roadhed is solid and care is taken to promptly fill up inequalities which may he created hy reason of the wear and tear of the surface, in such event narrow tires are, to all intents and purposes, no disadvantage to the roadhed, while they are unquestionably of greater advantage to the vehicle. Narrow tires tend to lighter draft in drawing loads over smooth roads and over soft roads. Over surfaces that are sandy or merely yielding in their nature the wide-tire wagons give the hest results. The wide-tire wagons are accordingly better for general field use. We have, hy the aid of a dynamometer, made a series of exhaustive experiments with the wide and narrow-tire wagons, and the result of these experimeots justifies the statement contained in the foregoing Concerning the disposition of manufacturers toward the construction of vehicles with wide tires, I may say that we are prepared to manufacture these wagons in accordance with the demands of the market. It is oevertheless true that the supply of timber for fellies for wide-tire wagons is less abundant than that which is suitable for narrow tires. On this account wide-tire wagons are more expensive than those which have the usual tire, and in case of a greatly increased demand for them, the timber supply of this nature already heing somewhat scarce, the tendeocy will be to still higher prices for wide-tire wagons.

The World's Fair Buildings and Grounds.

As in ancient times all roads led to Rome, so in present days all fairs point to the great Exposition at Chicago. Naturally the best which the local fairs bring to light will be gathered in to honor the greater occasion. This fact is giving increased interest to our district and State displays.

A beautiful and suitable site was selected for the exposition, containing fully one thousand acres, charmingly situated on the shore of Lake Michigan. Jackson Park, in the southern section of the city, was selected as the site for the main exposition; the Lake Front, near the heart of the city for part of it, and the Midway Plaisance and Washington Park adjoining Jackson Park for other parts. Upon these parks there had already been expended nearly $4 000,000 in improvements prior to their being selected as the exposition site.

In the winter of 1891 the portion of Jackson Park to be used for the fair was a soft, marshy ground, shelving in irregular stretches to the water line. Now it is a firm level, a smooth, sandy surface upon a clay subsoil. It is now a level surface to the line of the lake, a surface a mile and a half in length and, at its southern extremity, nearly a mile in width.

As shown in the view upon this page, the available water has been grandly used in the design of the grounds. There is a large lagoon enclosing an island upon which some native trees are retained, while all other space has been fully planted by the horticultural department. The introduction of this island affords a natural scene in refreshing relief to the grandeur of the buildings, and, through its sylvan qualities, to the crowded and busy aspect that must be looked for almost everywhere else within the grounds.

In the picture a canal is seen to extend southward along the main building, and into a large water basin which is to form the center of a great square about which the principal buildings of the Exposition are grouped. Fountains will be in operation in this basin, forming a brilliant spectacle in the sunlight, or when illumined by colored incandescent lamps at night. The banks of these land-locked bodies of water are to be finished in a manner appropriate to the various localities through which they pass. The borders of the canal and the basin in the court will have embankments of stone or brick, surmounted by parapets or balustrades of stone, iron, brick or terra-cotta, and opening upon steps and landings, for the use of boating parties. In fact, much of the travel from building to building will be by means of passenger boats upon these waters. This facility of movement will be grateful when the visitor finds extreme objects of interest over a mile apart.

Many of the buildings shown in the view have already been separately illustrated and described in our columns. The lines under the engraving will serve to locate leading structures. One of the most interesting features perhaps is the pier shown in the foreground, which has been constructed 1000 feet into Lake Michigan. The floor of this pier slopes gently from the shore, so that visitors who arrive by water may get an unobstructed view of the court and its surroundings, the paved beach covered with people, and the architectural grandeur of the most imposing and important buildings of the Fair.

Although the California building is not shown in the engraving, its location is designated. The other buildings not named are those erected by different States and foreign governments.

Every effort will be made for the accommodation and comfort of visitors. All walks and outdoor places for assemblages of people will be furnished with numerous seats and resting places, and will be paved with mosaics of brick, stone or concrete blocks, except where gravel or stone chips may seem more expedient. The grounds will, of course, be highly ornamented with shrubs, trees, turf and flowers, most of which have been planted.

A Government Sugar Station in California.

Much interest pertains to an enterprise which will be entered upon in this State through the zeal and persistence of Hon. A. Caminetti of Amador county, who made a good record for activity and accomplishment during his first session as a California member of the House of Representatives. Though he had greater undertakings on hand, Mr. Caminetti was possessed with a deep conviction that California should make systematic experiments with cane sugar production. The result of his effort was an appropriation of $20,000 for the first year, with which will be established three stations specifically devoted to experiments with cane sugar, one in Florida, another in Kansas and a third in California. To show the aims and purposes of this measure as applied to California, we make the following extract from a speech made by Mr. Caminetti near the close of the last session of Congress and published in the *Congressional Record:*

In support of the provision of the bill now under consideration, placing it in the discretion of the Secretary of Agriculture to make experiments in the planting of sugar cane, and the production of sugar therefrom, on the reclaimed swamp lands of either the Sacramento or San Joaquin valley, in California, I desire to submit the reasons that prompted me to offer the suggestion in the Committee on Agriculture.

While considering the financial necessities of the Department of Agriculture for the next fiscal year, the item appropriating money to continue experiments for existing sugar stations was carefully examined.

It appeared at the hearing thereon that at least one station would be discontinued at the end of this year, the object of its location having been accomplished. It further appeared that at the station in Florida remarkable success was obtained in both quality and quantity of production. While Prof. Wiley was stating the probable cause thereof, the fact developed that the experiments had been made on reclaimed swamp lands of a like character with thousands of acres situated in the valleys mentioned.

This induced me to enter them for the coming vacancy.

I rely upon the qualities of our soil and existing favorable conditions to justify the action of the committee. I have investigated the climatic characteristics of Florida, and find many points of resemblance with those of California. This accounts for the success both have attained in the cultivation of citrus and other fruits.

I quote a few extracts from a report on the Florida sugar fields:

"It was altogether beyond belief at first, that any one should be wild enough to talk of turning the Florida sand into cane juice. But the rumor came from many quarters, and at length, after an interval of a year or two, came the report that sugar had actually been raised in Florida. The objection I sometimes heard urged, that occasional frosts would injure the cane, was of no moment; for sugar has long been profitably raised in Louisiana, where they not only have heavy frosts, but have also thick ice, and sometimes snow."

This offers our people encouragement, as it tends to demonstrate that success awaits its cultivation in California.

The beet-root sugar industry is an established fact with us already; and there is no doubt in my mind that the experiment to be inaugurated will fare equally well.

The policy of the Government in granting a liberal bounty to the sugar-producer commits us to proper effort in hastening the time when the home market may be entirely supplied from our own plantations.

In furtherance of which purpose science and skill should be directed toward the discovery of methods to cheapen the cost of cultivation and augmenting the product within the present field of operations.

As our home consumption, in addition to the domestic product, calls for large importations of foreign sugar, thus crediting other nations in our trade relations with many millions of dollars annually, it is obviously sound public policy to extend this field of research in new regions.

The success of the proposed experiment will introduce a new branch of agriculture on the Pacific coast, yielding a ready

BIRD'S-EYE VIEW OF THE WORLD'S COLUMBIAN EXPOSITION, CHICAGO.

ravenue and adding to the locality suited to its cultivation by the establishment of factories, giving employment to many people.

The station to be established will be under the direct control of the United States Department of Agriculture. Machinery already owned by the Government, and now in Louisiana, will be moved to this State for the equipment of the new station. Mr. Caminetti has had especial reference in his work to the lands of the San Joaquin and Sacramento rivers, naturally moist and rich, and of which there are vast areas which await profitable uses. Tenders have already been made of suitable tracts of thirty to forty acres each. We presume it will not be long before steps are taken to make a suitable selection and to begin the work contemplated by the appropriation.

THE Golden Fleece mine, Lake City, Colorado, is shipping its ores by express to the smelter, it being too rich to send by freight. The probability is that they have not so very much of this class of ore, for such things happen in most mining countries. From the pocket mines in Tuolumne county, this State, bunches of ore worth proportionately $100,000 a ton have been taken, but they do not find even a ton of this kind of rock. The Golden Fleece people say their ore runs from $5000 to $10,000 a ton.

THE San Francisco Cremation Company has secured an acre lot in the Cypress Lawn Cemetery tract in San Mateo county, and upon that will be erected buildings to cost $25,000. The company has decided to adopt the Snyder system of cremation, now in successful use at Hamburg and New York.

Mechanical Progress.

Iron Bridges.

The questioo of what to do with iron bridges is becoming more and more important every year. It is now about 50 years since railway building commenced in earnest on this continent and abroad, and within the half-century, every civilized country has been covered with a network of iron tracks Of course, the construction of railways has involved the spanning of many thousands of roads, brooks and ravioes with bridges, which were at first of wood and iron. The wooden bridges, where tbey have not been already burned away, or replaced with fireproof material, are, as a rule, still serviceable, if they were properly designed in the first instance; but the older iron bridges have fallen into a state not exactly of decrepitude, but, we might say, of diminished vital power, which gives much reason for anxiety.

The first type of iron bridge for wide spans was the suspension bridge, aod so many of the early suspension bridges have failed, through the corrosion and disintegration of their important members, as to lead the French engineers to the opinion that 40 years is the limit of life for iroo suspension bridges, and that, in computing the cost of railway construction and management, provision should be made for replacing them entirely at the end of that time. Whether any similar limit should be set to the life of iron-girder bridges is not certain. Many such bridges have failed through decay; but whether decay in a girder bridge can be easily detected, and the weakened members economically replaced or repaired, is a problem not yet solved.

One thing seems to be agreed upon, that the tests ordinarily applied to old bridges suspected of serious corrosion are far from being adequate. The common method of testing is to run a train of locomotives on the suspected bridge, and if it resists the strain due to this load it is presumed to be capable of supporting safely the effect of ordinary traffic. But experience shows that bridges thus tested have failed soon afterward under moderate strains, and it is now recognized that the simple passage of a string of locomotives over a bridge shows little about the strength of the lateral bracing, the floor members or many other essential portions the failure of which under the passage of a train will destroy a bridge with nearly as much certainty as the bending of a girder under a mere vertical strain. No doubt the weakness of these members can also be detected by appropriate tests, but a thorough test of an old iron bridge, covered with rust and many coats of paint, is a difficult matter, and the time is to be anxiously looked for wben all railway bridges wil be of masonry, which ought to last for many centuries, if properly designed. —American Architect.

Improvement in Mining Methods.

At a recent meetiog of the North of England Institute of Mining and Mechanical Engineers, presidenl J. B. Simpson, in an address oo improvement in mining methods, said that a great item in the cost of working coal was that of its conveyance from the face to the shaft. In the majority of collieries this consisted of three distinct operations: (1) Conveyance from the face to the point where the main borse roads or self-acting inclined planes end; (2) from the station to which the hand or pony putters had conveyed it, and the hauling thence by horses or self-acting inclined planes to the engine plane landing; and (3) from the termination of the last haulage to the shaft by means of engine planes. Summarizing the cost of these three different haulages, be gave it as 5d per ton per mile. He feared he could not suggest in what way this could be cheapened; how far the application of electricity might affect any portion of the cost they had not had sufficient experience to judge, but no doubt ere long electricians would assist them in the conveyance of mineral underground both in economy and efficiency. The question of the transmission of power underground for the various purposes of pumping, hauling, coal-cutting, etc., had of late occupied a foremost place, and recent papers had enabled them to see the great strides which the application of electricity was making. Compressed air for deep and fiery mines possessed great advantages, but its coefficient of useful effect, being only about 30 to 40 per cent, and its heavy cost, militated against its general use. Steam conveyed down shafts was common, but was seldom applied for long distances. The question was of such importance that he would venture to suggest tbe appointment of a committee to investigate the chief systems (1) by steam, (2) by ropes, (3) by compressed air, (4) by electricity, (5) by petroleum and gas engines, and by other means. The substitution of machinery for the labor in hewiog coal, although introduced many years ago, did not seem to have made much progress, but no doubt they might look forward to the lesseoing and cheapeoing of labor in drilling holes in coal and stone being possible when a general system of electrical transmission of power is adopted. The great quantity of coal consumed in the production of steam for the working of the mines was a serious question; he estimates that about five per cent of the total output was used in this way. In the defense it must be said, however, that inferior and small coal was frequently used. In colliery engines they had not made such marked progress as other braoches of industry, where coal had to be purchased aud more economy practiced. To insure great economy, however, required io the first place a greater expenditure in the machinery put up. In mechaoical screening great improvements had been made.

THE CROTON AQUEDUCT SYSTEM.—Although something like $25,000 000 bave beeo expended already on the New York water system, including about $15,000,000 for a new aqueduct to provide adequately for the future wants of the city, a new dam in the valley of the Croton river is necessary, which will cost in the neighborhood of $4,150,000. So far as the Aqueduct Commissioners know, this is by a large figure the greatest sum ever proposed to be expended in a dam for aqueduct purposes, at least in this country. Contractors were invited to submit bids, and the enormity of the work, the large amount of bonds required, and the great capital necessary to carry it on, limited the number of bidders. Only six firms made propositions, and the sums they offered to do the work for varied in round numbers from $3,500,000 to $5 566,000. The contract was awarded to ex-Commissioner of Street-Cleaning J. S. Coleman at his figure of $4,140,573. Engineers the world over will watch the construction of this dam with lively interest. Some difficult problems are to be solved. An enormous watershed is to be controlled by it. It is to be furnished really as a reservoir, wherein are to be dammed up the entire weters of the Croton watershed; containiog thousands of millions of gallons, and from it are to be drawn such supplies as the present aqueduct does not furnish.—Iron Age.

TO DRAW COKE BY MACHINERY.—The H. C. Frick Coke Company is having a mechanical coke drawer made on a new plan. The machine will be from 8 to 12 feet long and made of cast iron. A narrow gauge track will be built along the yards about three feet from the coke-oven fronts. Along this track the patent coke drawer will be run. Two men will be required to operate it. The coke will be watered by hand, as at present. Two scrapers, similar to the ordinary short and long coke scrapers io use, will be swung from the machine on a crane. These two scrapers will be manipulated by the men with the machine. The coke will be booked down and scraped from the oven in mucb the same manner as by hand. Running from the iron coke drawer to the car on the track will be a long sheet iron scoop. The coke will be drawn directly from the oven into the car. This scoop, if satisfactory, will be the means of doing away with the enormous wheelbarrow and steep platform over the cars. If successful, the new drawer will draw an oven in one-third the time now required. A test will be made at the valley works.—American Manufacturer.

THE new underground conduit for electric railways has now been employed in the operation of one of Chicago's streetcar lines for a number of mnnths, and during that time many experiments have been made with a view to secure the best trolley to meet all requirements of the situation. In one method which seems practical the wheels are smaller than the overhead trolley wheels usually are and the grooves are shallower. A nearly universal movement is given to the wheels by especially contrived swivel bearings. When it is desired to have the cars run backward as well as forward, another set of springs are attached to the device. Contacts are made with bare conductors, and in operating the trolley the motorman brings it up or down according as he desires to make or break connection with the current.

SOME tinsmiths use leaden-headed nails for roofing purposes. The last strokes flatten the head over the hole made in tbe tin, and leaking is thus prevented.

Scientific Progress.

Artificial Precious Stones.

What promises to be a most important discovery has been made by one of our Glasgow scientists. Although imitation gems are obtaioable in any required quantity, the production of crystals having the hardness, durability, and other qualities, both physical and cbemical, of natural stones has been one of the unsolved problems of applied chemistry. The most advanced efforts up till now have beeo made in Paris, and the Freoch specialists have at least proved the possibility of producing sapphires, rubies and other stooes by artificial means, tbeir products being real gems, and not glasses. It is doubtful, however, if the originators of the French methods themselves claim that theirs are tbe methods of nature, and it is reasonable to suppose that the most natural method will be tbe most practically successful one. Although no geologist or chemist can declare the new process to be the process of nature, yet many analogies point that way.

Experimenters in tbis field may have beeo partly discouraged by the thought that the gems of nature were produced under conditions of enormous pressure, to which might have beeo added very high temperatures, and that they were in some cases the products of long periods of time. It is possible, however that too much weight has been given to this point. In the process now under notice no such discouraging conditions are present, and the method is wonderfully simple. Even working on the laboratory scale, using small vessels, stones have been obtaioed over one-sixteenth of an inch in diameter, and very large numbers have been formed approaching that size. There is no reason to doubt that working on a larger scale will yield stones of any size likely to be required. The noble nature of the products is beyond doubt, as they are very hard, infusible at all ordinarily attainable temperatures, and insoluble in any acid. The bulk of the gems are white or rather colorless sapphires. They are compact and transparent crystals, and many specimens have a splendid luster. By subsequent treatment some of them have taken on the sapphire blue.

Some of tbe specimens seem to contain a small amount of carbon. This element is sometimes present in small quantity in natural emeralds, a fact not generally stated in bnoks on the subject. In a few specimens the proportion of carbon seems to be considerable, and there are present individual crystals having physical properties more nearly allied to the diamond than to the sapphire. In nature diamonds are often found associated with other gems. In any case the products contain little or no silica, this compound being the characteristic ingredient of all kinds of glass. Apart from the possibilities of the process in the direction of producing the diamond, the chief point already established is that of having found an easy method of crystalliziog alumina. The Oriental ruby, Oriental amethyst, and other gems coming under the heading "Oriental," are all of them only variously colored sapphires, and alumina forms the chief constituent of the series.

There is little doubt that the process will yield the ruby and other varieties. Apart from ornamentation, their hardness will fit them for mechanical purposes, and their cutting power is remarkable, perhaps due to the small amount of carbon already spoken of. The author of the process has sought the opinion of several of the foremost men of science, and their general verdict has been very favorable. The discovery may prove to be one of the most important yet made in mineralogical chemistry, and the future developments botb commercially and scientifically difficult to estimate. The originator of the process is Mr. James Morris.—Glasgow Herald.

The Problems of Commercial Electrolysis.

Altbougb one of the earliest principles of electric action applied to commercial purposes, electrolysis bas, until a comparatively recent period, been confined to but a few fields of usefulness, and, with one or two exceptions, even these have been very limited in actual commercial product turned out. That there has been no lack of experimental investigations in this domain will become apparent upon even a cursory examination of the literature on the subject, whicb dates back over a hundred years. Of late, however, renewed interest is beiog manifested in electrolytic work, and in a variety of branches. Some of these bave already been cultivated to some extent, and others invnlve original processes. In a review of the problems of commercial electrolysis, submitted io a paper read before the London Institution of Electrical Engioeers, Mr. James Swinburne has outlined briefly the salient features of the most prominent electrolytic appliances of the day, both actual and proposed, and has made some suggestive remarks touching their probable future. Passing over the methods whose success is already well established, Mr. Swinburne, taking a broad view, asks: "Which of the oxidizing and reducing processes in use in chemical works can we advantageously replace by electrical methods?" He answers this questioo by stating, that "in many cases electrical methods are impossible; in others they are more expensive than those at present in use; but it is hardly too mucb to say that in an enormous number electrolysis is destined to play a leading part in the near future." Among the products included in the latter class, Mr. Swinburne mentions oxygen, which, he calculates, can be produced for less than one-tenth the selling price of the chemically prepared gas. In the production of caustic soda and its accompanyiog by-product, bleaching powder, Mr. Swinburne figures a large margin of profit by the use of the electric current; but he draws attention to the difficulty thus far invariably encountered in the gradual destruction of the positive electrodes, even carbon succumbing to the corroding action of the current, while platinum, though not entirely free from attack by chlorine, is too expeosive. Mr. Swinburne also draws attention to the fact that much has still to be done in the production of aluminum, magnesium and the refining of the precious metals directly from the ores; the recovery of tin from scrap iron, the production of ozone, electric tanning, etc. The field here open to practical commercial results is indeed without limit. The refining of copper alone is well worthy all the effort aod time that can be bestowed upon it, but by no means represents all tbat holds out promise of success. It may be well, however, to point out to beginners in electrolytic work that pitfalls may await them, and that a thorough study of the literature of the subject may forestall discouraging experiences.

ZINCS FOR GRAVITY BATTERIES.—One of the most valuable improvements made of late in gravity batteries is that by Mr. Georges d'Infreville, formerly electrician to the Western Union Telegraph Company. He has taken the old crowfoot zinc and so transformed it by his inventive genius that he may be said to have given a new and long lease of life to that familiar servitor of the telegraph. The economy that he proposes to effect is by no means insignificant. It is understood that the Western Union uses about 750,000 zincs every year, and if we allow but as many more for all the other telegraph systems and appliances of the country, including the Postal, the railway companies, the district messenger and other users, we find a consumption of about 1.500,000 zincs per annum. With Mr. d'Infreville's simple, beautiful and highly ingenious movements, the coosumption can be greatly reduced, the waste abolished and the service materially bettered. We must confess our admiration of the inventive faculty that can thus see in the most familiar and commonplace objects a large opportunity for its employment, and we trust that Mr. d'Infervlle will enjoy some return for the work and study by whicb tbrough, several years of steady experiment, he has brought his devices to perfection. His initial modification of the zinc bas brought with it a number of corresponding changes throughout the gravity cell, each requiring careful adjustment and each yielding its better result in a wider application of this type of battery.—Electrical Engineer.

AN ELECTRIC MINE RECORDER.—Ooe of the latest applications of electricity to mining operations is seen in the Metternicb lead mine in Belgium. Each bucket that arrives at the top of the shaft makes an electric contact, and a needle in the office indicates by a red line upon a revolving drum the number of buckets brougbt up. By this arrangement, it is possible to keep an accurate record of the regularity of the work, wbile the register prevents any disputes as to the quantity of material taken out of the mine.

ELECTRIC-LIGHTING has been abandoned on the Midland Railway of England after several years' partial use of it as being too expensive or unreliable, or both, for its use, and the company has adopted instead the Pintsch compressed oil-gas system as its standard method of illuminating passenger coacbes. It bas already erected tbree gas plants at various points along its line, and has ordered equipment for 886 cars.

A Great Repository of Practical and Scientific Information.

One of the Fullest, Freshest and Most Valuable Handbooks of the Age. Indispensable to Every Practical Man.

Price $2.00.

Free of postage to any address in the world.

THE TECHNO-CHEMICAL RECEIPT BOOK:

Containing Several Thousand Receipts, covering the Latest, most Important, and most Useful Discoveries in Chemical Technology, and their Practical Application in the Arts and the Industries. Edited chiefly from the German of Drs. Winckler, Elsner, Heintze, Mierzinski, Jacobsen, Koller, and Heinzerling, with additions by Wm. T. Brannt, Graduate of the Royal Agricultural College of Eldena, Prussia, and Wm H. Wahl, Ph. D, (Heidl.), Secretary of the Franklin Institute, Philadelphia, author of "Galvanoplastic Manipulations." Illustrated by 76 engravings, one volume, over 500 pages, 12mo, elegantly bound in scarlet cloth, gilt, closely printed, containing an immense amount and a great variety of matter.

Price $2.00, free of postage to any address in the world.

☞ *A circular of 32 pages, showing the full Table of Contents of this Important Book, sent by mail free of postage to any one in any part of the World who will furnish his address.*

"Transmission of Power by Manilla Rope" Copiously illustrated and described in catalogue just issued.

The Best Mining District

On the Pacific Coast!

GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is

THE TIDINGS.

Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.

Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.

DAILY, $6.00 a year; WEEKLY, $2.50, *in advance.*

H. S. SPAULDING, Publisher

T. C. HOCKING, Editor.

AMALGAMATING MACHINERY.

Stamp Mills for Wet or Dry Crushing. Huntington Centrifugal Quartz Mill. Drying Cylinders. Amalgamating Pans, Settlers, Agitators and Concentrators. Retorts, Bullion and Ingot Moulds, Conveyors, Elevators, Bruckners and Howell's Improved White's Roasting Furnaces, Etc.

FRASER & CHALMERS,

MINING MACHINERY

CONCENTRATING MACHINERY.

Blake, Dodge and Comet Crushers, Cornish Crushing and Finishing Rolls, Hartz Plunger and Collom Jigs. Frue Vanner & Embrey Concentrators, Evans', Calumet, Collom's and Rittenger's Slime Tables. Trommels, Wire Cloth and Punched Plates. Ore Sample Grinders and Heberle Mills.

IMPROVED CORLISS AND SLIDE VALVE STEAM ENGINES. ❋ BOILERS HORIZONTAL, VERTICAL ... AND SECTIONAL....

IMPROVED STEAM STAMPS

Hoisting Engines, Safety Cages, Safety Hooks,

Ore Cars, Water & Ore Buckets,

Air Compressors Rock Drills, Etc.

General Mill and Mining Supplies, Etc.

Sectional Machinery for Mule-Back Transportation.

Pumping Engines and Cornish Pumping Machinery,

Improved Water Jacket

Blast Furnaces for Galena & Copper Ores,

Slag Cars and Pots,

Roots & Baker Pressure Blowers,

Suspended Tramways.

JOSHUA HENDY MACHINE WORKS,

NO. 51 FREMONT STREET, SAN FRANCISCO, CAL.

BUILDERS OF

"Sensible" Horse-Power Hoisting Whims.

(DAVIS PATENT.)

PRICES REDUCED.

The "Sensible" Hoist is the cheapest and beyond doubt the best in the market. It is built entirely of iron and steel, mounted on a heavy iron base plate, and is therefore very durable and not affected by exposure to climatic influences.

The bevel gear on the drum shaft is loose, and, in hoisting, drives the drum through a friction clutch. This avoids the frequent accidents occurring with other Whims, occasioned by the breaking of the gear teeth when throwing them out of gear. In lowering, the drum is pressed by a powerful screw lever against brake woods at the opposite end. Perfect means of adjustment are provided for the friction clutch and brake blocks.

As the drum is entirely independent from the driving gears the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases the capacity of the machine by avoiding the loss of time due to stopping and starting the horse.

It is very light and compact and very easily taken to pieces for transportation by mules. The cost of erection is very small, two men in half a day being able to put it in place ready for work.

Weight of hoist, 1200 lbs. Total shipping weight, including sweep, levers and sheaves, 1400 lbs.

Circulars giving Capacities and Prices furnished on application.

TUBBS CORDAGE CO.

(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal.

THE RUSSELL PROCESS.

THE RUSSELL PROCESS CO.,

Park City, Utah.

RUPTURE, PILES and all Rectal Diseases POSITIVELY CURED, in from 30 to 60 days, WITHOUT OPERATION OR DETENTION FROM BUSINESS. Also ALL NERVOUS, SKIN, BLOOD PRIVATE AND CHRONIC DISEASES OF BOTH SEXES. STRICTURE AND URINARY TROUBLES CURED. No charge unless cure is effected. Consultation free. Call or address for pamphlet, DRS. PORTERFIELD & LOSEY, 838 Market Street, San Francisco, Cal.

Useful Information.

Speed of Machinery at Night.

It has been very often asserted, and perhaps as often denied, by millers and others in charge of running machinery, especially machinery driven by water power, that it runs stronger at night than in the day-time. The men who have noted these differences have been and are, for the most part, simply artisans, says the *Mechanical News*, skilled in their business but unlearned in the arts and sciences in general, and therefore, without being able to explain the phenomenon, still assert with great positiveness that machinery does run faster or stronger at night than in the day-time. Those who contradict the statement lay some claim to a knowledge of the natural laws and natural science in general but nothing about the practical part of operating machinery. The one class asserts, on the strength of positive knowledge acquired hy continued experience and observation, while the other class contradicts on theory alone horn of a supposed knowledge of natural laws.

It is one of those peculiar cases where both are partly right and both partly wrong. There is perhaps no question but that machinery has heen frequently detected running stronger at night than during the day, but not necessarily so, and those observing these facts are right in the statement of the facts but wrong in the conclusion that the phenomenon is due to the fact of its being night-time. The others are wrong in contradicting the known facts hut right in the conclusion that night-time does not necessarily furnish additional strength or speed to running machinery. All motion is affected by the atmosphere and the denser it is the heavier and more sluggish the motion of machinery, or anything else that moves, and the more rarified and lighter it is the freer and apparently stronger motioo is. Not only that, but the water that propels the machinery is affected by the same causes. The lighter the atmosphere is the heavier, relatively, the water is and the greater its power for performing work. Thus, with less atmospheric resistance to motion and heavier water, the machinery necessarily runs faster with the same gate or quantity of water. Some have imagined that the heavier the atmosphere the more effective the water on account of the increased pressure on the surface of the water. That, however, is a manifest error, because the pressure of the atmosphere is equal in all directions, and the pressure above the wheel is balanced hy the pressure below it, while the increase of atmospheric pressure, which means an increase of buoyancy and density, reduces the actual weight of the water and therefore the power. This can be better understood if, in imaglnation, we we increase the density or specific gravity of the atmosphere to a point greater than that of water. The latter would thus have no power, but would float aimlessly in the atmosphere as vaporized water, or clouds, now do, or as lighter fluids or solids of a less specific gravity float on water. As an equality of density between the atmosphere and water destroys the effectiveness of the latter, so does any increase of atmospheric pressure or density affect the power of the power of the water in proportion.

When the barometer indicates the lowest pressure, then will water-driven machinery run the strongest, whether it be at day-time or night, and the condition probably occurs more frequently after the mid-hour of night than at any other time. But whether or not at that hour all nature, animate and inanimate, barring winds and storms, is silent and still and the dreamy miller or other watcher, having nothing on his hands or mind but to watch the mill, quickly notes any change that occurs in the running of the machinery—changes that would not be noticed in the busy hours of the day—are observed, and hence the reason for the belief that machinery runs faster at night than in the day-time.

THE WORLD'S CONSUMPTION OF COAL. A statistician has lately been engaged in estimating the world's consumption of coal. He divides his figures into four groups, embracing, respectively, the quantity of coal used in heating steam boilers, in the production of gas, in the extraction of metals from their ores and for household purposes. It may be taken, he says, that the total steam-engine capacity of the globe is equivalent to 10,000,000 horsepower, and that, having regard to the utilization of other fuels, the quantity of coal burnt with the object of producing steam averages 4.4 pounds per horsepower per hour, or an hourly aggregate of 12,000 tons. In all probability, however, this is an underestimate, as the efficiency of the world's steam engines is calculated hy some to be 20,000,000 horsepower. With respect to the manufacture of gas, the hourly consumption of the illuminating aeriform fluid is given as 5,000,000 cubic meters, which would necessitate the distillation of at least 10,000 tons of coal per hour. More difficult to calculate is the consumption of coal for the production of power and heating gas. It may be estimated, our authority thinks, at 4500 tons per hour. A large quantity of coal is used in the reduction of metals from their ores. It is calculated that in this way some 9000 tons of the mineral are consumed every hour. A special estimate gives the quantity burot hourly by works and factories at 5000 tons. The most difficult calculation is that of the domestic consumption of coal. It is estimated at 55,000 tons per hour, or 1,320,000 tons per day of 24 hours. This figure, however, appears rather small considering that in Great Britain and Germany alone, the daily output of coal in recent years has averaged 600,000 tons, and that the extraction in all other countries may be reckoned as one and one-half times this quantity.

THE INSIGNIFICANCE OF GRAVITATIONAL ATTRACTION.—From common experience we are apt to hold exaggerated notions of the power of gravity, says *Electricity*. Not until we compare it wlth other attractive forces, such as magnetism or electricity do we appreciate how trivial it really is. The fundamental experiments in electricity and magnetism, known to men for more than 2000 years, of lifting light bodies by rubbed amber, and iron filings hy means of a loadstone, demonstrate at once their incomparably greater power. If, for instance, the attracting body had the moderate dimensions of a hand-specimen of amber or loadstone, we should require it to be of so dense a material as to weigh 1,000,000,000 pounds instead of a few pounds, as usual, in order that its gravitational attraction should equal that of either of the two forces mentioned. It is obvious, therefore, that the imposing nature of the force of gravity, as equally compared with other attractive forces, is due not to its superior qualitative magnitude, hut to the enormous masses of the hodies which exercise it. Thus, while it requires the use of the most delicate torsion balance to demonstrate, even, the mutual attraction between a small and a large sphere of lead, yet where enormous masses, such as the earth, are concerned the attraction exerted by one hemisphere upon the other, probably exceeds a force of 500 pounds per square inch over a surface whose radius is 4000 miles.

THE MAGNETIZATION OF IRON IN AN ALTERNATING FIELD.—In a recent number of *Beiblatter*, Messrs. Gerosa and Finzi have published the results of investigations on this subject. The authors have previously shown that there is no turning point in the magnetization curve of iron traversed hy an alternating current, and at the same time placed in a magnetizing spiral-conveying alternate current. The maximum of magnetization is also less. The tests described in this paper were made with a Bellati dynamometer, at one end of the needle of which was fixed a magnetizing spiral (1000 per min.) containing a bundle of hard-drawn iron wire. A bundle of the same wires annealed was also tested. At the other end of the needle of the dynamometer was a compensating-spiral similar to the first, but without a core, and this was movable by a micrometer screw. The results showed no hysteresis for either hard or soft wires; the temporary moment of the annealed was the greater, and both approached the maximum of magnetization much sooner, though the actual moments were less with direct current.

THE MICROPHONE IN WARFARE.—An interesting suggestion has recently been made for the employment of microphonic apparatus, submerged in the sea, to indicate the rate at which a self-propulsive torpedo is traveling from the observer. The torpedo is so constructed as to generate in the rear intermittent, but regularly-timed, pulses or longitudinal waves in the water. These pulses may, or may not, be concerned in the propulsion of the torpedo. The microphonic apparatus shows the apparent pitch or frequency of the pulses as they are received at the starting point—a fixed point, of course, in the wake of the torpedo. This pitch will he lower as the speed of the torpedo increases, and it is claimed that, making due allowance for ocean currents, this system enables the path traversed by a self-propulsive torpedo to be traced out, by a continuous record of the speed at which it is moving, in a manner hitherto impossible. If we suppose that electro-motive power is conveyed to the torpedo through a wire cable, that is paid out to it as it proceeds upon its journey, then the conditions for isochronising the pulsations generated at the torpedo with those of a standard vibrator will he most favorable; and if the torpedo strike a net or other obstruction, this will at once he indicated by an apparent quickening of the pulsations, and the motive power can be regulated accordingly.

THE BALLOON IN WAR.—A series of interesting experiments was conducted the other night at Stanford Bridge grounds, London, with balloon and apparatus invented and improved by Mr. Eric Bruce for use in military signaling at night over intervening woods and hills, says the London *News*. Within the balloon are hung on a small swinging ladder six incandescent lamps, connected by insulated cahle with a battery on the ground, worked that night at 24 volts and giving 60 candlepower of illumination. By ready manipulation of the buttons at the instrument, the operator flashes on the translucent sides of the balloon the signals of the Morse or any code, and these can be easily read at a distance of six miles. The balloon used was a small one of 18 feet diameter, containing 1000 feet of gas, and was held by a cahle at a height of 300 feet. The strong wind prevailing rendered the position of the balloon unsteady and uncertain, but the signals were, nevertheless, read hy military experts and answered from a station on land. The experiments were witnessed by Prince Edward of Saxe-Weimar, hy military attaches of the Chinese and other embassies, and a numher of scientific men. The experiments were varied by hanging the lamps outside below the neck of the balloon and flashing direct. The illuminated balloon, when a few feet above ground, gives a beautiful light, and can be utilized when required for executing work at night.

STAINS ON COPPER AND BRASS.—An investigation has been made by Prof. Turner of Birmingham, England, of the red stains which so often appear on copper and brass wares, and which frequently cause considerable loss by the depreciation of such articles in store. As a general thing, it has heen customary to attribute these stains and spots to burning, sulphur, furnace dust and dirt, the opinion being also that such stains pass through the whole mass. According to Prof. Turner, however, none of these views is correct, the stains being confined to the surface, and nodules are never observed. Finally, on evaporating water, salt water, pickle and dilute acids on the surface, or writing with such ingredients on the brass, he obtained stains, especially when chlorides were used, but not with zinc chloride. The conclusion is that chlorides attack the zinc and liberate the copper, hut zinc chloride cannot do this, the stains are, therefore, caused by the water being allowed to dry on the material after washing, on the completion of pickling. The hrasses themselves are found very uniform. It is remarked that, as the water of Birmingham is notahly impregnated with chlorides, this fact accounts for the excess of such trouble in that locality.—Manufacturers' Gazette.

CELLULOID.—It is said that celluloid was discovered in 1689 by Hyatt. It is prepared hy directing a jet of a mixture of five parts sulphuric acid and two parts nitric acid upon a roll of unsized paper, which is slowly unrolled by machinery to receive it. It then becomes pyroxylin, a variety of nitrocellulose. After washing, the compound is ground with camphor until thoroughly incorporated, and then dried under a hydraulic press hetween bibulous paper, again ground and compressed in a special apparatus and heated to a certain temperature, when it becomes a translucent, hard and elastic substance, capahle of high polish. When heated to 250° F. it becomes soft and malleahle, can be drawn into very thin leaves, which, being mixed with various colored substances, is made into a variety of articles. It is soluble in methyl alcohol, amyl acetate, a mixture of ether and alcohol, either ethylic or methylic, in a solution of zinc chloride, in twice its weight of hydrochloric acid, etc.

HARDENING COPPER.—Quehec scientists say that one of the most wonderful discoveries of recent years is that made hy a poor hlacksmith of that city named Ferdinand Allard. It is the long lost art, known to the pyramid builders of Egypt, of hardening copper. Axes and other edged tools made of hardened copper have been exhihited by him, which in edge and temper rival the hest steel of the present day. Allard prepared a sheet of his hardened copper one-fourth of a line in thickness and had it tested at the government rifle ranges there. At the first shot fired from 40 yards distance the bullet was shivered into a thousand fragments. On the second, the missile striking the copper more fairly, was completely flattened, but remained imbedded in the plate, which it merely dented lightly, without cracking it in any way. This is claimed by experts to be vastly superior to anything the best steel could do under like circumstances, and the matter is to he hrought under the immediate notice of the British Lords of the Admiralty. The leading military authorities in Quebec express the conviction that if, on further trials, the discovery maintains the same superiority most important results must follow and existing systems be completely revolutionized.

A NOVEL CANDLESTICK.—The make an unusual kind of candlestick insert an iron nail in the lower end of a short candle in order to make that end heavier and place the whole in a glass containing enough water to reach the upper edge of the candle without wetting the wick. As the candle hurns it grows lighter and lighter and rises gradually as it diminishes in length, so that the lighted end always remains above the surface of the water. Moreover, the outside of the candle heing cooled off will melt much more slowly than usual and the flame will make a little hollow in the center. This hollow place also helps in making the candle float and preserves the wick from the water. Thus the candle will continue to burn until the wick is consumed.

THE FEEDING OF INFANTS.—In France the Society for the Protection of Children has prevailed upon the government to enact stringent laws for the feeding of infants, making it an offense to give solid food to a child under a year old. Such food may he given, however, hy the prescription of a licensed practitioner. The use of nursing hottles with rubber tuhes is also forbidden hy law. When the tube is used it should he turned inside out after each using, thoroughly washed, rinsed and dried, then put in water containing a little baking soda. Once or twice a week the tuhes should he boiled a few minutes.

A GOOD imitation of ground glass can he made by putting a piece of putty in muslin and twisting the fabric tight into a pad; clean the glass first, then treat with the putty all over. The putty will exude sufficiently the muslin to render the stain opaque. Let it dry hard and varnish. If a pattern is required, cut it out in paper as a stencil, place it so as not to slip and proceed as above, removing the stencil when finished. If there should he any objection to the existence of the clear spaces cover it with a light opaque varnish. In this way very neat and cheap designs may he painted on glass doors.

PLATINUM vessels for concentrating acids are now made on an improved plan, the new feature heing that of coating the platinum with gold, such a coating, it is found, adding materially to the life of the vessel. The coating of the platinum sheets in this manner is accomplished hy simply heating them to a temperature higher than that of the melting point of gold, and then running the molten gold over them. The douhle sheet of the two metals can then be rolled, when it is fit for making the vessels that are required for chemical lahoratories and other purposes.

IN GERMANY, the smith, when finishing the shoe, punches a hole in the two ends, and when the shoe is cold, he taps in a screw thread and screws into the shoe when on the horse's foot, a sharp-pointed stud of an inch in length; and with shoes thus fitted, horses can travel securely over the worst possible road, and have never been known to slip, and draught horses are shod in the same way.

IT appears that a colored or dark pigment in the olfactory regions is essential to perfect smell. In cases where animals are pure white, they are usually totally devoid of hoth smell and taste; and some, the white cat, for instance, are almost invariably deaf.

THAT which is popularly known as the funny hone, just at the point of the elhow, is in reality not a bone at all, hut a nerve which lies near the surface, and which, on getting a knock or blow, causes the well-known tingling sensation in the arms and fingers.

THE points of the compass can be told from trees by the following simple observations: The side of the trees on which most of the moss is found is the north. If the tree be exposed to the sun the heaviest and longest limbs will he on the south side.

THE biggest university in the world is at Cairo, Egypt—a country which is not mentioned at all in the statistics—and it has 11,000 students.

Metallurgy and Ores.

SELBY
SMELTING and LEAD CO.,
416 Montgomery St., San Francisco
GOLD AND SILVER REFINERY
And Assay Office.

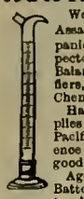
Highest Prices Paid for Gold, Silver an Lead Ores and Sulphurets.

—MANUFACTURERS OF—

BLUESTONE,
LEAD PIPE,
SHEET LEAD,
SHOT, Etc., Etc.

ALSO MANUFACTURERS OF
Standard Shot-Gun Cartridges,
Under Chamberlin Patent.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco.



We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock o Chemicals.

M.C.Co BATTERSEA

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents for the **Morgan Crucible Co.** Battersea, England. Also for **E. G. Dennistoun's** Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taker at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

Nevada Metallurgical Works.
NO. 23 STEVENSON STREET,
Near First and Market Streets, S. F.
C. A. LUCKHARDT, Manager. ESTABLISHED 1869

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, etc.
Working Tests (practical) Made.
Plans and Specifications furnished for the most suitable Process for Working Ores.
Special attention paid to Examinations of Mines; Plans and Reports furnished.

O. A. LUCKHARDT & CO.,
(Formerly Huhn & Luckhardt,
Mining Engineers and Metallurgists.

Malthine M'f'g Co.
FACTORY:
Cor. Jefferson & First Sts., Oakland, Cal,
MANUFACTURERS OF
ACID, ALKALINE AND WATER-PROOF PAINTS,
Superior to anything of the kind in the market for
IRON, WOOD AND TIN.

Unequaled for Submerged Timbers. Red and Brown Paints for Roofs, Warehouses, Stables, Fences, Etc., mixed Ready for Use. Also, Sheathing Paper, Portable California Mastic Roofing, the Best in the Market for

RANCH AND CITY,
AND UNEQUALED FOR
Teredo-Proof Pile Covering.

This Company also Manufactures a Malthine Compound for
RENDERING BOOTS AND SHOES WATERPROOF.
The same is a superior article for Preserving Harness rendering it Impervious to Moisture and keeping it always pliable and soft.

Send to Factory, Jefferson and First Streets, Oakland for Samples and Prices.

ENGRAVING—SUPERIOR WOOD AND Metal Engraving, Electrotyping and Stereotyping done at the office of this paper.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

GAS WORK A SPECIALTY.

A. S. ORANT. S. B. CONNOR.
CONNOR & GRANT,
Millwrights and Engineers
303 California St., San Francisco.
Designers, Constructors, and Contractors for the Erection and Equipment of GOLD AND SILVER MILLS, HOISTING AND PUMPING WORKS, TRAMWAYS, and everything pertaining to the Mining and Reduction of Ores.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION — JUST OUT.
Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

BY J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from ormulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Electricity.

The Rise of the Storage Battery.

A report of an extended trial of the storage battery in Milford, Mass., presents facts indicating that this ideal method of propulsion is far on the way to practical success, says the Pittsburg *Dispatch*. The drawbacks of the trolly make the subject one of undoubted interest to all cities where electric transit is required. Storage-battery cars have been in operation at Milford for 16 months. During that time there has not been a single day's failure of the line in summer or winter. Six miles of track are run over, including grades of 8½ and 10 per cent, and in all cases the power has been adequate to surmounting these grades at an even rate of speed.

The improved storage-battery car weighs less than the trolley cars used in Boston. They carry power enough to run long distances, one car having run 50 miles without recharging with a surplus of power at the end of the run. This is partially due to the fact that the action of the wheels in running down grades is used to recharge the batteries, an exact record of one trip showing that 17 per cent of the power from the batteries was returned by this method in going down hill. The storage cells are constructed of rubber in such a way that the "buckling" of plates, which was wont to disable the older style of battery, does not take place. The batteries are charged at the terminal station in a very few minutes.

Beyond the great achievements of doing away with the trolley poles and wires, the advantages are quite positive. An accident cannot bring the whole line to a sudden stop. The electric lamps in the cars are not extinguished, as in the trolley cars, when the trolley is thrown off the wire. The whizzing souod of the trolley car is asserted to be abolished. Electrical buttoos ring signals, which in other cars are sounded by bell ropes. But the great advantage of the storage-battery, if these reports are not overdrawn, will be its abolition of overhead poles and wires. That is something that should be done as soon as the practicability of the storage-battery is completely demonstrated. The poles and wires are an endurable nuisaoce so long as they are necessary to improve transit, and oo longer. If the reports from the road at Milford are not exaggerated the day is not far distant when they can be completely abolished.

ELECTRIC LOCOMOTIVES. — There are are very few installations to-day where electric locomotives drawiog passenger trains are in use, and fewer still from which the actual figures and reliable data can be obtained regarding the details of operation. For this reason the results of actual working of the Siemens electric locomotives on the underground line of the City & South Loodon railway will prove of great interest to electric-railway engineers and others interested in this method of rapid transit. The figures presented by Mr. Alexaoder Siemens show that, with these locomotives of 100-horsepower capacity, the efficiency of the motors, under widely varying conditions, was practically constant at about 92 per cent. The armature speed to secure these results was varied from what would correspond to 12 miles per hour of the locomotive to about 30 miles per hour, and the brake horsepower under these different speeds was 110 and 49-horsepower respectively. After being put into actual service, the locomotives were thoroughly tested, the average speed heing about 13 miles per hour. A study of the curves shows that each locomotive, which fully equipped weighs not far from 13½ tons, when drawing a load of 21 tons exclusive of passengers, required under ordinary running a current of not over 50 amperes, although in starting as much as 140 amperes were used. The violent fluctuations of current called for are shown as in all curves of this kind that have ever heen published, aod, as might have been expected, the fluctuations of voltage at the geoerating station are shown to he not coincident with the fluctuations at the terminals of either one of the locomotives.—Electrical World.

WROUGHT AND CAST IRON FOR DYNAMOS.—Two very important considerations influencing the construction of field-magnets are economy and mechanical strength, and in practice it is often considered advisable where the weight is unimportant to use cast iron for part or all of the field-magnet core. It is preferable to forge or cast the core in one piece, as joints break the molecular continuity and increase the magnetic resistance considerahly; this disadvantsge is minimized hy making the surfaces in contact fit truly. The principal practical objection to the use of cast iron is that, since its sectional area must be at least twice that of wrought iron, a much greater amount of copper is required to form the field-magnet coils. Copper is expensive, while cast-iron cores are far less costly than equivalent ones of wrought iron, and it is interesting to observe how different makers aim at true economy in this matter. Even leaving out the question of cost and weight, it does not by any means follow (as is sometimes supposed) that a dynamo properly designed to perform certain work, and having cast iron in its construction, is inferior to one built wholly of wrought iron to perform the same work.—Electrical Age.

Electric Power.

Only a portion of the power given electrically to a motor, says the *Electrical Age*, is converted usefully into mechanical power, a part heing spent in heating the armature, field-magnet, coils, etc. When the armature is at rest, the whole of the electrical power absorhed by the motor is so converted ioto heat, and the efficiency of the machine—that is, the ratio of the useful power obtained on the shaft to the total power supplied—is at its lowest value. When the armature is moved, the useful performance of work hegins, and as the current also falls in strength, the power wasted in heating decreases. The higher the speed of rotation the higher becomes the counter-E. M. F., and the less becomes the power wasted as heat in the conductors; in fact, the ratio of the power usefully absorbed hy the motor to the whole power supplied is very nearly proportional to the ratio of the counter-E. M. F. to the E. M. F. applied at the terminals of the machine. The efficiency of the machine is therefore highest when the load is a minimum—that is, when it is doing least work per revolution—while the torque, or the force with which the armature tends to rotate, is greatest when the load is sufficiently great to prevent the armature turning, and when, therefore, it is doing no external work at all. Now, when a motor is running at a high speed, it performs very little work indeed duriog one revolution, although, the number of revolutions heing great, a considerable amount of work may be performed during a given interval of time—say one minute. Oo the other hand, when the speed is very low, the amount of work per revolution is comparatively great, hut the small number of revolutions per minute prevents the quantity of work reaching, during that interval, a very high value. By considering these two extreme cases, it might be supposed that there is a certain intermediate speed of rotation at which the work performed hy any given motor is a maximum. This is the case, and the speed of a motor at which it can perform the maximum amount of work per minute is that speed at which the counter-electromotive force becomes equal to the electromotive force applied at the terminals. This result is quite independent of the efficiency of the conversion, which iocreases with the speed of rotation.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the Pacific Coast Borax Company will he held at the office of the Company, Room 26, No. 101 Sansome St, San Francisco, Cal, on Monday, the 19th day of September, 1892, at the hour of 1:30 o'clock, P. M., for the purpose of electing a Board of Directors to serva for the ensuing year, and the transaction of such other business as may come hefore the meeting.

ALTON H. CLOUGH, Secretary.

MINE OWNERS, ATTENTION!

A first-class millman and gold and silver amalgamator desires a situation. Has had charge of four mills, and has worked in many more. Can give best of references and recommendations from former employers Parties who are likely to want a millman would do well to correspond. Address, "E. M.," Station A.. Los Angeles. Cal.

CORRESPONDENCE SOLICITED

With parties owning high-grade tailing ponds, or rebellious ore, above ten-dollar valuation, with a view to working same hy improved machinery.

T. T. CHAPMAN,
120 East Fourteenth St.. Oakland, Cal.

EVERETTE'S MINING OFFICE.

(Pioneer Mining Oeologist's Office of the Pacific Northwest.)

Mining Law, Mine Examinations, Metallurgy.

ASSAYING AND ANALYSIS.

"Consulting Associate Mining Attorney at Law.

Will examine and report upon "Title and Exact Value" of GOLD, SILVER, LEAD, COPPER, COAL, IRON, CLAY or other MINERAL PROPERTIES in any part of the world. Any information mining men may desire to know, relative to the *mineral* or *coal* resources of the entire Pacific Northwest, will he honestly given.

DR. WILLIS E. EVERETTE, 1318 E. ST., Tacoma, State of Washington, U. S. A.

Assessment Notices.

NOTICE OF ASSESSMENT.

KEYSTONE CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Amador City, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22d day of August, 1892, an assessment, (No. 3) of One Dollar ($1) per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room 43, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of September, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 18th day of October, 1892, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. H. ISHAM, Secretary.

Office—No. 310 Pine Street, Room 43, San Francisco, California.

DELINQUENT SALE NOTICE.

GOVER MINING COMPANY,
San Francisco.

Notice—There is delinquent upon the following described stock, on account of Assessment (No. 3) levied on the 28th day of July, 1892, the several amounts set opposite the names of the respective shareholders, as follows:

NEW DISCOVERY.

Mines Revived and Miners Enriched

By the wondarful **MacArthur-Forrest Process**, Controlled by The Oold and Silver Extraction Mining and Milling Co. H. A. W. TABOR, Pres.; LEONARD Oow, V. Pres.; H. A. JONES, 2d V. Pres.; P. OKO. GOW, Technical M'g'r. and Ass't Treas.; T. L. WISWALL. Oen'l M'g'r. and Sec,y; PETER MCCOURT, Treas.; W. L. COOPER, Eng.

DENVER WORKS: On the D. & R. G. R. R. near the Broadway Electric R. R. Depot.

TRADE MARK.

(MACARTHUR-FORREST PROCESS)

GLASGOW WORKS: The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Queensland, Etc.

General Office of Company:

Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: Denver; The Livingstone Gold Mining Co., Boulder Co., Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co., Cal; The Shasta Gold Ex Co., Middle Creek, Shasta Co., Cal.; The Mercur Oold Mining Co., Fairfield, Utah; The Pacific Oold and Silver Extraction Co., Oro Orande, San Bernardino Co., Cal.; The Ora Bella Mining Co., Yavapai Co., Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenua Con. Gold Mining Co., Revenue via Norris, Mont; and others in course of erection.

The object of this company is to introduce the Mac Arthur-Forrest process.

We have purchased from the Cassel Oold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.

If you desire an experimental test communicate with the secretary.

If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons in Denver.

We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.

The process consists of pulverizing the ores to a fineness of about 50-mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tuhs especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.

The total cost, as as rule, does do exceed from $2.50 to $5.00 per ton.

The most desirehle class of ores for this process are the so-called refractory gold, ores pyrites, hematites, manganese and tellurium. We have also treated successfully dry silver ores.

We will he pleased to answer any inquiries and furnish any desired information. Address,

T. L. WISWALL,
P. O. Box 926. Gen. Mgr and Secretary.

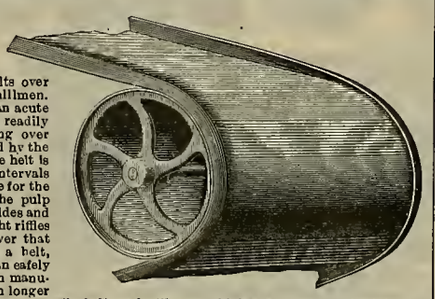
THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets



H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

STAMP SHOES.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

QUARTZ MOUNTAIN MINE.—Amador *Record*, Sept. 8: Recently, a *Record* reporter, in company with Foreman Wm. Ford, went through the first level of the Quartz Mountain mine. There is a 12-foot ledge that averages $7 or $8 per ton, and the sulphurets, with which the rock is well charged, assays from $500 to $800 a ton. The ledge in the northern drift, which is in 160 feet, is being reserved for future operation. In the face of this drift the ledge is five feet thick and looks well. A chute is being opened out on the 12-foot ledge from the first to the second levels, a distance of 132 feet. This chute will greatly facilitate the handling of the ore from the first level. We are assured that the mine throughout never before gave such encouraging promise as at present. Supt. Farwell returned last Saturday from San Francisco, and he expects to soon make some important improvements about the mine that will largely decrease the operating expenses.

IAMA.—The Irma Gold Mining Co. has already got the old Pioneer shaft pumped out, and has started drifting west to the Griesback ledge. A steam hoist, air compressor and machine drills are on the way from San Francisco, and will be in place soon. This will insure lively times on the creek—indeed, more lively than have been for the last 30 years. David Guttman was the promoter of the company.

AMADOR CITY.—The mines in and surrounding Amador have not looked so well in many months past as they do at the present time. Quartz mountain has opened up a rich vein, which promises well. A piece of the rock was shown us, and it contained considerable free gold visible to the naked eye. A. B. Call informed us, Monday, that the Gover mine was looking much better, and that they felt much encouraged over the prospects. The mill started up last week Monday. The Keystone and South Spring Hill mines are looking well. Some people here are prophesying that the Bunker Hill mine will resume operations before Christmas.

THE HECTOR.—Amador *Record*, Sept. 1: It may be of interest to the public to know something regarding the action of the citizens' committee appointed to investigate the blow-up perpetrated by some dynamite fiend or fiends at the Hector mine last May. That committee has obtained some very important clues as to who committed the act. In fact, we are informed that the committee is pretty thoroughly convinced on that score. In justice to Josiah Phillips, we will say that both the management of the mine and the committee are satisfied that he had no hand in the dastardly deed.

Butte.

PROSPEROUS MINES.—Oroville *Register*, Sept. 8: On Sunday, N. Goldstein, Henry Wise, H. D. Lausen and Charley Bills visited Bangor and inspected the mines. From Mr. Goldstein we gather the following particulars: There are three companies at work, the Catskill, Bishop and the Hay & Clark; the former employs 41 men, the second eight men at present and the latter 51 men. The Catskill owners are putting in new steam machinery and are sinking a new and large shaft. They have had but one arrastre at work but soon will have three; Hay & Clark have 15 stamps in operation and are now adding five more. There are four new companies sinking on the blue lead, one of them being a Gridley company and another a Marysville company in which Senator Berry and some Sutter county people are interested. Mr. Goldstein and his party visited the mines and went down into the shafts; in places the blue gravel fairly sparkled with gold. They talked with some of the old Grass Valley miners who are working there and the men said the mines were as good as any they had seen in the State. From one arrastre in six days the Catskill Co. obtained over $2500, or over $400 a day. They visited the Mansfield mine, near Wyandotte, and the men working there said they thought they would not have to go more than ten feet farther to strike blue gravel and find rich pay.

RICH GRAVEL.—Oroville *Mercury*, Sept. 7: H. G. Greiner, proprietor of Recreation Park near Chico, returned yesterday from a prospecting trip in the vicinity of Buck's Ranch. He mined there in early days and knows the country. On this trip he found a gravel deposit which proved very rich in coarse gold. He has located the mine and thinks that he will be able to thoroughly develop it next season. He took out about $20 from a small amount of gravel and it is a fine quality of gold.

El Dorado.

GENTLE ANNIE.—Placerville *Democrat*, Sept. 10: The Gentle Annie mine, under the superintendency of Ben Parlow, is to-day one of the best mines in the county. They have recently erected a hoisting plant and, with their dozen of employes, the place presents a business-like appearance.

Kern.

THE CYANIDE PROCESS.—Bakersfield *Californian*, Sept. 7: The Bright Star M. Co., located on Piute mountain, has several thousand tons of tailings, all of which carry some gold. When the mill was in operation, owing to the scarcity of water, all the tailings were run into slime vats from which the water was pumped back for use in the mill again. Consequently all of the gold that was not saved by the first treatment in the stampmill yet remains in the tailings, as they were not allowed to run away. A few weeks since Don Palmer of St. Louis and Col. Parke of San Francisco, leading representatives of the company, made a trip to the mines and took careful samples of the entire pile of tailings, which were sent to Denver for assay and subsequent treatment by the MacArthur process. The results proved so satisfactory that it was decided to make tests upon a working scale. Consequently five tons of the tailings were sacked and hauled to Caliente by N. T. Williams and Isaac Johns for shipment to Denver. If this practical working test proves satisfactory, the cyanide process will be introduced at Piute next season. At Havilah, a Mr. Stebbins has leased the Reese mill on Clear creek, near the mouth of Copperas creek, and is putting in tanks preparatory to the use of this process on the gold ores of that camp. If this method of dissolving gold by a weak solution of cyanide of potassium proves successful in Havilah, it will be of immense advantage to the mining interests of that locality, for there is an immense amount of low-grade gold ore there in which the gold is finer than flour and practically unobtainable by the usual methods of amalgamation.

Humboldt.

HUMBOLDT OIL LAND CO.—*Western Watchman*, Sept. 10: A meeting of the Board of Directors of the Humboldt Oil Land Co. was held at the office of the secretary, John O'Neil, on Monday afternoon last. The Board organized by electing Jas. Simpson, Pres.; S. F. Pine, Vice-Pres.; Dan Murphy, Treas. For the present, John O'Neil will remain as acting secretary. The Board, as elected at the recent annual meeting, is composed of the following named gentlemen: Jas. Simpson, S. F. Pine, Dan Murphy, E. May and Dr. R. Gross. The meeting of Monday resolved on prosecuting the work with renewed energy, and has adopted a more vigorous system of pushing the work. On Monday next, Pres. Simpson and Director May will start for Garberville in order to make personal examination and to thoroughly understand the present condition and prospects of the work. The well has been allowed to remain unmolested since the drill was disabled, with a view to ascertain what amount of oil may now be coming into the well from seepages. It is the intention of the directors to push the work with a greater degree of speed than ever before. The history given by the superintendent of the nature of the formations passed through, and the indications now reached, were in the highest degree encouraging, and the company proposes to "get there" at the earliest possible moment. The conditions of this well are far more promising than those attending the operations at Mattole, as at East Branch we have good, firm, regular and unbroken sandrock formation, interspersed with hard strata, and over one thousand feet of the well are standing firm and solid, without piping, while the Mattole well has caved so badly that they had to leave their tools buried in the bottom and select a new location. Everything presages an early and successful finish of the East Branch well.

Modoc.

GOOD ORE.—Alturas *Herald*, Sept. 10: If any one thinks we have no mines here let him come and see the piles of ore heaped upon the hillsides near Barnes and Robinett farms. Mr. J. H. Cowan is getting out some good ore from the Robinett mine, while higher up the men working the Sexton & Bush mine are getting quite a huge dump at the mouth of their claim. The Glidden & Asber claim is not being worked at present, owing to harvest season. The Mills & Moss mine is also laid by for a while. Messrs. Boggs & Henderson did some work some days ago on their claim and at a few feet below the surface struck some rich-looking ore. All the claims will be worked more or less after harvest is over.

Nevada.

PROVIDENCE.—*Herald*, Sept. 10: A great deal of work has been done at the Providence mine during the past ten months, and upward of $50,000 has been spent. Over 1200 feet of shaft has been retimbered, 1400 feet of new track rails laid, the old workings cleaned out and a level has been driven nearly 500 feet. The company mapped out a big job, and it has carried it through thus far in good shape. It is quite an enterprise.

STRUCK IT RICH.—*Transcript*, Sept. 10: The Delbi mine, near Columbia Hill, has, for some time, been under a very dark cloud, but now all is bright there again. On Tuesday last a two and one-half foot ledge was struck 30 feet below the lowest tunnel. The rock will go at least $30 per ton, and there is lots of it in sight. Chris. Mallon, the superintendent, brought some of the rock here and it looks fine. Dividends will be in order soon from this grand old mine.

WYOMING MINE.—Grass Valley *Telegraph*, Sept. 10: Saturday afternoon, a good strike was made in the Wyoming mine, in south Grass Valley. In the bottom of the shaft, 165 feet down, the ledge is highly mineralized and shows well in free gold. The ledge is from 8 to 18 inches thick at that point. Samples of this very healthy ore can be seen at the store of Parsons & Quick, on Main street.

THE SEVEN-THIRTY MINE. — Grass Valley *Telegraph*, Sept. 7: The Bowery and Seven-Thirty quartz mines, now owned by the Evening Star Mining Co., will, from present appearances, start up in a short time. Superintendent Taylor, who is one of the most experienced miners on the coast, having operated both on the Comstock and in Amador county, has purchased a fine plant, which is now being placed on this famous claim. As is well known in this community, the ore from this claim has been of about as high a grade as was ever known in this district, most of it running above $100 per ton. The property has been tied up for a long time by litigation, which is now finally settled. As a matter of fact, the Bowery and Seven-Thirty (now consolidated) is one of those claims that has never failed to respond to the hopes of the prospector, no matter how worked. It has a right to be termed one of the luckiest gold mines in Grass Valley district, and this notwithstanding the fact that it has never been systematically worked in the modern sense of the term. From the preparations being made, the claim will be thoroughly prospected according to modern methods. We expect to hear great things of the Bowery and Seven-Thirty at an early date. 150 feet lower, which will give him plenty of stoping for some time. Peter Larcine made some new locations recently that prospect well. He sold one the other day for $100. Colgrove of the Excelsior mine will soon have ont another run of good ore. Smith B. Brooks, who has staved with the Mary Blain mine, is driving a tunnel to tap the ledge. He ran an incline on the ledge until stopped hy water. The ledge prospects well. Geo. Roff has made a discovery near Cecilville, on the South Fork of Salmon, where he panned out $50 in one day. It is reported that he has been offered $10,000 for it. Gus Dannenbrink passed through here on his way to Weaver and reports everything flourishing on Know Nothing. He thinks the new process of working base ores a success.

Shasta.

RICH STRIKE ON SALT CREEK.—*Free Press*, Sept. 10: Recently E. P. Connor, the boss prospector of Shasta county, bought the Kempton mine on Salt creek for $100. He and his son immediately began work on the old tunnel, which is in 100 feet. This tunnel work was commenced in July. At the same time he commenced sinking a shaft to connect with the tunnel about 150 feet from the surface. At a depth of seven feet he took out during the past week several washtubs full of gold quartz. In one pan there was $1000 worth of gold. During the week about $7000 has been taken ont, and they are still in rich ore. On the spot where the shaft was put down was an old block on which former owners of the ground had cut their fuel. These wonderful strikes occur in Shasta county every little while, but nothing before for a long time has quite equaled this strike so near the surface. Miners are used to wonderful sights, but the quartz now exhibited at the bank by Mr. Connor excites all who see it. Mr. Connor offered this property last Saturday for $4000, which was refused.

BONNAN. — The old Washington mine at French Gulch has been bonded to San Francisco parties, who will proceed at once in the work of development. One of the owners of the Mammoth mine arrived this week, and we learn that the development of the mine and erection of a mill will take place right away. Arnold Becher, representing a rich syndicate, has made a payment of $3000 on the bond for the Quartz Hill property owned by Harrison, Lyons and Meeks. Exceedingly rich ore and a rich ledge has been discovered at the bottom of their 118-foot shaft. Becher means business and will no doubt develop a good property. The Greene mine on Deadwood, known as the Queen of Diamonds, which not long since became the property of the bank, has been bonded to San Francisco parties, who have ten men employed in opening up the property, on which they will erect a ten-stamp mill. Under Green's management the mine yielded many thousands of dollars, but finally appeared to be exhausted. Many believe, however, that there is still a large quantity of good ore hidden. It will take some little time to open up the tunnels.

Siskiyou.

GOOD RETURNS.—Yreka *Journal*, Sept. 14: The Spencer quartz mine on Humbug still continues to yield good returns The Boyle claim on the same creek, at head of North Fork, is also yielding good returns, and a rich vein has lately been found which promises to prove still better than any of the quartz yet taken out. The owners of the blue gravel claims on Greenhorn, near the Scott valley stage road, will soon commence an effort to reach the pay streak again, now that the bedrock water is getting lighter in volume to be handled by the steam pump. This is one of the richest claims in the county, but contains a great amount of water between the cement hardpan and the foundation bedrock below it, as well as rich blue gravel. The Golden Gate Co., engaged in tunneling the mountain west of Yreka, has excavated about 180 feet, but get along very slow lately, the bedrock containing considerable iron, with the supply of water gradually increasing.

Trinity.

NEW RIVER.—Cor. Trinity *Journal*, Sept. 10: J. C. Leas and Thos. Nichols of the Sherwood mine made a clean-up on the 23d of last month of nearly $4000 from 73 tons of ore. They expect to have another run in about a month or six weeks. Jas. Gulick has out quite a lot of ore from the Uncle Sam mine. Mr. Sherwood is running a lower tunnel to tap his mine some

NEVADA.

Washoe District.

CONS. CAL. & VIRGINIA.—*Chronicle*, Sept. 10: 1800 level: Along the south end of the drift running south from the crosscut run east from the winze No. 1 sunk from the 1750 level, we have continued to extract some ore from the sill floor upward of milling value. From the crosscut run east from the bottom of winze No. 2, down 45 feet, at a point 20 feet east from the winze, the drift has been advanced 25 feet; total length, 68 feet; in a quartz formation, from which a few tons of milling ore has been saved. Are putting in square sets of timbers in this south drift preparatory to stoping. There has been extracted from all parts of the mine during the week 992 1910-2000 tons of ore, which was shipped to the Morgan mill, the average value of which, per car samples, was $25.57 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $22.52 per ton per battery samples. Bullion shipped to Carson Mint, assay value, $11,199.31.

MEXICAN.—On the 1465 level, the west crosscut, which was started from the drift run north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level near the south boundary of the mine, has been advanced 13 feet; total length, 67 feet, continuing in porphyry and clay.

UNION CON.—900 level: The joint Union Con. and Sierra Nevada west drift has been extended during the week 21 feet; total length west from the joint shaft, 2395 feet. The face is in soft porphyry.

UTAH.—340 level: From the end of the north drift (at a point 432 feet in) from the west crosscut from the shaft station, west crosscut No. 2 has been extended 21 feet; total length, 264 feet, continuing in porphyry, clay and quartz formation.

SIERRA NEVADA.—The Cedar Hill drift has a total length of 20 feet. The entire face is in quartz averaging $30 in gold. The joint Sierra Nevada and Union west drift, 900 level, has been advanced during the week 21 feet; total distance west of the shaft, 2395 feet; face in porphyry and small stringers of quartz.

ANDES.—On 420 level, have been repairing north drift from east crosscut No. 4. Tomorrow, work will have been resumed in east crosscut No. 1, north.

GOULD & CURRY.—During the week we have extracted 38 cars of ore from the old stopes on the 200 and 400 levels, the average car sample of which is $21 98. Shipped to the Occidental mill 122 tons; the average battery assay is $19.53. We have received bullion, the assay value of which is $1011.40.

BEST & BELCHER. — 900 level: The north drift from east crosscut, No. 1, has been extended 17 feet during the past week; total length, 137 feet; face in porphyry, clay and quartz. We have also done considerable repairing during the week.

HALE & NORCROSS.—We continue retimbering main shaft above the 1000 level. 1800 level: During the week advanced the north drift 20 feet; total length, 180 feet. Face in porphyry. The south drift on this level was advanced 25 feet; total length, 175 feet; face of the drift in porphyry.

CHOLLAR.—Are repairing north drifts on the 450 and 750 levels. The east crosscut, 160 feet south of north line, 930 level, is in 50 feet; face in porphyry.

POTOSI.—Are repairing the drift to the top of Lindsey winze, 350 level. Raise from No. 1 crosscut, 1100, is up 12 ft.; in the top there is 18 inches of $20 ore. Are opening a station on the 1850 level in Potosi winze, which is now in 22 feet from the footwall; face in porphyry and low-grade quartz. Are extracting ore from the 550, 950, 1100, 1150 and 1300 levels. Extracted and sent to the mill the last week, 339 600-2000 tons of ore. Worked during the week, 340 tons. On hand at mill, 79 600-2000 tons; average battery assays, $26.50; average car sample assays, $30.90. Shipped to Carson Mint 9234 pounds crude bullion.

BULLION.—The upraise from the east crosscut, 320 feet south of north line, 1300 level, is up 52 feet; top in porphyry and low-grade quartz. Are opening a station on the 1850 level in the Potosi winze, which is now in 22 feet from the footwall; face in porphyry and low-grade quartz. The northwest drift from the 1800 station, Ward, shaft is out 970 feet; face in porphyry.

ALPHA.— The joint west crosscut on our north line from 1800 level of the Ward shaft, is out 14 feet; the face is in porphyry and small stringers of quarz.

EXCHEQUER.—The joint west crosscut on the south line from 1800 level of Ward shaft, is ont 14 feet; the face is in porphyry and small stringers of quartz.

WARD SHAFT.— The joint Alpha and Exchequer west crosscut, 1800 level, is out 14 feet; face in porphyry and small stringers of quartz. The joint Potosi and Bullion northwest drift, 1800 level, is out 816 feet. The face is in hard porphyry.

OCCIDENTAL.—From the stopes on 350, 400 and 450 levels have extracted and milled 175 tons of ore of the average assay value of $19.10 per ton as per battery samples. Have extended the main north drift, 750 level, 8 feet; total distance from winze station, 472 feet. The face is in quartz of some value. The Zadig drift, Sutro tunnel level, has been extended 21 feet; face in porphyry formation; total length of main drift, 635 feet; total length of cross drift, 211 feet.

NEW YORK.—The north and south drifts from the winze 50 feet below the 630 level are each out 10 feet; face in both drifts are in fair ore. Car samples assay from $30 to $40.

Eureka District.

ORE SHIPMENTS.—*Sentinel*, Sept. 10: During the month of August the Eureka and Palisade Railroad Co. received for shipment to Salt Lake City and other points 1741 tons of ore from the following mines: From the Diamond mine, 841 tons; Eureka Con., 441; Jackson, 75; Alexandria, 63; Hamburg, 29; Bullwhacker, 29; Silver Connor, 27; Dunderberg, 19; Phenix, 15; Williamsburg, 15; Mstamoras, 13, and Lord Byron, 10. Total from Eureka district, 1741 tons.

White Pine District.

ORE.—Eureka *Sentinel*, Sept. 10: During the month of August the ore shipments from White Pine district were as follows: From Tom Cornell, 91 tons; Rock Kragnazo, 75; Paul, Ross & Co., 34; Ross & Siri, 26, and J. B. Mathewson, 11. Total from White Pine district, 237 tons.

El Dorado Canyon District.

PLACERS.—Dayton *Times*, Sept. 10: For the past few weeks the new placer locations at the head of El Dorado canyon, about 20 miles from Dayton, have been the subject of a good deal of talk. Raycraft Bros., of Carson, are the pioneers in the new mining region, and there-

fore have the best locations. The canyon is now located for a distance of five miles. The great difficulty to overcome is the want of water. All the lakes and springs in the neighborhood have been located, and ditches are now being dug to carry water to the claims. The ditch will be three or four miles long. With plenty of water it is expected that $100 a day to the man can be made. As it is, those at work make wages. As high as $1 a pan is frequently taken out. The gold is coarse. One nugget has been taken out that was worth $20, and another one worth $12. The mines can be worked only about six months in the year, as the snow makes all operations in the winter impossible. The placer ground is all the way from five to six feet deep to bed rock and pays all the way.

Ferguson District.

GOLD PROPERTIES.—Candelaria *Bell*, Sept. 10: People who assert that the State of Nevada will continue to retrograde forget Lincoln county with its newly-discovered gold mines. In the old town of Pioche, and also in Ferguson district, general prosperity prevails. In the last-named, important sales of gold properties have recently taken place, a couple of thrifty camps have been established, and if we may credit reports, a second Leadville is liable to spring up in a few months, as if by magic, in the southeast corner of the State.

A BIG MINING SALE.—Pioche *Record*, Sept. 8: James Mahana, who went through to Ferguson district last week to consummate his purchase of the April Fool group of mines, was accompanied by A. A. McMasters, a mining man of large experience, and who is also interested in the purchase. Friday evening the two gentlemen returned here, accompanied by Messrs. Reeves, Ellis and Wilson, owners of the claims, and the day following, Saturday, the necessary papers in the matter were drawn up, and are now on file in the county recorder's office. The properties embraced in the detail are the April Fool, Princess, Jumbo, Dublin, Lookout, Monitor, Cliff, Monitor No. 2, three-fifths of the Swifter and three-fourths of the Millionaire, and the consideration to be paid is $150,000. John B. Farish, A. A. McMasters James Mahana and R. C. Chambers are the purchasers, who pay something over $1000 down for the mining and other supplies now on hand at the mines, and are to pay $50,000 within 60 days from Sept. 6th, and $100,000 within four months thereafter. The purchasers are to take possession of the claims and work and develop during all of their said time, one or more of the claims, and after the first day of October are to work not less than ten men. No ore is to be moved from the premises, except for assaying purposes, until all the purchase price is paid. The sellers, Reeves, Ellis and Wilson, are to have all ores now extracted, and have 30 days in which to remove the same. The value of the ores now on the dump is estimated at from $7000 to $10,000. The purchasers are to secure the properties against any liens for wages or other claims. Mr. McMasters returned immediately to the mines and assumed charge, while Mr. Mahan returned to Salt Lake to make provision for immediate work. This deal is the largest which has taken place in this section since the palmy days of Pioche, and the properties in every respect are said to justify the price to be paid, as they are the cream of the district. With active work on these properties, and a continuance of present operations on the Magnolia, the other rich mine of this district, the next 60 days will determine whether Ferguson is to come before the mining world with a boom or by only a gradual development of its resources.

Freiburg District.

SILVER AND LEAD.—Pioche *Record*, Sept. 7: J. W. Reed and Lewis Sharp brought in yesterday two tons of ore which will run 60 ounces silver per ton, and carries 50 per cent lead. They dispose of the ore at the smelters here. The ore is from the Bull of the Woods claim, a recent location. Four feet of ore of this character is exposed and will be mined and marketed here forthwith.

Tuscarora District.

NORTH BELLE ISLE.—No. 1 north drift, south 300-foot level, extended 9 feet. The vein is looking better.

NORTH COMMONWEALTH.—Extracted 5 tons of ore, some of it being very high grade. Have on hand about 40 tons of concentrates, assaying $224 per ton.

BELLE ISLE.—South drift, 250-foot level, extended 8 feet, and a stope has been started on the ore. The upraise, same level, has been extended 5 feet; rock not so hard and vein looking better.

NEVADA QUEEN.—Extracted 30 tons first-class ore assaying $260 per ton, and 383 cars second-class, battery assay $26 per ton. Received from Union mill on account of ore sold $9000.

COMMONWEALTH.—Stopes from the east line drift show an improvement since last report; ore is better grade. East drift from No. 3 chute advanced 19 feet; still in vein giving low assays. Third level stopes about the same, yielding ore assaying $28 per ton. Hoisted 8 cars first-class ore, $220 per ton, and 171 cars second-class sent to concentrating plant, battery assay $26 per ton.

ARIZONA.

WHITE HILLS.—Mohave *Miner*, Sept. 10: Encouraging reports are received from the new mining camp of White Hills, and the prospects of a thriving mining section are very promising indeed. We are informed by reliable and experienced mining men that the mines never looked so well as they do at present. Nearly all the properties being worked are showing up to advantage as depth and development work progresses. It is true that proper facilities for working the mines in a systematic manner are in an unsettled condition as yet, but time and capital will shortly remedy this drawback and put the properties on a secure paying basis. The day has gone by when capital can be induced to invest two or three hundred thousand dollars on a prospect hole five or six feet deep with indications of poverty and delirium tremens in the bottom of the shaft. Capitalists want mines or the resemblance thereof. Mines of exceeding richness are to be seen in Indian Secret district, without doubt, and the outside States and Territories are aware of this fact, and capital is awaiting a favorable opportunity to invest. Every blow with the pick and every shot put into the ledge increases your chances of sale and enhances the value of your property. The mines at White Hills are improving with development. The Horn Silver, which had pinched out at a depth of about 30 feet, is now showing a fine vein of horn silver and chlorides. The Grand Army, at a depth of 60 feet, is in big ore. One shaft has a three-foot vein of chloride, with nuggets and globules of horn silver through the entire mass, the other shaft, 400 feet away on the same vein, showing 30 inches wide of ore equally rich, while some 400 feet east of this another shaft is being sunk with a foot of $1000 ore, which is gradually widening. The Prince Albert is being leased in 100-foot blocks. Very rich ore is found in all the workings.

MONTANA.

THE SMELTER.—Butte *Inter-Mountain*, Sept. 10: The new Butte & Boston smelter is fast approaching completion. It will be the model smelter-building of the West and when the engineroom is added will be 265 feet in length by 50 feet wide. There need be no fear that the that the present building will ever be destroyed by fire, for in the whole length and breadth of the works enough wood cannot be found to make a toothpick. The walls and sides are of corrugated iron, the rafters and upright columns being ribs of iron. The floors consist of sections of cast iron, and a locomotive could run over these sections without any danger of them breaking. The company is now figuring on some very extensive improvements to the smelter. It has been decided to add a converter process to the works, something similar to that at the Parrot, and for this purpose a 150-horsepower engine and a compressor have been ordered and will shortly arrive on the ground. This additional machinery will greatly increase the output of the smelter and will give employment to a great number of miners and smeltermen. At present operations at the works are progressing on nearly the same scale as before the fire. A few men are being put on at the mines each week as the capacity of the smelter increases, and in a week the properties of the company will be running in full blast.

CASTLE.—*Mining Journal*, Sept. 10: Walter J. King has just returned from Castle and brings good news from that camp. A force of men is being put on the Cumberland which will increase the number employed to 65 or 70 men. A hoist is being erected on the jumbo and when it is in order a force of men will be put to work on that mine. There is no news about a railroad. It was said that J. Kennedy Tod could give no assurance that a railroad from Great Falls would be started this year. A great discovery has been made on the Cumberland, a body of carbonate ore having been found above the 200-foot level, right near the first workings of the mine. It is estimated that there is more ore in this body than has been taken out of the mine up to this time. During the last run of the Cumberland smelter nearly $800,000 worth of bullion was produced.

PARK DISTRICT.—Mr. O. A. Southmayd, with Mr. Pascoe, a mining expert of Butte, visited the properties of the Goodyear M. Co. in Park district, Jefferson county, last week. Mr. Pascoe expressed himself as highly pleased with the properties of this company and adjoining claims, and was of the opinion that it is a rich mining country. The Goodyear Co. owns five claims which lie on both sides of Indian creek, and two claims one mile north, making seven claims and a millsite. The company is sinking on the Whopper shaft on the Jenny Lind lode. It is now down 130 feet, following a shoot of ore, the dimensions of which are unknown. Samples taken from across the shaft ran $38 in gold, 18 oz. of silver and 40 per cent lead. There are two leads on the Jenny Lind and it promises to be a good property.

OREGON.

ROAD TO THE MINES.—Eugene *Register*, Sept. 10: We can now state positively that we are to have a road to the Blue River mines, and that in a short time. George Larrison of Springfield, who has had a large amount of experience in building such roads, has been engaged to superintend the work, and it will be done by day labor instead of by contract. The road to be built will be about 15 miles long, and will extend from Pepiot's to the top of Gold Hill. The lowest bid for the construction of the road was $1760, so it will probably cost in the neighborhood of that amount.

WASHINGTON.

MEADOW CREEK MINES.—*Madre de Oro*, Sept. 10: The Meadow Creek mines, on the southwest of Lake Chelan, are attracting considerable attention. Several good strikes have been made lately showing both gold and silver, with silver predominating. There are about 50 miners now at work prospecting and developing these discoveries with satisfactory results. The first discoveries were made in May of this year.

PLACER MINING.—Placer mining on the Similkameen is once more coming to the front. E. A. Dolan, an old miner, was at our office this week with a pan of dirt which he washed out here, and got about 25 cents' worth of gold from it. He and his associates have located a placer claim four miles up the river, and will begin work at once on a current wheel to raise water on to the land for hydraulic mining.

Market Reports.

Local Markets.

SAN FRANCISCO, Sept. 15, 1892.

General trade the past week has been fair. The State and district fairs in this and adjoining States have been largely attended, which no doubt contributed to the dull spell. It is quite generally asserted that after the first rains, business in the rural districts will revive, while in the more mountainous sections, winter-stock buying will be largely stimulated. With foundrymen and ironworkers in general, there is a fair degree of activity. It is contended that if lower local freight charges ruled, the various manufacturing industries in this city would have all the business they could possibly handle. Railroad construction and railroad-surveying continue on an unexampled large plane. The latter, it is said, is a forerunner of increased railroad construction in the near future. The more general introduction of electricity as a motor-power in railroads, manufactures and mining appears to be creating a decided change for the better.

The local money market does not work close, which is contrary to the heretofore generally expressed belief of financiers. While there has been, and continues to be, a liberal call for funds against warehoused grain, yet there does not appear to be any difficulty met in securing reasonable accommodations without strengthening the views of lenders. The amount of money already tied up in warehoused grain is variously estimated at from $5,000,000 to $10,000,000. Remittances are said to be more free. As a rule, interior merchants have smaller accounts in this month than in the corresponding month for several years past.

The low price of silver, while against silver mining, appears to be stimulating the demand for gold mining propositions. So far as we are able to learn, there are more inquiries for gold mines than has obtained at any time within the past five years. The inquiry is not confined to this country, for we find foreign agents in the market for paying propositions.

Late mail advices from New York report the banks decreasing their reserve by freer loans and more liberal shipments to the cotton and grain-growing States. The most striking feature of the monthly financial reports of the Treasury is the large increase in the revenue compared with the same month last year. The total revenue for August was $34,032,928, against $28,884 851 for the same month last year. The Treasury owes no small part of its favorable balance at this time to the extraordinary imports this year and the large duties payable thereon. The net gold owned by the Treasury was only $3,711,925 greater than on August 1st, and the net silver owned in excess of certificates outstanding increased during the month $1,433,321.

In speculative securities, industrial stocks and railroad securities were, at last advices, receiving a fair degree of attention, notwithstanding the cholera scare, and the opinion was generally expressed that more active times were near at hand.

The result of the Treasury at Washington receiving $20,000,000 in gold coin from this city has been to lessen the export demand. The falling off is due to abrasion owing to the coin gaining a larger circulation on this coast. The old coin did not net the profit that the new coin did, owing to lighter weight. A New York exchange says that one of the large shippers, referring to the matter, says that a great deal of gold was very poor and the balance only middling. Before the California gold arrived this was not the case. Another shipper says that that his account sales show that the gold he shipped did not turn out as he had reason to expect, but inasmuch as he received a higher premium than some of the other shippers, he lost nothing by the operation.

Dows, Jones & Co. of New York have compiled a lengthy but very interesting and important table showing the changes that have occurred during the last four years in the relations of the United States Treasury to the finances of the country, from which it appears that the stock of gold coin and gold bullion in the Treasury has decreased $88,500,000. During the same time the money in circulation which the Treasury stands pledged to redeem in gold has increased $142,500,000. Four years ago the proportion of gold to the obligations to be redeemed in gold was 76.9 per cent. Now it is 42.3 per cent, a decrease of 43 per cent. This change is almost wholly due to the operation of the act of 1890 requiring the purchase of silver bullion and the issue against it of Treasury notes. The comparison shows but little change in the United States notes outstanding or in the gold certificates in circulation. The bulk of the gain has been in Treasury notes. There may be a question at some time in the future as to whether these notes, being a coin obligation, may not be redeemed in silver, but at present the Government is prepared to redeem them in gold, and recently delivered $1,000,000 in gold on presentation of $1,000,000 of Treasury notes. In receiving the gold obligations in circulation, we have not included silver dollars nor silver certificates. The silver in circulation has, however, increased in four years over $136½ millions. The total silver in circulation now amounts to $450 millions, secured by silver in the Treasury to the amount of 357¾ millions in standard dollars and 83½ millions in silver bullion, a total of about 441 millions.

Late advices report that nothing will probably be done by the Administration toward calling the International Monetary Conference until after the election, or, at least, until the deaths by cholera abroad show a very material decrease and the near future gives assurance of its being under control.

SILVER—The market has strengthened slightly the past week. The slow pace with which an advance of about one cent per ounce has been made shows there is not much life to the market, and that evidently the syndicate is feeling its way for future manipulation. With better-informed financiers there is a growing belief that the market value of the metal will sink considerably lower before the syndicate will be prepared for a long bull campaign. While giving expression to these opinions, yet they are firmly convinced that much higher prices will first obtain, which, it is said, will allow the marketing at a good round profit of the large quantities of securities and commodities whose market values are controlled by that of silver. It is now quite generally conceded that the monthly purchases of silver bullion by the Mint is in excess of the monthly output of the mines in this country.

MEXICAN DOLLARS—The market has been inactive but fairly firm at around 67¾ cts.

QUICKSILVER—Receipts the past week aggregate 332 flasks. The market is fairly active, with some shading on round parcels.

BORAX—Receipts the past week aggregate 1069 cts., and the exports by sea 2010 cts. to New York. The market is fairly steady. The low freight rates to the East are stimulating shipments.

LIME—Receipts the past week aggregate 5423 bbls. There is a continued free-shipping inquiry for the Hawaiian Islands. The home demand is said to be active. The market is quoted at $1.25 to $1.50 per bbl.

LEAD—The market is steady. Consumption this year shows a decided increase over the like time in last year. Eastern mail advices report a dull market with a poor support given either by consumers or speculators.

TIN—Receipts of pig from the Temescal mine appear to have fallen off very considerably, for the last consignment aggregated only 86 pigs. The market for both pig and slate is slow, with quotations largely nominal. London cables to *Iron Age* say that "Pig tin has been rather dull. Most speculators are awaiting action of the larger holders here and in America. Outsiders hold aloof. Visible supply has increased 574 tons during the month, all American. Business in tin plate generally has been trifling. Rather more doing in third-grade charcoals at 12s 9d in Swansea, but otherwise no improvement whatever is noticed. Stocks at Swansea now about 135 000 boxes, against 50,000 boxes a year ago. Considerable reduction has taken place during the past few days."

PIG IRON—The market is reported essentially unchanged. The consumption in this State and up north continues on a liberal scale. Late Philadelphia advices report plenty of pig iron to be had at the prices recently ruling, and the regular customers of the leading furnaces in this section have no difficulty in securing supplies at the old figures, but producers of the better grades of material are not inviting long-time contracts at present quotations.

COPPER—The market continues in an irregular and unsatisfactory condition, Eastern mail advices indicate a prospective lower range in values. Foreign cables report a soft market. To the cholera scare is largely attributed the prevailing dullness.

COAL—Imports the past week aggregate as follows: Newcastle (N. S. W.) 11,001 tons, Sydney 2567, Carmen Island 2100, Pioche Harbor 400, Nanaimo 7182, Coos Bay 450, Departure Bay 2407, Seattle 1000; total, 27,107 tons. The market continues unchanged. It is said that at times more or less cutting in prices is indulged in by importers. The consumption demand is disappointing, for the quantity taken is very considerably less than had been estimated.

Mining Share Market.

SAN FRANCISCO, Sept. 7, 1892.

The market for Comstock shares was quite active the past week under the leadership of Sierra Nevada in the north end group, Hale & Norcross in the middle group and Belcher in the Gold Hill group. Fluctuations in the quotations for the leaders ranged from 10 to 20 per cent. The rapid fluctuations combined with bull points and bull reports in the rings organs, have had a stimulating effect on the "mudhens" who are out in increased numbers trying to catch the turns. As yet the "gutter-snipes" are slow in catching at the bait, but there can be no doubt of their not being able to much longer resist the temptation. While the mines would unquestionably pay dividends provided the work of extracting and milling of ore was honestly conducted, yet the public should fight shy of the game which is afraid to conform to the law under which the companies incorporated. Until the law is conformed to the game will continue assessments for outsiders and bullion for insiders. Of course when the market is made active with lively fluctuations there are chances of making money, but when once drawn into the whirlpool it is almost an impossibility to withdraw and the victim at last sinks in the vortex of financial destruction, if not a physical wreck. It is a great game this, of working the Comstock mines and strewing the shores of time with financial, physical and moral wrecks.

The present movement in the Comstock shares is said to be due to a desire of the rings to placate their more pliant tool brokers, who appear to have sold themselves, body and soul, to do dirty work (giving proxies, etc.) for the inside. The business had dwindled to such small proportions that the brokers were not able to pay office expenses, besides which, the two exchanges had to levy assessments to meet current expenses. Whether the present move in shares will be a success remains to be seen. At this writing, it looks very much as if, in the end, it will prove a failure, and, if so, outsiders who bought at the higher prices will be heavy losers, besides, if they hold, being called on at stated times for assessments. It is a great game, this, of working the Comstock mines.

In dealing in Comstock shares, outsiders should not overlook several very important factors against much of a deal. In the first place, with the mines worked and the ore milled as at present, moneyed outsiders will not invest in the shares, for the developments in the Hale & Norcross suit are too fresh to be ignored. In the second place, without a complete reformation, but not through tools as insiders are now trying to do, in working the mines and milling ore, if shares are advanced two or three times above what they now are, to whom will the rings be able to sell? Former bull gudgeons are financially killed off, and with several millions shares in hand, it will be impossible to find buyers at very much higher prices. There are several large moneyed operators, knowing this to be the case, that stand ready to hammer the market when prices are advanced sufficiently to justify short selling. Then, again, the decision of the courts against margin-dealing makes brokers offish in carrying accounts except for tried patrons, and even for these the chances formerly run are not now taken. Evidently the rings, in their ghoulish selfishness, have killed the goose which laid the golden eggs.

It looks very much as if D O. Mills has instructed Bob Morrow to give the brokers a few crumbs by by sending the market up and at the same time, provided gudgeons are drawn in, sell the market down after the leading shares are advanced to certain figures. In selling the market down there must, to make it a success, be rallying points.

The street and newspaper organs are full of bull news from the Comstock mines. If present bull information does not draw in gudgeons, then more will be in order—some of which will be true, but the larger part will be made to order. The reported new (?) find in Sierra Nevada will, in time, be found to be in another company's ground, provided the rings meet with success in peddling out shares in that and adjoining mines. The new (?) developments in Belcher will aid in securing buyers for that and adjoining mines, and greatly aid the rings to collect the pending assessments on shares of Crown Point, Overman, Con. Imperial and shares of one or two other mines in that end of the lode. The diamond drill (which, by the way, has been in use for some time) is being used in Con. Virginia to help the market along. Work that has been under way for some time in several of the mines is being allowed to leak out, but the most important is still kept back. Probably it is just as well as long as the rings get the bullion. Until there is a genuine conformity to the law by the several mining companies, it is well to exercise caution in dealing in mining shares; the mines are one thing and the share market quite another.

The share market opened dull this morning and continued inactive up to the noon hour. The announcement of the levying of a 25-cent assessment by the Crown Point Company, with reports of other assessments pending, cools the ardor of outside dealers. As the ring evidently wants, or at least it looks so, to have outsiders pay the assessment, a small assessment was levied. It is in order now to induce holding and also buying to make active the shares of Belcher, Hale & Norcross, Sierra Nevada, and probably two or more other mines.

Eastern Metal Markets.

NEW YORK, Sept. 11.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	38¾	83¼	11 25	4 10	20 27½
Friday	38¾	83¼	11 25	4 10	20 30
Saturday	38 3-15	83¼	11 25	4 10	20 30
Monday	38¾	83¼	11 25	4 10	20 30
Tuesday	38¾	83¾	11 25	4 05	20 25
Wednesday	38¾	83¾	11 25	4 05	20 20

Quicksilver is irregular and weak. Tin is inactive and in buyer's favor. Copper is weak, with a downward tendency. Lead is barely steady. In pig iron there is still more or less cutting.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPT. 6, 1892.

481 927.—CABLE LOGGING MACHINE—J. Buckley, Eureka, Cal.

482,081.—ORCHARD CULTIVATOR—Daly & Neil, Covina, Cal

482 211.—SEPARATING SAND AND SLIMES—Geo. Gates Jackson, Cal.

482,123.—HISTORICAL TOY NOVELTY—F. C. J. Grebe, Los Angeles, Cal.

482,040.—SLACK TAKE-UP FOR AIR BRAKES, L. Guillemet, S. F.

482,125.—CAR COUPLING—G. C. Harlin, Seattle, Wash.

482,250.—SAW SET AND GAGE—C. F. Heath, Durham, Cal.

482,059.—CONSTRUCTION OF SEAWALLS—B. C. Kenway, Tacoma Wash.

481 956.—AUTOMATIC TROLLEY DISCONNECTOR, G. A. Kimball, Seattle, Wash.

482,183.—WATER PURIFIER FOR STEAM BOILERS, J. MacDonald, Los Angeles, Cal.

482,131 —ELEVATOR-CONTROLLING MACHANISM, A. J. McAdam, S. F.

482,047.—SHIPPING RECEIPT-BOOK—J. D. D. Mortimer, Stockton, Cal.

482,269.—CLOTHES-DRIER — G. W. North, Clarkes, Or.

482,272.—FRUIT-PITTING MACHINE — F. C. Philips, Healdsburg, Cal.

482,283.—FRUIT-DIPPER—E. E. Thomas, San Jose, Cal.

482,284 —FRUIT-PITTING AND SPREADING MACHINE—J. D. & E. E. Thomas, San Jose, Cal.

482,285.—GROCERS' CADDY—C. Toohey, S. F.

482,103.—PORTABLE BAND-SAWING MACHINE, A. C. Speer. Woodville, Or.

481,990.—POUND NET—Williams & Clevelaud, Astoria, Or.

482 288.—CAR COUPLING—S. R. Williams, Monmouth, Or.

The following brief list by telegraph, for Sept. 13, will appear more complete on receipt of mail advices:

California—Ira J. Briggs, San Francisco, lubricating cup; Q. V. P. Day, device for whippistres; Patrick J. Doling, Folsom, airsngth-testing device; John H. Drillsr, Los Angeles, automatic cut-off cask-filling faucet; Frank Forster, Etiwanda, movable sied; John G. Letteller, Los Angeles, machins for making box-hinding channsl strips; Joseph Mallard, San Geronimo, and J. H. Jones, San Francisco, devica for supporting and carrying vessels; John C. F. McGriff, Los Angeles, wirs alarm; M. P. Schetzsl, San Francisco, apparatus for the propulsion and transmission of water; Charles S. Webber, San Jose, stringing piance; Hagemann Brewing Company, San Francisco, trademark for beer.

Washington—John N. Brown, Roslyn, car-coupling; Lucia F. Cook, Tacoma, transportation system.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AIR-COMPRESSOR.—Michael Dillenburg. No. 481,850. Dated Aug. 30, 1892. This invention relates to air-compressing machinery and consists in such a construction of the piston and valves of the air-compressing pump or cylinder as to greatly increase their efficiency and to reduce danger of breakage of parts. The piston consists of an exterior sleave with an interior web, in which the piston rod is fitted to slide, and by a novel means the web and exterior sleeve are locked together, but are easily separated when desired. The valve is carried upon the end of the piston rod; a collar around the rod below the valve fits a chamber in the web and presses upon a spring contained in the chamber. This spring closes the valve against the seat in the outer sleeve and allows it to be drawn away when the piston is being retracted, so that air may flow freely through the valve for a new stroke.

LAUNDRY DRYING-ROOM.—John F. Chappell, S. F. No. 481,845. Dated Aug. 30, 1892. This drying-room for laundry purposes consists of a series of fireproof, nonconducting, vertical sections having drying-ropes extending longitudinally between them, suspending traveling rollers upon which they are easily moved to withdraw them from and introduce them into the drying-room, said endplates forming the ends of the drying-room when they are all closed, and the inner endplate closing the opening at the outer end when either one of the sections is drawn out for the purpose of removing or changing the clothes upon it. The ceiling is also of peculiar construction.

FRUIT-PITTING AND SPREADING MACHINE Judge D. Thomas and Edward F. Thomas, San Jose. No. 482,284. Dated Sept. 6, 1892. The object of this invention is to provide an apparatus which receives fruit, such as apricots, peaches and similar fruits having stones or pits, from the grader, places the fruit in position with the pit or stone standing with its longer diameter vertical, and delivers the fruit in this position to the knives, which split it and separate the pit from the meat, which is then spread and delivered upon trays in which it is to be dried, or it may be delivered without spreading when designed for canning or similar purposes.

FRUIT DIPPER.—Edward F. Thomas, San Jose. No. 482,283. Dated Sept. 6, 1892. In handling prunes, the fresh fruit, when it arrives from the field, is first graded and is then dipped in a strong caustic solution to cut the skins, then passed from this solution into a clear-water washing solution and thence to the trays upon which the fruit is dried. After drying, it is again returned to this house and is then passed through the steam and hot water for the purpose of cleaning and brightening it. This apparatus is designed to carry the fruit through these various dippings and to economize in the time and labor required for these repeated handlings. The apparatus consists of a peculiar wheel rotating within a casing having a dipping-trough at its lower portion.

SAW SET AND GAUGE.—Chas. F. Heath, Durham, Butte Co., assignor of one-half to W. W. Taylor. No. 482,250. Dated Sept. 6, 1892. This device is especially applicable to the setting of the teeth of crosscut saws and gauging the set thereof, this work being accomplished without recourse to a shop or large set of tools. It consists of a block of metal having one end formed to serve as an anvil, upon which the points of the teeth may be set, the anvil being held in one hand and the hammer by which the points are bent or set being held in the other. This block has formed upon another edge of it devices by which the gauging of the set is effected, and upon still another edge a means for effecting a set by what is known as a "spring-set." The device is a hand-tool, designed for the use of sawyers at work in the woods at a considerable distance from any point where tools can be obtained for keeping saws in order.

GROCERS' CANNY —Cornelius Toohey, S. F. No. 482,285. Dated Sept. 6, 1892. This is one of that class of receptacles serving as reservoirs from which to draw materials such as tea, coffee, etc., and known as caddies. The general object of the invention is to provide a caddy which, by reason of the independence of its base and top, will enable the grocer to use the base portion constantly and to fit thereto any number of successive tops. The special object is to provide for the utilization of the linings of tea-cases, which for this purpose will preferably be made of tin.

SEPARATING SAND AND SLIMES.—Georga Gates, Jackson, Amador Co. No. 482,241. Dated Sept. 6, 1892. This is an apparatus for separating the slimes and sand from coarser material arising from the crushing of ores. After the pulp has passed over the amalgamating plates of a battery, and such valuable precious metal as will adhere to the plates has been arrested, there still remains a considerable portion which is valuable, which passes off in the form of extremely light slimes, and which will pass off in suspension in the water. In order to separate this from the heavier and coarser sands which still remain, Mr. Gates has devised the apparatus which he has patented.

FRUIT-PITTING MACHINE.—Frank C. Philips, Healdsburg. No. 482,272. Dated Sept. 6, 1892. This machine for pitting fruits consists of a framework having a horizontal stationary shaft fixed at one end near the top and a sickle-shaped knife, the shank of which is fixed to the shaft so that the cutting-blade stands radially above the shaft and between two sprocket wheels which turn loosely upon the shaft. Other sprocket wheels are mounted upon a shaft at the opposite end of the frame, and chains passing around these wheels are caused to travel by a foot-treadle or other power and intermediate belting. These chains have carriers attached to them adapted to receive the fruit upon an elastic and slotted support, which carries each fruit against the edge of the knife where it is split and the pit is thus forced back through the opening in the elastic carrier while the latter passes on over the knife by reason of the slot in the carrier and deposits the fruit in a suitable receiver.

FOR "deadening floors" Gen. Loyre suggests the use of wood shavings, made incombustible by dipping them in a tub of whitewash or cement. Soft substances, including air-spaces, make an excellent nonconducting material to sound, and the saving in weight is important. A preliminary dipping in chloride of lime will disinfect the space between the boarding and the plastering. Mineral wool is much better, even if more expensive, and has the added value of positively excluding rats.

MINING SHAREHOLDERS' DIRECTORY.

Testing and Working Silver Ores

A VALUABLE BOOK

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of limo, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Krochnke's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tellings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

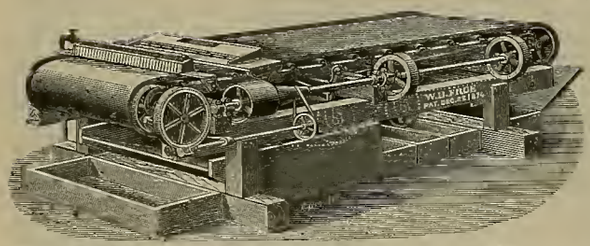
FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.



SAN JACINTO ESTATE, LIMITED,
Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators), extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner ..... 800, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

A New Quartz Crusher and Pulverizer.

A. P. Anderson of Oriental, Esmerelda Co., Nevade, is a prectical man in the quertz crushing business and has not invented a crusher because he could meke a device in thet line, but beceuse he thought he could get up as good a one as eny now in use in the country. The mechine which he has just petented through the MINING AND SCIENTIFIC PRESS Patent Agency, is a wet and dry crusher end pulverizer, heving immense screen surfaces, and intended to be run with great speed, or, as he says, "from 20 to 40 miles per hour." There are very few pieces to it end ell of them ere strong. The crusher rollers are intended to be about one-third the diameter of the crushing compertment, to leeve plenty of room for the free circulation of the material to be crushed. The cuts on this pege show the new machine. Fig. 1 is en elevetion, the pulp-bonnet being partly removed; and Fig. 2 is a vertical cross-section.

A A are two rollers journeled upon the supporting frame B, of eny suitable construction, so es to stand parallel with eech other and neer together. Upon these rollers end supported hetween them is a short cylinder C, the length of which is approximetely the seme as its diemeter. Upon eech end of the exterior of this cylinder are flanges D, which serve as guides treveling against the ends of the rollers A to keep the cylinder in place upon the rollers. A belt E passes around this cylinder and any suitable driving pully or device, from which power is applied to rotete the cylinder.

The roller A, which is nearest the source of power, has its central portion *a* cut away sufficiently to allow the lower portion of the belt to pass out freely between tbe two sides of the roller, and the rear roller hes a chennel or depression *a'* cut in its face corresponding with the channel in the front roller, so as to allow the belt to pess freely between the roller and the drum. By this meens the drum is caused to rotete as repidly as may be desired by the movement of the belt which passes about it, and the supporting rollers turn freely, so as to allow it to to rotate easily. The drum is made of iron or other suitable materiel, end has in the center, projecting inwardly, a ring or flange G, which serves to divide its interior into two parts. Within this drum are fixed the dies H, which are made in the form of rings, the central portion of which is thicker than the ends. The inner ends of the rings ebut against the central ring and the outer ends against a ring I, which extends entirely around the inside of the drum at eech end, seid rings being seperete from the cylinder C and fitted into its ends against the ends of the dies H in any appropriate menner. The thicker portion of these dies form the surface upon which the crusher-rollers F travel.

This crusher consists of two separate rollers, one of which is adepted to travel in each of the compartments formed by the centrel ring G of the cylinder. These rollers have squere tepering holes through their centers, end are connected together by a square shaft *f* (which is also slightly tapering), which is screwed fast in place by a nut *f'*, fitting onto the screw-threaded smaller end of the shaft and seeted in the depression made for it in that end of the roller. Around each of these rollere is fitted a shoe Q, which consists of a cylindrical drum open at one end and having a head at the other. These drums fit over the cylindrical rollers, being put on from the inside, so that the closed ends or heads are adjacent to each other.

At each end of the cylinder is fitted a screen K. The peripheries of these screens abut egeinst the flanges D upon the outer ends of the drum, and are clemped in plece by rings L, which fit outside of tbe screens and hold them ageinst these flauges, being secured by suitable bolts I'. M is a ber bolted or otherwise secured to the rings L, and extending ecross the end of the cylinder having en enlargement at the center with a hole through it. Through this hole is fitted a feed-funnel N, the inner end of which

Fig. 2.

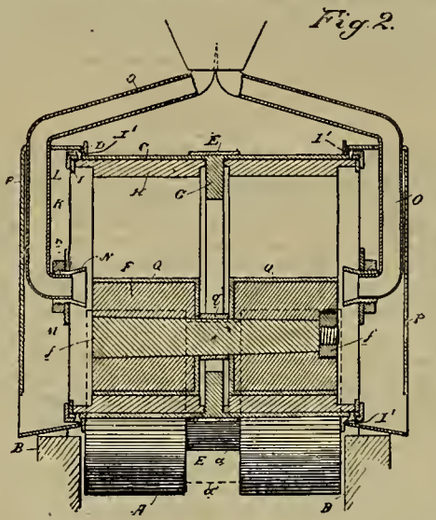

Fig. 1.

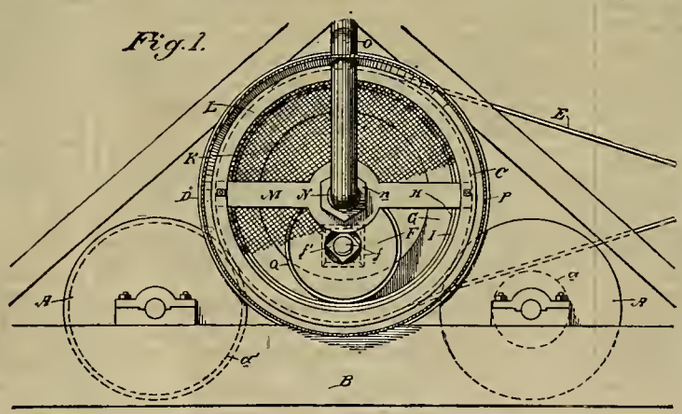

ANDERSON'S WET AND DRY QUARTZ CRUSHER AND PULVERIZER.

is of lerger diemeter than the outer, and it is held in plece by a nut *n*, which screws onto the outer end. A ring I extends around the inside of each end of the cylinder hetween the periphery of the screen and the inner ends of the dies within the cylinder, as previously stated.

A feed-pipe O extends from the supply-hopper down to a point above the cylinder, where it divides, and one branch passing around eech end of the cylinder delivers the meterial through the central feed-funnel N. When the apparatus is set in motion, the drum or cylinder is rotated with greet rapidity, and the two-part roller is caused to travel around its interior, while the meterial to be crushed is fed in through the feed-hopper and chutes. As fast as the material is pulverized it passes tbrough the screens and is discharged over amalgamating plates or in any desired manner. Over each end of the cylinder are fitted what the inventor terms "pulp-bonnets" P, which are slightly funnel-shaped, and serve to prevent the pulp from being splashed out to a great distance from the cylinder hy its rapid rotetion. These pulp-bonnets fit closely to the ends of the cylinders, but the cylinder or drum revolves freely while the bonnets prevent the escape of the meteriel. The feed-pipes pass tnrough the pulp-bonnets at the top.

Utilizing Waste Products of Petroleum Distillation.

In the distillation of petroleum or hydrocerbon oils for the purpose of manufacturing illuminating gas there remains a residue after the lighter portions are distilled awey. This residue consists of water and heavy oil, which differs considerahly from the tar which forms the residue of coal distillation. The characteristic of this petroleum residue is a tough, elastic, oily consistency, which ceuses it to envelop and cover smell particles or globules of the water with which it is mixed with such persistency that it is impossible to separate the two by any ordinary known process. At the works of the Pacific Ges Improvement Company at North Beach, in this city, this residue has been allowed to run to waste, since it was not considered of eny velue for fuel or other purposes. J. P. Engle, of the firm of Engle & Son, deelers in lumber and moldings, whose shop is neer the gas works, now uses this meteriel for fuel under the boiler in his shop, having devised and patented a meens to effect a seperation of the waste products and a way to recover them.

He employs an apparatus in which two surfeces are constantly rubbed together while the mixture is fed between them, so that the mechanicel rubbing acts to separate the heavy oil from the water and allow the letter to flow off separately from it. When this seperation has once been made, the oil will remain seperete from the water, and, being slightly heavier, will gradually sink to the bottom, so that the weter may be drawn off from the top neerly or quite clear of the watery mixture. The oil thus seperated mey be used directly as a fuel or mixed with any dry refuse meterial which will ebsorb it end form a permanent fuel for future use, or it may be employed for any other purpose for which it is fit. This weste product is unlike coel-tar, from the fact that it is so nearly the same specific gravity es weter thet it will not separate by gravitation. Furthermore, the constituents of this petroleum-oil are tough and elestic, covering the globules of water so that the necessery heat required to convert the water into steam only serves to creete a foam which on cooling again leaves the originel constituents the same as before boiling. In order to make a complete separation of the water from the oil, Mr. Engle employs any weste-absorbent meterial, such as sawdust, shevings, cotton and woolen waste, rice-husks, etc. A very simple apperetus is employed to complete the separetion after the substances have passed through the mechenicel rubbing apparatus. The peculiar property of the petroleum compound is such that the heavier portion is more reedily absorbed by the dry meterial than the water. The consequence is thet the oil and spirit will he absorbed first, and the water will remain unebsorhed and flow out immediately through a waste pipe, end the mixture thus formed is immediately ready for the grate. Mr. Engel seys thet it will then he found to produce a fuel equal in heet and endurance with the usual run of steam coal. This mixture he is now using under his boiler for fuel purposes with remarkahle success.

THE Live Oak Drift Gravel Mine Company has brought suit against its former secretary, Joseph Morizio, to compel him to restore $3293.02 collected by him.

Comment.

The closing down of the Temescal tin mine at Cajalco hill, San Bernardino county, which occurred last week, has not been unexpected. The mine has not borne out the promises of its owners. People familiar with the mine and not interested in its sale, were certain that the English investors would never get their money back. The mine was sold for a high price and a great deal of money has since been expended upon it. The tin ore was found in pockets and was by no means as abundant as the buyers had been led to believe. During the past thirteen months the mine has only yielded 150 tons of ingot tin worth about $70,000. The investment was $2,000,000, and the monthly pay roll about $15,000. Some delay in the payment of wages caused the men to strike last week and all work has been stopped. It is not all likely that this is the final closing of the mine, since with so large an investment the owners will be certain to give the hill a very thorough prospecting. It is of course possible they may come upon a deposit of ore which will pay to work better than the ore thus far found. It is unfortunate that this property has been taken as a subject of political agitation, owing to tariff questions regarding tin and tin plate. There is no duty on pig tin at present, so the product of the mine had no real bearing on the question. But one party having seen fit to make a great fuss over American tin, the other took occasion to try and prove that this mine amounted to nothing. As this was the only tin-producing mine in the United States, those in the Black Hills of Dakota turning out nothing as yet, the failure is likely to be heralded abroad to the detriment of the real mining interest of the State. It is greatly to be regretted that thus far the mine has failed to come up to the buyer's expectations. When the election is past the politicians will let the mine alone. Then, doubtless, the company will regain courage and renew operations in search of paying deposits of ore.

The Executive Committee of the California Miners' Association were wise in postponing the date of the annual convention until after the date of the Presidential election. The association is nonpolitical in character, and it is not desired that politics shall be brought into it. There was some danger of this, however, and by postponement this will have passed away. The hydraulic miners are satisfied that during the next session of Congress some sort of bill for their relief will be passed. Probably it will be the amended Caminetti bill, which will permit them to run their mines provided they can restrain the debris. Under present circumstances, they can be enjoined even if they build dams and keep the debris back. The opposition of the valley counties to the building of dams will scarcely amount to much, since their position now is a dog-in-the-manger one, with which few sympathize.

The new lighthouse tender, Columbine, has started from Cleveland, Ohio, to Portland, Oregon, by way of the great lakes, the St. Lawrence river and Cape Horn. It will cost $6000 to get her to Portland, but the Treasury Department does not mind a little expense like that. There is talk, too, of the new steel tug built for the Mare Island Navy Yard in this State, and now in use at the Boston yard, being sent around here and taking the place of the condemned tug Ivy. As it will cost something like $6000 or more to steam here by way of Magellan Strait there is some serious thought as to whether it would not be better to expend that amount of money toward building a tugboat at the Mare Island yard. For the size of boat required the facilities are said to be ample, with few exceptions. The hulls, boilers and engines could be built here as cheaply as elsewhere. In fact both these vessels should have been built on this coast. The lighthouse tender could have been built at Portland where she is to be used: and the tug could have been constructed at Mare Island Navy Yard or in the shipyards of this city. If our Senators and Representatives in Congress would look after such matters a little, the Government officials would stop giving such jobs to their favorite builders, and be compelled to distribute such work over the country. We can build vessels as well and as cheaply here as they can in the East, and when they are to be used on this coast, should be built here. It is a useless expenditure of public money to pay for such long voyages, simply that some one near to the officials may have the contracts for hulls, boilers and engines.

Comstock Mining.

The returns from the Consolidated California & Virginia mine for the month of August, to which we alluded last week, indicate that ore worth $23.91 per ton at the mine cannot be worked except at a loss to the owners of the shares. The 4350 tons of ore extracted from that mine during the month mentioned was worth, according to car-sample assays, $23.91 per ton, or a total of $112,708.50. This ore netted the company, after deducting milling and transportation charges, $35,489.50, or about $8.15 per ton. It seems strange that while $3 free-milling gold rock can be made to pay elsewhere, $23.91 rock, going more than half gold, cannot be made to pay on the Comstock. Of course there is an explanation for this, and it may be divided under several heads:

First. The fact that the mills make such low returns. Formerly mills bought Comstock ores outright, paying the companies 65 per cent of the wagon or car-sample assay, and got their pay out of the 35 per cent they retained. In the Consolidated California & Virginia working for August, the mill company returned 61 63 100 per cent of the car-sample assay and charged $5 per ton for crushing, so the company is out $21,750, and the mill company got the 35 per cent residue besides.

Second. The cost of transportation is also an outrageous item, $1 per ton being charged for transporting the ore about 20 miles. When it is realized that the mines of the Comstock and the citizens of Nevada built the Virginia & Truckee Railroad and presented it to the gentlemen of porcine inclinations who now own it, the extent of the extortion can be appreciated.

The owners of this road can have very little real interest in the State or the mines when, in this time of depression and assessments on the Comstock, they refuse to reduce their bonanza-time scale of charge.

Third. Another outrageous charge is that made for water. The company which supplies the water for the mines and mills on the Comstock is owned by the same set of men who have made a success out of milling the ore from mines, while the mines themselves have had to be kept running by assessments on stockholders. The rules of this water company are peculiar and, one might say, slightly arbitrary. If a mine or a mill shuts down, the employees of the water company go right along charging up the water, and when the company concludes to start again the water company informs them that they cannot use the water until the back charges are paid up. If the mining company demurs, they are informed that if they do not like it they can get their water elsewhere. As there is no other water to be had the decision can be guessed.

Fourth. Then there is the nice little charge for wood. At Empire City it costs $5.50 a cord. Empire City is 20 miles away from Virginia City and Gold Hill, and when this $5.50 wood gets to those places the price is $9.00 per cord.

This advance of $3.50 per cord is due to the charges of this same Virginia & Truckee railroad. The timbers for the mines are all supplied on the same scale of overcharge. As these timbers are also furnished by this same ring, they do not economize on the charges, but take "all the traffic will bear," and the poor devils that own the stock can continue to pay assessments. The history of the balance of the material furnished the mines is the same one of plunder, overcharge and mismanagement. Superintendents who are paid fancy salaries spend a good part of their time in San Francisco, or in junketing trips around the country, relying on the influence of their mill-ring relations to keep them in place. It is a "go as you please" race as long as fools can be found to pay assessments. Under such circumstances, the man who buys Comstock shares is apt to commit financial suicide. If an ore body is found, the mill owners get the best part of it or eat it up in charges and poor work, and the shareholder is assessed to take it out. If they do not find an ore body, they assess him to do the prospecting work. Probably the best way to remedy these various evils is for people to refrain from buying the shares in Comstock mines while under the present system of management. If they keep their money in their own pockets, they at least know where it is. The mines could be made to pay very well if conducted by proper methods, but the existing conditions are very discouraging to all persons interested in the advancement of legitimate mining.

Foundry Notes.

At the Globe brass and bell foundry of Whyte & De Rome on Main street in this city, the castings for the bronze statutary for the New City Hall grounds are being made. They have been at work on the contract for six months past, and many of the figures are ready for cleaning and mounting. The central group, representing California, has been well cast, the figures being in parts. That of California stands twelve feet high. Besides the central group there will be two lesser groups, each eight feet in height, representing different stages of California's history, and two single figures representing industry and commerce. There will be also four panels. The firm has over two years to complete the contract. To undertake this work the firm had to put in a 10-ton crane and build a new core-oven, the largest in the city. These groups of statuary were provided for in the trust deed of the late James Lick, and will be placed on the plot facing Market street, in front of the City Hall.

At the Union Iron Works the principal activity is in the ship-building department, and a large force of men is employed on the battleship Oregon and cruiser No. 6. On the Monterey the turrets are being prepared to receive the large guns which recently arrived from the East. It is probable that either the battleship or armored cruiser authorized by the last Congress will be built here. The plans will be ready for inspection by the bidders by November 1st. The bids will probably be opened and the contracts let by January 1st. Including the 8000 tons of armor required for these two ships and for the completion of the other armored vessels building, these contracts will aggregate nearly $12,000,000, the largest ever given out by the department at one time. The armor contract will amount to about $4.500,000, and the construction of the two ships to about $7,500,000—$4,000,000 for the battleship and $3,500,000 for the armored cruiser. The Union Iron Works will bid on these vessels, and have hopes of at least getting the battleship. This vessel will be of 11,250 tons, which is larger than the three now building and will be given 11,000-horsepower engines.

Death of John T. Evans.

The numerous friends and acquaintances of John T. Evans, the well-known analytical chemist and assayer, will be pained to hear of his death which occurred at his residence in Alameda last week, after a short but distressing illness. With the mining community, also, the death of this gentleman will be deeply deplored, he having been in his professional capacity well and favorably known throughout the mining districts of California.

John T. Evans, who was a native of Wales, came to this country when very young, stopping first in Wisconsin where he obtained a liberal education and spent his early manhood, having had charge of the Rippon College before he left for California. About the year 1872 he came to this State and entering the metallurgical and chemical department of the City College, then under the supervision of Prof. Thomas Price, there remained a pupil for several years. So well did Evans perfect himself in these branches that Prof. Price, a few years later, employed him as his chief assayer and chemist, which place he held until two years since, when he engaged in this line of business on his own account, connecting therewith a school for teaching assaying.

Mr. Evans was a very skillful man in his profession and enjoyed the confidence of all who had any business with him. He was conscientious and thorough in everything he undertook and was always a close student in those departments of science in which he was interested.

During his life Mr. Evans occupied many positions of responsibility and honor, having been at one time vice-president of the Academy of Sciences in this city, and of which he was still a member at the time of his death. He was also secretary of the Cambrian Mutual Aid Society. He belonged to the Ancient Order of Foresters, to the American Chemical Association, and to various other scientific or benevolent societies.

Coast Industrial Notes.

THE new electric street railway in San Diego was formally opened on Tuesday of this week.

THE fishermen of Seattle have formed a union with nearly three hundred members, which proposes to regulate the price of fish.

SUPERINTENDENT J. J. Moynahan of the Gem mine, Coeur D'Alene, Idaho, is in this city looking for miners to send up to the mine.

SEVERAL cigarmakers have been set to work by the San Felipe Havana Tobacco Company of Gilroy, making up the Culp plantation tobacco.

THE manufacture of orange oil, which sells for $7 a pound, is coming to be a leading industry of Riverside. It is made from the peel of the fruit.

THE trail cars of the Oakland Consolidated Electric road are being changed into motor cars. The new observation cars recently received are now ready for service.

WORK on the Bakersfield and San Miguel railroad is being steadily pushed, and the moving end is now completed to a point about forty-three miles distant from the Sumner depot.

THE Oakland Consolidated Street Railway Company has filed an application with the City Council for an electric street railway franchise along Center street, from Sixteenth to First, on Eighth from Grove to Franklin, and along West street, from Eighth to Market street.

THE Sacramento City Trustees have ordered a special election for October 13 h, to vote on $100,000 city bonds for levy improvements, the idea being to so strengthen and raise the city's levees as to make them absolutely impregnable and make further expenditures unnecessary for many years.

THE paper mill at Lowell, Wash., has turned out the largest rolls of paper ever manufactured in the world. Each roll weighs 3600 pounds, and if unrolled the paper in each would make a strip thirty-five miles long. They were taken to Tacoma to be placed on exhibition, and will be sent to the World's Fair.

A PRIVATE telegram from San Francisco received in Grass Valley, announces that the arrangements for the organization of the company to introduce electric power from the South Yuba river to Nevada and Grass Valley mining districts have been perfected and the money for the enterprise secured. The work of construction will be commenced this season.

THERE is a rumor to the effect that the United Verde Company will put up a plant at Jerome, Arizona, for refining. Should such action be decided on, it means the expenditure of $200,000 in the near future at that camp. The contractors for the bucket line over the mountains to this property, have been compelled to change the line, but are confident of ultimate success.

MR. COLQUOHON, of Golden B. C., has obtained the necessary ore-crushing appliances and is now treating ore by the cyanide process. From experiments which have already been made, it appears that the cyanide process is well adapted to the refractory ores of the Province and as there are so many of this character there should be a great future before the patentees.

OVERLAND shipments of produce and merchandise from Northern and Central California via Southern Pacific lines in August were 45,860 tons, against 30,428 tons in August, 1891. This is a tremendous increase for this year. The shipments were as follows: From San Francisco, 18,916 tons; Oakland, 1268 tons; San Jose, 3730 tons; Stockton, 3559 tons; Sacramento and East, 16,374 tons; Marysville, 1536 tons; Portland, 477 tons.

THE Holmes mine at Candelaria (Nev.) has not been started yet, although everything is in readiness to do so when orders are received from London. The Mt. Diablo mill is running to its full capacity, and the ore is keeping up to a grade which insures a small profit. The times are not propitious for any excitement in a silver camp, and those that can run along through the prevailing dullness in the bullion market are doing very well.

RECENT purchases of thirty acres of land at Fitchburg, east of Fruitvale, Alameda county, are said to be for the Southern Pacific, and that the company will extend its local train service to that place and construct a loop 1200 feet in diameter, round which the trains will run in order to avoid changing the engines from one end to the other at the terminus. The construction of the new electric line has probably caused the Southern Pacific to extend its local service.

J. W. HARTZELL has filed with the Council of Santa Rosa an application for a franchise to put in a new system of water works. He is at present building the water works at Ukiah. His plan is to bring water from the Russian river, fourteen miles. Wells are to be sunk on the banks of the river, and the water piped to a reservoir on an elevation near town sufficient to give a pressure of ninety pounds. It is claimed that it will cost $50,000 to bring the water from the river to the reservoir.

SAN DIEGO wants its own waterworks, and the committee of the Council recommend that a special election be called at once, submitting to the voters of the city the issue of bonds in the sum of $665,000, for the purpose of constructing and acquiring a water distributing system for the city. The report is accompanied by the estimate on the cost of a new system of pipes, all of cast iron, as formulated by the water commissioners, and by the proposition to furnish water as given by the Flume company.

THE Butte (Mont.) electric light plant has been sold to the Silver Bow Electric Light Co., for $225,000. The purchasers are St. Paul and Boston capitalists and are members of the Thomson-Houston company. The deal speaks eloquently for the confidence reposed in Butte investments by eastern capitalists. The T. H. people acquire a first-class plant and a very lucrative business and the Butte owners of the old company realize a good profit on their investment, so the transaciton is advantageous to all concerned. There are only three stockholders in the Butte plant, W. A. Clark, P. A. Largey and H. A. D'Acheul

ON Monday September 10, the first stake was driven, and first work done in the construction of the San Luis and San Joaquin, or "East and West" railroad. Chief engineer M. M O'Shangnessy and Treasurer L. C. Branch of the S. L & S J. R. R. Co., arrived at San Luis Obispo by steamer from San Francisco, and with a corps of surveyors immediately went to the field of operations. This record is made as the commencement of operations the most important for the future prosperity of San Luis Obispo county ever undertaken within its limits. It is expected that this work will be pushed to completion without delay throughout its entire contemplated system.

JAMES PORTEOUS of the Fresno Agricultural Works has just completed and shipped from Fresno to Spain, by way of New York, two of the latest improved raisin stemmers of the largest size, with a capacity of from five to seven tons each per day. The same shop has made stemmers for the Australian market, and has successfully competed in that field. It had scarcely been expected that this young city, only a few years old, and scarcely past the experimental state so far as the raisin industry is concerned, would be able to teach the Spaniards how to stem raisins and furnish them the machinery to do it with, when Spain has been in the raisin business from time immemorial. But all these things have come to pass.

GEORGE M. HARRIS received a franchise recently to construct an electric railway and erect a light and power plant in Phœnix, A. T. He has enlisted $300,000 of Denver capital for the enterprise. Granville Malcom, Judge Lindell, James Russell of Denver and James R. Fleming are the principal stockholders. The franchise compels the company to furnish fifty sixteen-candle incandescent lights to the city free, and all additional lights for the city 20 per cent off. Considerable business already awaits electric power, as the water pressure is insufficient. As a corollary to the enterprise, the company proposes a hotel costing $300,000, to be erected at the north end of the electric line, outside the city limits, as a winter home and sanitarium.

MESSRS. Stebbins & Porter, miners and millmen from Calico, have been making thorough tests of the MacArthur cyanide process at Reese's mill, below Havilah, Kern county, with astonishingly good results. It is reported that only a trace of gold can be found in any of the tailings after this treatment. At any rate, the parties are so well satisfied that a tank of fifteen tons capacity is now being constructed at that mill, and complete arrangements will be made for treatment of ores on a large scale. It is stated that Mr. Stebbins enthusiastically declares that any ore in the Havilah can be made to yield all but a trace of its gold by this treatment. If this be true, Havilah will become a flourishing mining camp again. The gold in these ores is very pure indeed, and heretofore there has been great difficulty in saving it.

PETROLEUM has been known to exist in the foothills and ravines back of Oakland for a great many years. There are indications of it on the waters of nearly all the springs and running streams near the city, but for some reason or other no boring has ever been done until recently. Now, the Ainsworths and their associates, of Redondo Beach fame, have begun prospecting in earnest. A number of wells are being sunk near De Laveagas Station, on the California and Nevada railway, about a mile beyond Wagner's ranch, and the indications are said to be very favorable for a discovery of oil. The strata being bored through are similar to the formation at Stockton where the gas wells are located, and similar to the ground bored through at Pleasanton about a year ago, where gas flowed for several weeks.

SURVEYORS have been, for some weeks, in the field planning the best route for the San Francisco and Santa Clara Valley railroad. Already, two preliminary surveys have been run. The starting point of both is the same, a location on the bay, opposite Mayfield. From there one survey runs through the town of Mayfield back to the base of the foothills, and thence along the warm belt to Saratoga, Los Gatos, and down through Coyote Pass to Gilroy. The other survey runs about a mile south of Mayfield to the foothills, and thence as in the first survey. Already, the company is said to have, in San Francisco, twenty-five miles of steel rails. As soon as the surveys are completed they will be considered, and that found to be the most advantageous will be adopted. The actual work of construction will then immediately be commenced.

PROTESTS continue to multiply against the application of the San Francisco and San Mateo Railroad Company, through Behrend Joost, for a franchise for electric railroad privileges on many streets of the city. Residents in the neighborhood of Holly Park are strongly objecting to the granting of a franchise for tracks on the two blocks of Mission street between Thirtieth and French streets, and also on Arlington and Charter streets. It is claimed that the application is not made in good faith, but simply to hold the streets indefinitely in order to prevent competition. Property-owners on Clarendon heights particularly object to the granting of a right of way between Ashbury and Eighteenth streets and the park. It is said that Joost has already secured from the last Board of Supervisors a franchise which enables him to reach the park.

THE owners of the British bark Martha Fisher, last year, being unable to get a return cargo at Victoria, B. C., decided to take a load of Alaska guano to England, thinking it would be sold as easily as the guano obtained from the southern islands. The bark was loaded and arrived in England, but the guano did not meet with the favor expected; in fact, the experiment was far from a success. Captain Meadowcraft, who was present when the hatches were lifted, says that the smell would cure the influenza with one sniff. After the cargo had been discharged, no one cared to handle it, and when the Martha Fisher left Liverpool last February it was still in a heap, and was for sale at the purchaser's price. Even if the guano had been sold, there would not have been much profit left for the owners, as after the bark was discharged it took the crew a couple of months to clean her.

THE site for the dam of the electric power company which is to furnish power to the mines and mills of Grass Valley and Nevada City, is to be on the south Yuba river, about two miles above the Purdon bridge. The location will be at a point where the river narrows, and will be upon a rock foundation, making a secure footing for a dam, which cannot be carried way by any flood that may come into the river. It is the intention to have the dam constructed before the winter rains set in. When the dam is secured the canal will be commenced. This will be four miles in length. From the end of the canal the water will be dropped 380 feet to the bank of the river where the dynamo plant will be set up, and from which the electric power will be transmitted It is the expectation that the work will be completed and the electric power be ready for the use of the mines at an early date next Spring.

THE Santa Cruz Engine and Boiler Works have built a traction engine which has just had a trial trip. This engine is the invention of Mr. Orin Wait, Superintendent of the S. C. E. & B. Works, and was put up in these works under his directions and after patterns furnished by him. It is not only a traction engine, that is, a machine for hauling upon the common roads, but it is equipped for pile driving, sawing wood, crushing rock and every purpose of a stationary, portable or donkey engine. Its hauling capacity with its single engine is from twelve to fifteen tons, at say, a three mile per hour speed, which, of course, can be much increased by making it a double-engine machine. The power is applied by the link belt which far excels the gear wheel. The speed of the machine when empty can be run up to five or six miles an hour. Its weight is five and a half tons, it having been purposely made small for a test and experimental machine—its size and power can be increased indefinitely. The wheels are six feet in diameter with a 14 inch face furnished with cleats. Its steering apparatus is of a new pattern and is handled very easily and the machine can be turned around in a space not greater than that required for a two-horse wagon.

Personals.

GEORGE D. ROBERTS has gone to Denver to buy machinery for a mine in New Mexico.

JAMES H. TIBBITS is superintendent of the Belmont mine, Sutter Creek, Amador county.

C. W. AYERS has been given charge of the department of mining exhibits at the Portland exposition.

T. G. DIVINING has been reelected superintendent of the Gray Eagle mine, Forest Hill divide, Placer county.

PHELPS, DODGE & Co. are succeeding with their new leaching process, at the Copper basin mines, Arizona.

F. H. HUFF has brought to Salt Lake what he thinks is tin-bearing ore from a find recently made near North Ogden.

J. T. BREEDEN has relocated a promising ledge near Mount Sterling, Jackson county, Oregon, about twenty miles above the Little Anaconda.

THOMAS EVANS, former superintendent of the El Dorado Water and Deep Gravel Mining Company, who has been on a visit to Wales, has returned to Placerville.

GEORGE MCINTYRE, discoverer of the district which bears his name, near Boise City, Idaho, has sold an interest in several claims to George Clark. The mines are on Picket Pin creek.

E. HUHA, Carl Whily, W. Bentz and B. Brommell of San Francisco, stockholders in the Odin mine, have been up at Nevada City looking at the property. They are getting into good gravel.

A. J. SHOTWELL and E. M. Albertson, of Boulder Colorado, are inspecting the mines in and around Mineral Park, Arizona. They will remain in Mohave county the greater part of this fall and winter.

MESSRS. N. BRALNOBER and S. Wartenweiler of Montana, are interested in a mining deal involving the great La-Bellevue or Cabell mining property in Granite district, Oregon, and have recently been visiting the mine.

ROBERT J. DEVLIN has a contract for $200 per month with Sacramento county to prosecute hydraulic miners. The contract will expire in a few months, but it is probable he will be employed in the same work by the new Anti-Debris Association.

THE San Francisco Microscopical Society gave a reception to Prof. Joseph Le Conte of the University of California on Wednesday evening. Prof. Le Conte has been abroad for the past year and has just returned to his duties at the University.

LUTHER WAGONER, the mining engineer of this city, is now in charge of the Washington Reduction Company at Conconully, Okanogan county, Washington. The new reduction plant has just been started up. Mr. Wagoner is in charge of a force of sixty men in mines and mill.

C. H. AKERS, who came to Prescott, A. T., from the Hillside mine the other day, says that Superintendent Rickard has been experimenting with the treatment of the ore by the cyanide process, and has succeeded in obtaining a very large percentage of the metal at a cost of $3.00 per ton. A large plant will soon be placed at the mine to treat the ore, the machinery for which is already en route.

ZINC shavings found in the cyanide process cost fifty cents per pound if ordered from the agents of the MacArthur, Forrest Co., but can be made at the works of any one at the expense of fifteen cents per pound.

THE California Association of Civil Engineers has elected the following named as its officers for the ensuing term: Hubert Vischer, president; C. E. Grunsky, vice-president; Directors—George F. Allardt, William Ham Hall, James D. Schuyler, S. Harrison Smith, E. E. Tucker.

Safety Lamps for Mines.

A Comparison of the Different Forms in Use.

The main difficulty in establishing a reform in the use of safety lamps in gaseous mines is in the attitude of many miners.

In Great Britain, nothing short of legal enactment forced the Davy and Clanny lamps to the wall and secured the adoption of better and safer types. It will require the same action to secure the adoption of hetter lamps in this country. The miner whose father and grandfather worked with a Davy, in most cases, helieves it to he the *only* safety lamp, and he refuses to use any other. Repeated attempts have heen made hy mine owners and mine managers to secure the adoption of improved lamps at their mines, and these attempts have been frustrated hy the miners positively refusing to use the lamps offered. The Lehigh Valley Coal Company purchased, in Decemher last, twenty-one Evan Thomas' No. 7 lamps. They were shipped to York Farm colliery, and their merits and advantages were explained to the men, hut they refused to use them. Years of practical experience have proven heyond a doubt that the Davy, the Geordy, and the unbonneted Clanny lamps are unsafe in gaseous mines, and the British Royal Commission on Accidents in Mines has officially condemned them.

The most important requirements of a safety lamp are: (1) Safety in strong ventilating currents. (2) Greatest susceptibility to the presence of gas. (3) Good illuminating power.

The lamps which most nearly meet these requirements, says the *Colliery Engineer*, are Evan Thomas' No. 7, the Mueseler, the Marsaut, the Marsaut with Howat's deflector and movahle honnet, and the Ashworth-Hepplewhite-Gray lamps. The Evan Thomas lamp is a honneted Clanny, and has proven a most efficient lamp. It gives a hright, steady flame, and will not pass the flame in strong currents. It is not easily extinguished by heing upset, nor under any ordinary conditions. Inside the hottom of the bonnet is a hrass ring, one inch high, surmounted hy a flange, which extends nearly to the bonnet. All the air passes through hetween the hrass flange and the bonnet, and thence down on the flame. The products nf combustion escape up the center of the gauze to the top. Tests with this lamp have heen made in an explosive current with a velocity of fifty-three feet per second. The gas continued to hurn in the gauze cap, and a portion of the gauze quickly hecame red hot, hut its temperature was considerahly helow that required to ignite the gas mixture. The lamp flame was in all cases extinguished in the gas mixture in a few seconds, and after an exposure of over seven minutes it showed no signs of danger. In this lamp, the quality of safety, in a preeminent degree, is comhined with simplicity of construction, and with illuminating power at least fully equal to that of any of the lamps hitherto in general use. The British Commission, in summing up its opinion of this lamp, says: "This lamp seems very safe in all currents in which it was tested. In air moving with any velocity up to 3500 feet per minute, the flame hurns very steadily when the lamp is either erect or inclined. The flame is scarcely affected by violent oscillations of the lamp or hy rapid motion up and down in a vertical direction, and it is not extinguished by inclining the lamp until the latter is nearly horizontal."

The Mueseler is on the same principle as the Clanny. There is a thick glass cylinder around the hottom part of the lamp, and this is surmounted hy a gauze cylinder. Upon the top of the glass is a ring of gauze, through the center of which a conical metal chimney is passed. The wider end of this chimney is placed just ahove the flame, and all the products of combustion ascend through it. The idea of the chimney is to compel all the feed air to come right down on the flame. It has heen found that when placed in an explosive mixture, the gas ignites inside of the glass cylinder, and as the gauze disc on top of the glass cylinder prevents the gas in the upper chamher of the lamp from being ignited, all the combustion takes place below, and the flame is either speedily extinguished, or, if it continues to hurn for any length of time, the glass cracks. If the Muesler lamp is accidently upset—which often occurs—it goes out immediately. The light given hy it is hetter than that of the Davy, Geordy or Clanny, and it has heen known to hurn in a current with a velocity of 100 feet per second without passing the flame through the gauze. It is not, however, safe to use it in such a current. The Marsaut lamp is largely used in Great Britain. It has a glass cylinder the same as the Clanny lamp, and this glass is surmounted hy either two or three gauzes, one inside the other. The two-gauze lamp gives more light than the one with three gauzes, hut there is more likelihood of the flame passing through a double gauze than through a triple one, in a current of great velocity. This lamp is honneted with sheet-iron, and it is apt to hecome very much heated if left standing at a working face where there is only a moderate current of air circulating, as the gases formed by comhustion strike against the honnet, which is in good metallic connection with all other parts of the lamp.

In all the lamps described, a certain portion of air finds its way into the upper part of the lamp without first going down to the flame. An improvement, known as Howat's Deflector, has recently heen added to the Marsaut lamp, which compels all the air to go down directly to the flame. About an inch above the glass, and over the point where the feed air enters, is a flanged ring filling up the space hetween the honnet on the outside and the gauze. A vertical ring rests on the glass, reaching up nearly to the flanged ring. The cold air, striking against the flanged ring, is deflected over the lip of the vertical ring down on to the flame, and none can pass into the upper chamher of the lamp. This deflector does not affect the safety of the lamp in any way, hut it increases the light, so that a Marsaut lamp with Howat's deflector attached gives more light than any other safety lamp. Another desirable feature in this lamp is the movahle honnet, which permits the lamp to he cleaned.

The Ashworth-Hepplewhite-Gray lamp posesses peculiar advantages as a lamp for fire-hosses. In principle it differs somewhat from those previously described. The air is fed from the hottom of two of the four standards which support the lamp, through holes in the sides of these tuhular standards. These holes can he closed, if desired, and the supply of air forced to enter at the top of the lamp, and pass down the four standards, to the flame. This lamp has a conical-glass and a flat wick, and gives a good light.

Careful research has demonstrated that in the construction of safety lamps, the hase of the gauze should he of exactly the same diameter as the glass cylinder, on which it rests, and for ordinary working at the coal face, those lamps which get their supply above the flame are preferahle to those (such as the Ashworth-Hepplewhite-Gray lamp) which are fed helow the flame. The reasnn for this is, that it requires a larger percentage of gas in the atmosphere of the mine, to show in the lamp which receives its air on the top of the flame, than in one which gets its feed air from under the flame, and if a lamp is too susceptible in ordinary working, it will rapidly heat the guaze to a degree that will cause an explosion.

The question of the illuminating power of a safety-lamp is, as mentioned hefore, of great importance. All of the lamps described are hetter light-givers than either the Davy, Geordy, or Clanny. A candle to have an illuminating power of one or unity, it has heen found by test that the Davy has an illuminating power of but 0·16; the Geordy of hut 0·10; the Clanny of 0·20; the Mueseler of 0·35; the Evan Thomas of 0·45; the Marsaut with three gauzes, of 0·45; the Marsaut, with two gauzes, of 0·55; and the Howart's Deflector of 0·65.

Another important thing to consider is the relative merits of those lamps as fire-damp detectors. Of the three old types, the Davy is the most susceptihle to fire-damp, and will show a cap of hurning gas of bluish color over the flame, when three per cent of marsh gas is present, The Muesler, Evan Thomas, Marsaut, and Deflector lamps are about alike in point of sensitiveness, and are not good fire-damp detectors. The Ashworth-Hepplewhite-Gray lamp is *par excellence*, the hest detector. In its ordinary shape it it will show a cap in a mixture of only two per cent. of gas.

The Pieler lamp, which is used exclusively for testing purposes, is practically at large Davy lamp constructed to burn alcohol, with an argand or open circular wick. The air is supplied to the inner part of the flame and enters from the bottom hy a tuhe (the opening of which is protected by discs of gauze) which passes vertically through the vessel containing the alcohol. Around the flame is a short conical chimney, open ahove and helow, and the flame is so regulated that it does not appear ahove the chimney, the height of which is from 1 to 1¼ in. The lamp is encased in a tin cylindrical hox, from which a section is removed, and in which a graduated strip of glass is fixed.

While this lamp is somewhat more sensitive than the Ashworth-Hepplewhite-Gray lamp, it is not as good for the use of fire-hosses as the latter.

It is ohvious to all who have given the question of safety-lamps serious study that the safer the lamp, the poorer a detector it is. Therefore the lamp for use at the working face should not he judged so much on its ability to detect gas as on its ahility to prevent the flame in the lamp reaching the gas outside the gauze; and the lamp for the fire-hoss should he judged on its sensitiveness comhined with such a degree of safety as will render it safe when in the hands of an official whose chief duty is to *watch it*, and who naturally devotes more attention to its behavior than is possible for a working miner to give his lamp.

The main, and only reasonahle objection offered hy miners, to the use of these lamps, is the fact that they are heavier than the Davy.

The same objection was raised against the use of these lamps by the miners of Great Britian. The experiments, researches, and investigations made hy the Royal Commission on Accidents in Mines, furnished conclusive proof of their superiority, and the dangers attending the use of the old types of lamps. The result was that a long and hitter contest was waged over the safety-lamp question, which finally resulted in a compromise, and the adoption of the following rule:

"Whenever safety lamps are used, they shall be so constructed that they may he safely carried against the air-current ordinarily prevailing in that part of the mine in which the lamps are for the time heing in use, even though such current should be inflammahle." This rule has resulted in the abandonment of the Davy and Clanny lamps in many British colleries and the addition of shields to protect them in the others which still cling to their use.

In the Bradshaw Mountains, Arizona.

OLD RELIABLE MINE, Ariz., Sept. 4, 1892.

TO THE EDITOR:—The Old Reliable group of mines is about 31 miles from Prescott, A. T. It is situated in the Bradshaw mountains, 7800 feet ahove the sea level, where there is an abundance of wood and water. Water is secured hy a pipe-line 1300 feet long. The mill runs steadily, while within a radius of 20 miles the mills are closed down on account of the scarcity of water. A force of men is working on the Old Reliahle mine under the foremanship of P. J. Hiffle, a thorough and competent miner.

Jas. R. Liston is manager of the Old Reliable Gold Works. He has had extensive experience in mining and milling in the northern part of California and all through Nevada. He has shown his ability and practical knowledge of mining by the splendid results ohtained. He has made several tests of the MacArthur Forrest or cyanide process. He saved from 90 to 97 per cent. It will he tried on a larger scale soon. F. J. GIBBONS.

ANTHONY GODBE reports that the Bullionville (Nev.) works will he ahout ready for the reduction of ores and tailings at the end of this month. The works are remodeled and simplified, and as arranged, can handle large quantities of ore and at small cost. The starting up of the plant is looked for with great intesest.

The Cyanide Process.

Cost of Working—Some Experiments with Sulphurets.

An interesting paper was read at the last meeting of the Shasta County Miners' Association hy Prof. Morton, superintendent of the Mammoth mine. A large number of memhers was present, and an important discussion ensued. The following is the paper as read hy Mr. Morton:

The discovery of cyanogen dates from about the year 1706, when Dieshach accidentally discovered Prussian hlue. Various improvements were made in the manufacture of the ferro-cyanide of potassium, hut up to 1811 its true composition and range of comhination was not understood. Then Gay Lussac showed that the salts obtained hy the action of prussic acid are compounds of cyanogen and a metal, and that it is an unvarying constituent of such compounds and is capahle of heing replaced hy equivalent quantities of other simple hodies.

Thus we find that even in the early part of the century the soluhility of the metals in solutions of cyanide was well understood. In 1839, C. V. Walker, secretary of the London Electrical Society, puhlished a work on "Electrotype Manipulation," in which he proposed using a cyanide solution of gold or silver. In 1840, Elkington obtained a patent in England for the use of prussiate of potash, meaning cyanide of potassium, however, as a solvent for gold and silver, the gilding solution to he prepared by placing sheets of gold in a solution of cyanide of potassium in connection with an electric current. In passing over the years from 1840 to 1884 we have to mention the continual use of cyanide of potassium as a solvent for gold and silver in all electrotyping works throughout the world. At times, other solvents were proposed and used, hut they were not adopted generally in the art. Tersulphide of gold has heen tried with excellent results, but, although at one time it was considered the cheaper method, still the stahility of the cyanide solution has rendered it the most reliahle and in every way the best solvent for the metal.

On Octoher 15th, 1884, Jerome B. Simpson of Newark, N. J., applied for a patent for a process for extracting gold and silver from their ores, disclaiming, however, any originality in the use of KCy. In 1886 Louis Janin, Jr., made his series of tests of the solutions of Cyanide upon ores of gold and silver, the results of which were puhlished in the *Engineering and Mining Journal* of Dec. 29th, 1888, which results were as good as any that have since heen given. On Nov. 9th, 1887, MacArthur and Forrest applied for a patent, virtually the same as Simpson's, which was not granted until May 14th, 1889. This, in hrief, is the history of the evolution of cyanogen in its metallurgical uses. I pass hy the merely tentative experiments of Faraday and Davy. We now come to the main question: Is the cyanide process a decided step forward in the metallurgy of gold?

To the entirely disinterested observer who will take the pains to examine the claims of the MacArthur-Forrest Companies and compare them with the progress really made in the United States, this question can only he met with a very decided negative.

Notwithstanding the claims for cheapness so industriously made, I find on page 20 of the annual report of the Denver Co. this significant admission: "We cannot profitahly conduct a custom mill in this city in competition with the extensive smelting plants," etc. If they cannot compete with smelting in Colorado, how are they going to get a foothold for their process in California, where the majority of paying ores carries less gold than would pay the most moderate smelting charge?

Mr. Almarin B. Paul, in his article of June 4th, published in the MINING AND SCIENTIFIC PRESS, places the actual cost of the treatment at from $2 to $5 per ton; add to this the royalty charge of $1 per ton, and it is evident that an ore must yield from $3 to $6 per ton over the yield hy the ordinary mill process before the use of this process will begin to give a profit to the mine-owner. To illustrate, referring to the Mercur Gold Co. of Utah, the statement is made, page 12 of the Denver Company's report: "This company will make payments on a capacity of 50 tons per day monthly hereafter." Let us assume that the cost of treatment by the process is $3 per ton, royalty $1, and the milling alone cost the Mercur Gold Co. $6000 per month (more than the ordinary mill process would cost). In the *Mining Age*, June 11th, the workings of the Mercur gold mine is given for May as heing 10½ sacks that netted $10,000. The product appears to have been in the form of zinc resldues that were sold to the smelting works. Now, as we have the cost of the process as given hy Mr. Paul and also by the Denver Company and the yield of the mill as given by the PRESS, we can get some idea of the amount of success that this, the most successful, if not the only successful, mill of this kind in the United States is meeting with.

Allowing that it will cost $3 per ton to mine and deliver the ore to the tanks, $3 per ton for the process expenses and $1 per ton royalty, we have a total cost of $7 per ton. In support of my deduction here made, I quote from page 12 of the Report of the Denver Co.: "We have made a contract with the company to pay us a royalty of $1 per ton on all ore treated hy them; so far we have received the sum of $2000 to he credited to royalty, etc. This company will make payments in a capacity of 50 tons per day monthly hereafter." Now, if this is all true, the Mercur Co. produced in May $10,000, out of which it should pay the Denver Company $1,500; say that their expenses were $6 per ton on 1500 tons, or $9000, the result would he a net loss of $500 cash and 1500 tons of ore as the result of the month's working hy the process.

Continuing further in this interesting report, I find on page 13 that Mr. James Duggan has arranged for the erection of a 100-ton mill in San Bernardino county, and that the Denver Company are to receive $10,000 for the county right and $1 per ton royalty on all ores treated by the process throughout the county. This mill was to have been erected at The Needles. Here was to have heen a perfect

bonanza for the Denver Company, but alas, the mill closed down after an unsuccessful run and the company will now adopt another process.

On page 14, they claim to have sold the right to the Black Hills for $25,000 and $1 per ton royalty. On page 15, they refer to a contract with Alexander Bonham by which he is to pay a royalty for the process in Boise Co., Idaho, of $10,000 and $1 per ton on all ore treated by him. Wealth, like a boundless sea, appears to be flowing in upon the fortunate Denver Co. In additinn to their own plant in Denver, five subsidiary companies were organized, and some dozen establishments licensed at prices varying from $5000 to $25,000 for county or district rights, besides the inevitable $1 per ton royalty. No matter who loses, the company has nothing to lose but everything to gain. Though they have a capital on paper of $5,000,000, it does not appear that any one has ever paid a single dollar for the stock. Of the total expense of $57,000 up to April 30th, $21,700 was obtained from the Tabor Investment Co., $20,000 from Glasgow, Scotland, at eight per cent interest, and $15,300 from county rights, royalties, etc. Still they exact their pound of flesh in the way of exorbitant charges, notwithstanding the fact that their patents cover nothing; only the use of a weak solution of cyanide, whatever that is, and a metallurgical filter composed of zinc filaments. Will some gentleman please invent a weak solution of tea to compose the nerves of fidgetty females!

But brushing aside as foreign to the subject the noisy claims of the MacArthur crowd, let us see what cyanogen is and if it is probable that it may be used as a metallurgical system.

Roscoe says, employing Liebig's classical definition: "We may say that cyanogen is a radical because:

"1st. It is an ever-varying constituent in a series of compounds.

"2d. It can be replaced in these compounds by other simple bodies.

"3d. In its compounds with a simple body, this latter may be easily separated or replaced by equivalent quantities of other simple bodies."

Cyanogen, to which the symbol Cy instead of the formula C. N. is sometimes given, combines, like chlorine, with hydrogen, and the metal and its compounds may therefore be compared with those of chlorine thus:

Hydrocyanic acid, CyH, matches hydrochloric acid, CLH.

Potassium cyanide, CyK, matches potassium chloride, CLK.

Potassium cyanite, CyOK, matches potassium hypochlorite, CLOK.

Free cyanogen, Cy2, matches free chlorine, CL2.

We have here the chemical basis of a possible method of obtaining gold from its matrix. It is settled beyond question that gold is soluble in solutions of cyanide of potassium; it is also certain that its solubility is increased by the action of an electric current. However, it is not yet known how far the presence of the base metals and soluble salts interfere with the operation but I feel certain that they do interfere sometimes to an extent that renders the cyanogen impotent, at least in a commercial sense.

Upon the ordinary auriferous sulphide of iron, or arsenical pyrites, the solution of CyK acts readily, not by dissolving the sulphuret but by attacking the gold upon its exposed edges and eating its way into the cubes by a slow advance, dissolving out the gold as it goes. An examination, with the microscope, of the pyrite after the gold has been removed, suggests the method of the operation. A sample of very rich sulphurets from a mine north of Redding was treated with a weak solution, less than two-tenths of one per cent, for 168 hours; the assay showed a complete extraction of the gold; as the sulphurets showed no change in their appearance to the naked eye some of them were placed under the microscope. I append the notes made during the examination:

"There is no change visible in the form of the crystals as a whole; along the fractured faces the mispickle looks clean and unaltered, showing the silvery white color and intense refraction of the arseoo-pyrite. Upon the faces of the crystals appear dark lines, short and parallel to each other, in places they are crowded close together; in other parts they are at considerable distances but always in parallel lines. The lines vary in length, being from four or five times to over 100 times their width; the lines are very irregular and often broken. These lines are fissures in the pyrites and extend so deep into the pyrite that the microscope does not reveal their depth. By using the higher powers the walls of one of the fissures was seen to be completely honey-combed, looking somewhat like two empty honeycombs set opposite to one another; evidently the mineral removed was crystallized along its contact walls at least. As the raw or untreated pyrite does not show any such fissuring, but upon the contrary, shows a surface marked only by striation lines common to pyrite, I assume that the fissuring in the treated sample is caused by the solution acting upon some soluble mineral, probably gold, arranged in plates, occuring in groups, but which, by its color and isomorphism and the extreme tenuity of its lines, is undistinguishable from the mass of pyrite enclosing it."

Another sample from a mine west of Redding exhibited the same general appearance, with the exception that the cavities were cylindrical and arraoged in groups; the cavities did not show any honey combing but were crossed by thin crystals of quartz. The walls of the cavities were bright pyrite.

The object of these examinations was to find out in what way the cyanide had removed the gold from an apparently unchanged pyrite. In conducting my experiments I have found a considerable quantity of the gold carried out with the soluble earth salts in the preliminary leach with clear water.

The first experiment was upon a small lot leached for three hours with clear water; the water evaporated and the salts collected. These salts assayed $310.08 per ton.

The next ten pounds of ore, fresh from the mine, gave from a three hours' leach 48 3 10 MGS of gold and silver, in which the gold weighed 22 1-10 MGS.

The last made, Sept. 1st, gave from ten pounds of ore after a three hours' leach, still using only plain water, an extraction equal to 49 cents per ton of ore.

This is a subject to be investigated much further. Perhaps I have indicated some line upon which investigation of the subject of gold extraction from our sulphureted ores may be carried on. I believe that cyanide of potassium is an effective and reliable solvent for gold under proper conditions, and that it is equally as efficient and applicable to a wider range of ores than chlorination. I do not, however, believe that it is applicable to all ores without some previous treatment by which the minerals which combine with the cyanogen shall be either removed or combined with some other element that will render them inert, just as magnesia compounds are rendered inert to chlorine by the addition of salt in roasting.

In view of the intelligent interest now being directed to this subject we may feel sure that a solution of all these questions will speedily be found, and that cyanide, as a metallurgical method, has come to stay. To be sure, many failures will ensue; the process will be adopted to work many mines, the ores of which do not contain sufficient metal to pay with any process, and people will undertake to work the process that have not the slightest knowledge of the subject, nor the skill or industrious patience that is necessary to success in any metallurgical work.

Steam on the Highway.

Peter Chalmers, a farmer of Farmington, is a genius in his line. When anything new comes out he studies to see whether it cannot be adapted to use on his farm.

For one thing, he has applied helmet oil-cups to greasing wagon-wheels. He has a score of grain-wagons, all of them supplied with these cups, and all of the wheels can be greased by means of them in ten or fifteen minutes—a job which would require an hour or more without them.

All the plowing done on Chalmers' big ranch is done with a traction engine, and during the last plowing season he ran the engine day and night, having three shifts of men. A locomotive headlight was employed to illuminate the path ahead, and another was used to throw light on the plows.

Now the farmer is hauling wheat to town with his engine. He brought a load in yesterday and stored it at the Stockton warehouse. There were nine wagons in the train, and each carried sixty-eight sacks of grain. Each sack weighs on an average 137 pounds, so each wagon-load was 9,316 pounds, and the aggregate of all the wagon-loads 83,844, or nearly forty-two tons.

The farmer has 30,000 sacks of wheat to haul, some of it belonging to neighbors.

"Is it much cheaper to bring the wheat in this way than it would be to ship by rail?" asked a *Mail* reporter of Mr. Chalmers.

"Well," was the reply, "I can't say positively that it is any cheaper at all, but I think it is. You see, this is only my third trip, and I haven't been able to cast up accounts yet. The wheat I'm bringing now comes from near Farmington, which is seventeen miles from Stockton, and it would cost $1 10 a ton to get it here by rail. Some of the wheat I'm going to haul is farther away, and to transport it on the railroad would cost $1 50 a ton. I don't think it will cost me a dollar a ton on the longest haul."

"Where does the saving come in?"

"Well, one has to load his wheat anyhow, and if ships it by cars he's got to unload and then load it on the cars. That requires men and time. This way all we've got to do is to load it in the field—the warehouse men do the rest. It requires only three men to take care of our train—an engineer, a fireman, and a man to look out for the wagons and see that they don't get 'hot boxes.' The only expense of hauling, therefore, is the wages of the three men and the cost of the coal used."

"But," said the reporter, "there's the interest on the money in the engine, which cost——"

"Four thousand five hundred."

"——And then there's repairs and the steady wear of the machine; and you've got to have a lot of money invested in wagons—you would only need a couple of wagons to haul to the railroad, but this way you need a dozen."

"Oh, I need the wagons and the engine on the farm, anyhow," was the reply.

In further conversation Mr. Chalmers said it would not be feasible to haul grain as he is doing except on level and good roads. The only trouble he experienced was in crossing small bridges, which he had to brace up on the first trip. The tender carries water sufficient for only twelve hours' consumption, but water is pumped into it from watering-troughs along the road.

It might seem foolish to say that the wagons follow one another around corners in the same path, since as a matter of course they would do so, but people often ask the farmer what sort of gearing he puts on his wagons to make them follow the lead.

The engine can haul the train at the rate of four miles and a half an hour, but to prevent jolting the speed is regulated to about three miles an hour.—*Stockton Mail.*

MR. GEORGE ATTWOOD and Mr. Reynolds of London have bought the Rattler mine and mill at Fairview, B. C., and also the Brown Bear, Ontario and Wynn, all gold properties. The gentlemen will now go to England, and, on their return, in a couple of months, will build reduction works on the properties. They have already secured land on the Okanogan river for mill sites, etc. Mr. Attwood is the son of Melville Attwood of this city, and is an experienced mining engineer, having "experted" on mines in all parts of the world. The Rattler mine belonged to Fuller, of Hannah & Fuller, Spokane, O. M. Dutton, Hank Mankin and C. C. Carr. D. A. Carmichael owned the Ontario, Joe Bromley and George Wilkinson the Brown Bear, and the Wynn M. was located and owned by Harry Simpson.

Assaying a Gold Brick.

About 9 o'clock in the morning two men entered the Mitchell building, on Third street, St. Louis, and, getting into the elevator, mounted to the sixth floor, and went straight to the rooms of the United States Assay Office. One of them carried in his hands a bundle the size of a thin brick, wrapped in paper. He laid it down on the counter in the office and slowly unwrapped the bundle. It was a gold brick. The clerk took the bullion, and, stepping across the floor, placed it in one of the pans of a large pair of scales. Then he closed the office windows and placed some weights in the other. When it balanced nicely he went to his desk, took out a blank form, and wrote to the effect that 400 ounces of gold bullion had been received from the St. Louis Smelting and Refining Works, at the United States Assay Office, to be assayed. This was signed by E. C. Jewett, the assayer in charge, and the men went away. This is the first step the government takes toward obtaining precious metal for coining purposes

It is extremely interesting to follow this process of assaying through all the steps until the value of the gold is determined and the government's check given for it. Through the kindness of Assayer Jewett, a *Republic* reporter was allowed to witness it.

While Clerk Rex was filling out the receipt Mr. Jewett explained the marvelous delicacy of the scales. Their weighing capacity is 5000 ounces, and it is possible to indicate by them a difference in weight of one gramme. To illustrate, so that this may be easily grasped, two heavy men could be placed in one of the pans, and by removing a pin from the coat of one of them the balance would be changed. Still, it would be difficult to obtain the exact weight of the men, owing to the constant change in men's bodies by perspiration and other causes.

After the bullion's weight was determined on these scales it was taken to the furnance room and placed in a black-lead crucible. This was set on a firebrick resting on a grate and a fire built around it. The fuel used is a mixture of anthracite coal and charcoal. After an hour's melting, during which time it was frequently stirred with a plumbago poker, to which gold does not cling, a sample of the metal was dipped out with an ordinary clay pipe and poured into a small mould. The assay is made from this, as it takes so much longer for a larger quantity to cool. A piece of the sample was cut off, pounded, and then rolled through a roller of tool steel, looking something like a clothes wringer, to make it thin. When this was done, Herman, the German who aids the assayer in his work, handed the thin golden strip to him, and then went back to the furnace-room to pour out the molten thousands into the big mould.

Mr. Jewett cut the strip into small pieces, and then forming little lead cornucopias of uniform weight, dropped into two of them 500 milligrammes (one-sixtieth of an ounce) of accurately weighed gold to be assayed. Into two others he put the same quantity of absolutely pure gold. Enough silver was then added to make the proportion of silver to gold two to one, as this proportion is necessary in order that the gold should separate from the silver when boiled in nitric acid.

There is in all gold a certain amount of silver and it is owing to its presence and certain other foreign substances that the color of gold varies. The idea that gold found in California or Australia is of such a color because found there, is a mistaken one.

After the silver had been added the leaded cornucopias were squeezed up and each one placed in what is called a cupel. A cupel is a little cup made of sheepbones burned to ash, ground fine, moisteoed and molded into a mold an inch long, an inch in diameter, with a cup-shaped depression at one end. The cupels were placed in a small furnace with a temperature of about 1,100 degrees Centigrade, and when heated to a white heat the little metal chunks were laid by the aid of tongs one in each cupel. They melted, sputtered, and hubbled, and then began to grow smaller. In about ten minutes they were taken out and all the lead and foreign substances had been absorbed by the cupel, leaving only the noble metals in little round balls. When these were boiled in nitric acid the silver passed into nitrate of silver and the gold was left in its pure state. By this was found the ratio of pure gold in the bullion.

The weighings of pure gold are used as a check to any peculiar conditions of heat, etc. The assayer knows the constitution, weight, and specific gravity of the pure gold used. When it is weighed, after the heating process, if it has changed weight, it is fair to suppose that it is owing to the condition of heat or strength of acid, and that the same influences have been at work on the assay gold. By allowing for this in the assay gold a true result is reached.

The next step was to find the weight of the gold and silver together. The lead cornucopias were again filled with certain weights of the pure and assay gold, but no silver added. When melted in the cupels the baser metals disappeared as before, and the gold and silver were left together. By subtracting from the weight of gold and silver the weight of the gold, the exact weight of the silver was obtained. Of course, the proportion is usually very small. If the amount is not sufficient to pay for extracting, the government does not pay for it, and charges nothing for extraction.

The entire amount of gold in the bullion is found by multiplying its weight by the proportion of the gold. This is reduced to standard or coin gold by multiplying this amount by ten and dividing by nine, as standard gold is only 90 per cent fine, and the depositor is paid by the government $18.60 per ounce of standard metal, equal to $20.67 for fine gold. The assay fee is one-eighth of one per cent of the total value of fine gold, the melting fee is $1, and the alloy charge about one cent on a hundred dollars, and after this is deducted the assayer hands a check to the owner of the gold. The entire time occupied by this complicated operation was from nine A. M. until one P. M., only four hours.

Mechanical Progress.

Sound Talk to Shop Hands.

As workmen, how many of us are what we pretend to be? How many of us ask to be rated for the real value that we render, rather than for some circumstance not connected with such value? How many of us expect to be judged for some one or two showy hits of practice that we may excel in, believing that the glory from them will brighten the many weaker spots in our workmanship?

Some of us are old hands in the shop, and as such expect to have a higher rate of pay and the privilege to do less work than the newer hands. Does the employer get more money for an old hand's work than for a new hand's work, quality for quality? Some of us served an apprenticeship in the shop, and deny the new hands from other shops, of equal producing power, the right to earn the same wages we ask or get. Some of these days we may travel and then we will see the injustice of this when it is applied to ourselves.

How many of us by being careful, close-mouthed, open-eared, slow and painstaking, get credit for workmanship that is not our due, and cash equal to men of long experience, many resources and correct practice? Such is the value of dignity and the appearance of seriousness to a man that one who possesses these qualities is always respected beyond his merits, or perhaps it is that a good workman who gives his superiors the opinion that he is not in earnest, is always rated below his deserts. Perhaps it will pay some of us to think of this subject.

Do not some of us in our working hours go along with our work in a perfunctory way as a matter of habit, while our minds are studying private inventions, music or some other art having no connection at all with the job being done? Now machinery can be made, and is being made, to do all that such of us do who do that, except, perhaps, the complaints we make that other men are favored beyond us, and that we are continually slighted.

Do not some of us get less money per hour than we should get, for the reason that we have a habit of taking a day off whenever so inclined, and cannot he depended on to be at our post every day possible, without considering whether our work is needed or not, and without the formality of an interview with the foreman on the subject prior to the absence? The writer always insisted on his employers paying him his wages at stated times, and of their fulfilling all their obligations to him. To give them no excuses for delinquency, it was his practice to do with them as he had agreed. But some of us insist still more energetically on our strict rights, while we utterly fail in filling our side of the contract.

Do we not often waste 15 minutes or more a day which should he occupied in producing something? For instance, in chat with a friend on outside matters, or a little lounge about the shop after one job is finished and before another is begun? Now suppose your pay was dishonestly withheld, say about 50 cents a week, what would you do? Would you grin and bear it as the boss does about the stolen time?

Do not we believe that for every dollar we increase the value of our services that we should get about 50 cents of it? And is it not a fact that when we get to be able to do more good work every day, we have but little difficulty in getting more pay for it, and as much as 50 per cent of our increase? Which of us is retained in slack times? the "cheap jack" or the expensive mechanic?—Manufacturer and Builder.

THE HARVEY CARBONIZING PROCESS.—The Harvey process of case-hardening which bas been so successfully applied to giving a bard surface to armor plates is as follows: The plate to be treated is made out of mild steel containing, say, 0.10 per cent to 0.35 per cent carbon, and after being formed to its final shape is laid flatwise on a bed of finely-powdered dry clay or sand, which is deposited on the bottom of a fire brick cell or compartment erected within the heating chamber of a suitable furnace. The upper suface of the plate is then covered with powdered carbonaceous material, which is tightly packed. Above this is a layer of sand, and over the sand is laid a heavy covering of firebrick. The furnace is then lighted and raised to a temperature sufficient to melt cast iron, and this heat is maintained for a greater or lesser period, according to the amount of carhonizing to be effected. About 120 hours are said to be required for a plate 10½ inches thick. On removal from the furnace such a plate is found to have had the composition of its upper surface changed. At a depth of about three inches from the surface tbe percentage of carbon has been raised by about 0.1 per cent, which increases progressively as the outer surface is neared, when the amount of carbon may rise to one per cent. It is said that this process, though, as will be seen, it resembles the ordinary cementation process, does not cause any blistering of the surface of the plate. This the inventor attributes to the high temperature at which it is carried out; but it is also suggested that the absence of hlisters may be due to the homogeneity of the metal, which, unlike the wrought-iron bar used in the cementation process, is free from cinders.—American Manufacturer.

Tightening Pulleys.

Tightening pulleys is sometimes a necessary evil, and like all other evils should never be tolerated nor indulged in except when actually necessary. The life of a belt is almost sure to be shortened when a tightener is used on it, as the operator can he depended on to work the tightener hard against it whether required or not, and right there exists the great evil. If well enough is or could be let alone, and the tightener used in moderation, it would not prove so bad an agent on general principles. But that is it; well enough, or taut enough, is never let alone. The tightener's presence is a constant temptation to do wrong by forcing it against the unoffending belt; besides, what is a tightener for, anyway, if not to tighten the belt? And so one gives the wheel another turn or the lever another notch.

But, nevertheless, tighteners have sometimes to be used to make belts already in operation do the work required of them, or else a rearrangement must be made which implies a good deal of expense, and to avoid that the tightener becomes a necessary evil. Tighteners are mostly required in cases where belts are runniug on pulleys largely differing in size, and they should be run near to the smaller pulley, wbether it be the driver or driven, provided, of course, it is practicable to do so. There may be cases where the tightener cannot be applied close to the small pulley. The object of having the tightening pulley close to the smallest of the two pulleys is to use it for the purpose of increasiog the lap of the belt on that pulley. When great variation in the diameters of the pulleys exists, there is an excess of lap on the large pulley and a deficiency on the small one.

Therefore, if the tightener is used for equalizing the lap, the difficulty will be overcome without having to work the tightener very hard against the belt. The belt is put on slack, and the tightener is used for taking up the slack, and at the same time forcing the belt farther around on the face of the pulley. If by that means the arc of contact on the small pulley is made equal to that of the large one, the belt will adhere as tenaciously to the small as to the large, and will at once cease slipping.

When both pulleys are the same or about the same in diameter, then the arc of contact will be about the same, and the tendency to slip, if any, will be about the same on both. In such cases the location of the tightener is immaterial. It may be close to either the driver or driven, or half-way between, as convenience may dictate. Never fail to have the tightener on the slack fold of the belt.—Mechanical News.

Crucible Steel for Boiler Plates.

Since the discussion at the Master Mechanics' Convention on boiler steel, and tbe impression given out that some crucible steel sheets bad given extraordinary mileage in fire boxes, there has been a tendency to regard crucible steel as heing particularly valuable for boiler purposes. We believe that this impression is at best a fallacy, and that there is no kind of steel so well adapted for fire-boxes as the open hearth steel that is commonly in use. It seems certain that the tendency to break down prices has brought into the market steel of inferior quality, which is not well adapted for use in fire boxes. Many railroad officers are now saying that they are prepared to pay any reasonable price for good boiler steel, and their eyes are turned toward crucible steel as the material that is going to realize all their expectatioos. We would caution our frieods not to he precipitant in employing this material for fire-boxes. Those who are considering the merits of crucible steel will do well to study a report that was submitted to the Master Mechanic's Convention in 1888. In that report the following points were made ahout crucible steel:

"The crucible process of making steel is the oldest, commercially speaking, and for some purposes the best—that is, when steel is wanted in some small quantities of considerable purity. It is a failure when large masses of homogeneous character are required, as is the case in boiler plate. Its shortcomings in this respect are due to the process of manufacture, which, as is well known, consists in melting wrought-iron, etc., in a crucihle holding generally from 80 to 125 pounds. To obtain a mass large enough to make boiler plate, it is necessary to pour the contents of 20 to 50 crucihles into one mold to form an ingot. As the "steel" is made in each crucible, it follows that in 30 crucibles we have 30 different kinds and grades of steel in the one sheet. Tbe result, when subjected to the trying conditions found in a locomotive fire-box, is, of course, disastrous in the majority of cases, as homogeneity or absolute uniformity of the metal in this service is one of the most important elements found in long-lived fire-boxes."—Locomotive Engineering.

Scientific Progress.

Accumulators in Telegraphy.

In a paper recently read before the British Association, Edinburgh, Mr. W. H. Preece described the method of working telegraph wires from accumulators which has been in use in the London office for the past seven years.

Accumulators supply current to two large groups of circuits, one group consisting of 110 single needles and the other of 100 Morse inkers and sounders.

To provide a ready means of replacing the battery in case of failure, the leads from the working and reserve cells are first led to the test-board in the instrument-room and there joined to a switch, thence the leads are again led to the test-board in the battery-room, where the two groups are split up into subgroups of ten circuits each. The connections are made in this manner for two reasons: first, for facilitating a change of a faulty battery, and second, to prevent a general stoppage of the whole group in the event of a short circuit at any one of the instruments; the resistance of the leads between tbe instruments and subdividing connections in the basement being sufficient to prevent more than three amperes being taken from the battery by any one of the instruments, even when a short circuit is on. To prevent any damage to the instrument, or risk of fire, fuses are placed in the battery leads at each instrument. The circuits on the groups mentioned are all metropolitan, and are all, approximately, of the same resistance, no equalizing resistances being, therefore, necessary. The current in each circuit ranges between 17 and 20 milliamperes. The E. M. F. for the single needle is 20 volts—10 cells positive and 10 negative, with earth in the centre. For Morse-working, the E. M. F. is 18 volts.

A considerable extension of the accumulator system has recently been made. Since October 17, 1891, the whole of the continental circuits from the general office have been operated by currents from secondary cells. There are 59 continental circuits, and these are divided into four groups, each circuit taking a current of 100 volts.

All the cells are kept well-charged, and the E. M. F. is not allowed to fall below 1.95 volt per cell.

Accumulators are also used for working the telephone circuit in Paris. Their E. M. F. is so constant that they are fouod to be eminently adapted for the purpose.

LIQUEFIED AIR AND OXYGEN.—Prof. Dewar gave a very ioteresting lecture at the Royal Institution recently, on liquefied oxygen and liquefied air. He produced both liquefied oxygen and liquified air, the oxygen in pints, and even the liquefied air was handed round in claret glasses. Liquid oxygen boils in air at —182° Centigrade. The liquid oxygen placed between the poles of Faraday's great magnet behaved like a metal, leaping up to the poles and clinging to them till it disappeared as gas. But liquid oxygen, though so strongly magnetic, is a very bad conductor of electricity. It is a nonconducting magnet. He showed too, that so far as chemists can judge, there is probably no oxygen in the sun—the oxygen of the earth's atmosphere accounting for all the oxygen lines in the solar spectrum. The boiling point of liquid air is —192° Centigrade, or 10 degrees lower than that of oxygen. It is not true, as had been supposed, that the oxygen io the air liquefies before the other elements in air; on the contrary, the air liquefies as air, and is not resolved into its elements before liquefying. If this globe were cooled down to 200° below the zero of Centigrade, it would be covered with a sea of liquefied gas 35 feet deep, of which about seven feet would be liquid oxygen.

What Are Diatoms?

The plants in question are so small as to be seen only with the aid of the microscope; those of ordinary size, when magnified about 350 diameters, appear about a quarter of an inch long. Others are much larger. They are curious little plants with a silica shell, which, in certain places, is provided with little apertures through which living parts of the plant protrude. In this way they are enabled to move about freely in tbe water by which they are generally surrounded, for, though they are not all strictly water plants, they all need considerable water to enable them to thrive, and so are always found in wet places.

Owing to their freedom of motion, they were at one time supposed to be animals. Now it is known that they are plants, as they can perform all the functions of plants, and no animal, with all his superiority, high nature, etc., is able to do tbis. They are found everywhere in all inhabited countries, and in fact all over the seas. So it may be readily granted that a plant so common and widespread as this should be quite familiar to every one.

Again, not only are the living plants so widespread and common, hut the shells of the dead ones remain intact for many years; and in certain localities these tiny shells are so numerous as to form a large portion of the soil. Some of the best known of these localities are the sites of Richmond, Va., and Berlin, in Germany.—Emily L. Gregory, in Popular Science Monthly.

PLATINUM.—An American traveler, who has recently returned from the Urals, reports that he found that the stories about the scarcity of platinum circulated about two years ago were false, and that the increase in price was due to a combination between the English handlers of the ore and a broker in St. Petersburg, who, together, managed to control the production and get up a corner. The price of platinum went up to $19 an ounce, but could not be maintained, because a number of new mines were quickly opened, and the production was largely increased. There are now, at least, 40 mines along the course of a river in the distance of 50 or 60 miles. The ore-grains are obtained from their native sand by crude washing in tubs, provided with dashers like butter-churners. It is primitive work at the best, although some of the mine-owners employ steampower to agitate the dashers, and nothing but the extraordinary weight of the platinum prevents a serious loss in washing. After the grains are obtained, they contain from 50 to 70 per cent of pure aluminium, combined with iron, gold, osmium, iridium, and other metals of this group. The sand-ore undergoes seven operations before tbe platinum is technically pure. This purification, bowever, is not performed at the mines, but at a works in Germany, where the work is superintended by a trained chemist and assayer, who acts also as bookkeeper, and receives an equivalent of a guinea a week for his work.

THE MOST USEFUL MINERAL IN THE WORLD.—If one were to ask his friends what mineral we are most familiar with and most commonly used as food, the answers would probahly be both varied and amusing. Salt would, I fancy, first suggest itself to many, and to those whose training in physiology and hygiene has not been neglected, no doubt the claims of lime and iron and carbon, which, in one form or another, we use with food to build up bone and brawn, would he amply urged. But after all, it is water, for water is a mineral—a fused mineral. You will find it described as such, along with quartz and topaz and the diamond, in Dana's *Mineralogy*, or in other treatises on stones. We usually think of minerals as solid things, such as metals and rocks and jewels and various chemical salts. But when we consider the matter a little, we see tbat all these things, if melted by strong heat, are minerals still, only they are now in a fluid instead of in a solid state. The difference between these minerals and water is that water gets fluid at a lower temperature than they do, and, like quicksilver, stays melted at ordinary living heat; but in those old ice ages which, one after another, have swept now over the northern and now over tbe southern hemisphere, bringing ruin and desolation, the natural and common condition of water was that of a solid—ice—as it largely is to-day out of doors in winter when not kept fused by the stored-up heat of the soil and rocks or melted by the sun.—Harper's Magazine.

IT has been found that the leakage of tbe electric current into water causes the evolution of a large quantity of electrolytic gas that is dangerously explosive in mines.

A New and Splendid Companion to all the Metal Industries.

Fully abreast of the latest inventions and discoveries, as well in the largest and coarsest as in the smallest and finest of metal work.

NEW DISCOVERY.

Mines Revived and Miners Enriched

By the wonderful **MacArthur-Forrest Process**, Controlled by The Gold and Silver Extraction Mining and Milling Co. H. A. W. TABOR, Pres.; LEONARD GOW, V. Pres.; H. A. JONES, 2d V. Pres.; P. GEO. GOW, Technical M'g'r. and Ass't Treas.; T. L. WISWALL, Gen'l M'g'r. and Sec'y; PETER MCCOURT, Treas.; W. L. COOPER, Eng.

DENVER WORKS: On the D. & R. G. R. R., near the Broadway Electric R. R. Depot.

TRADE MARK.

(MACARTHUR-FORREST PROCESS)

GLASGOW WORKS: The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Tasmania, Etc.

General Office of Company:

Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: Denver: The Livingstone Gold Mining Co., Boulder Co., Colo.; Caiumet Gold Mining Co., Middle Creek, Shasta Co., Cal.; The Shasta Gold Ex Co., Middle Creek, Shasta Co., Cal.; The Mercur Gold Mining Co., Fairfield, Utah; The Pacific Gold and Silver Extraction Co., Oro Grande, San Bernardino Co., Cal.; The Gra Bella Mining Co., Yavapai Co., Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co., Revenue via Norris, Mont.; and others in course of erection.

The object of this company is to introduce the Mac Arthur-Forrest process.

We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.

If you desire an experimental test communicate with the secretary.

If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons in Denver.

We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.

The process consists of pulverizing the ores to a fineness of about 50-mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tubs especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.

The total cost, as a rule, does do exceed from $2.50 to $5.00 per ton.

The most desirable class of ores for this process are the so-called refractory gold, ores pyrites, hemntites, manganese and tellurium. We have also treated successfully dry silver ores.

We will be pleased to answer any inquiries and furnish any desired information. Address,

T. L. WISWALL,

P. O. Box 926. Gen. Mgr and Secretary.

Electricity.

The Electric Trust.

The recent combination of two of the largest electrical manufacturing companies in this country has been looked upon generally as foreboding no good to the electrical industry, and many of the subsequent proceedings of the trust give color to this view.

A combination of capital to control any branch of business is an aggression upon public rights, and an unscrupulous attack upon the pockets of the consumers of its products. Although a benevolent motive is always claimed for the perpetration of these outrages upon public justice, the invariable but nonsensical claim about cheapening the the cost of manufacture and the consequent reduction in price to the consumer is the text of the defense of these organizations. The effect of competition, which would otherwise exist, is not considered.

The effect of a monopoly in the electrical manufacturing business would be especially unfortunate, as such a condition would result in bringing the present rapid progress in the perfecting of electrical apparatus to a comparative standstill; competition being the great incentive to improvement and invention in any line.

It is essential that the inventors should feel the demand for their work in order to stimulate them to greater efforts, and the rapid progress which electricity has made beyond other sciences is undoubtedly due to the vigorous competition which has characterized its progress from the day of its commercial adaptation.

It is fortunate for the public, however, that no such contingency as a monopoly in the electrical business is to be feared, and the high-handed proceedings of the trust have not met with the success which its officers could desire, especially in the direction of consolidating the local lighting and power stations and the various supply companies.

Although it has been given out in the associated press that the Edison and Thomson-Houston Illuminating Companies throughout the country would be combined, where two or more existed in one city, no foundation for such a statement exists. These local companies are, with few exceptions, independent of the parent companies, and where a station has not been so designed as to be dependent upon a certain make of machinery, it is at perfect liberty to combine or not, as it sees fit. The above statement was but a piece of irresponsible prophecy, inspired by the hopes of the trust, but its fulfillment does not seem to be an immediate probability, judging from the dissatisfaction of the local companies, expressed at their annual meeting at Toronto.

With the characteristic greed of a combine, bills have been rendered to these companies for many things which had not been charged for under the old regime, and many of the perquisites of the Edison companies, which their contracts assured to them, were curtailed, much to the disgust of the local companies, who claimed, and rightly, that the change in the organization should not affect their original contracts.

The attempt to include the supply houses in the combine was a signal failure. The invitation of the trust to these concerns to be swallowed up was universally declined, and now this $50,000,000 corporation is attempting, by means which other trusts have found so effective, to drive their smaller competitors to the wall.

It is generally conceded by the public that the man with $1,000 000 or $2,000 000 has the right to exist and carry on a business, even in competition with an incorporation of $50,000,000 capital stock, including the water, and it is difficult to see how this freeze-out system can prove very harmful when there are 20 or more competing manufacturing companies in the field. This style of robbery needs an exclusive monopoly to insure its effectiveness.

As the trust has by no means a monopoly, but only a moderate fraction of the electrical business of the country, it is hardly probable that their manufacturing business can pay heavy dividends on such an amount of capital stock; but a branch of business which is often found profitable in combinations and trusts is the speculation in the stock of such companies by those who are in a position to properly manipulate it, and the fluctuations of this stock will be a matter of general interest, as an index to the policy of the trust in this respect.

This trust has also shown its hand, and follows in the footsteps of all such infamous combinations, by making a decided raise in the price of its apparatus. This has reacted against the aggressors, however, by considerably increasing the business of their competitors and causing dissatisfaction among former customers; but higher prices invariably follow combinations to "decrease the cost of production."

Another point on which great stress is laid is the patents held by the combined companies, which are certainly numerous but practically of little importance as far as fundamental principles are concerned, and there is no impediment in the way of operating a practical and efficient lighting or railway system. In fact, many of the machines now manufactured by the trust could be practically duplicated without infringing any patents; but such a task would hardly be attempted by one well informed on the designing of electrical machinery. The fact, however, that such a number of companies are engaged in the manufacture of practically similar machines and apparatus leaves nothing to be feared on the score of exclusive or fundamental patents.—Electricity, New York.

Electric vs. Steam Roads.

In an article in a recent number of the *Railroad Gazette* on electric and steam traction for suburban and through lines, not car-line traffic, the writer reaches the following conclusions:

1. There is no prospect for electricity replacing steam for long-distance freight traffic.

2. There is a possibility of electricity becoming an economical substitute for steam locomotives for high-speed service, wherever the traffic is sufficiently heavy and constant to warrant the construction of lines of track independent of those used for moderate speeds.

3. There are very few localities in the United States in which the conditions are such as to make such a substitution commercially possible, with the efficiencies at present obtained with electrical machinery.

4. If the electrical equipment could be purchased at reasonable prices, there are a few short lines of steam railroad on which the passenger traffic is such as to make electricity a possible form of motive power at present speeds.

5. It is probable the electric locomotives will be used in tunnels and for switching in cities where freedom from smoke is important.

6. No electric motor capable of doing the work of a medium-weight steam locomotive has yet been constructed.

The first conclusion is evident from the fact that the cost of the conductors for the electric current and the loss on the long lines due to leakage and resistance would more than offset what might be gained in the fuel saving. The second conclusion is also evident, except that part calling for independent tracks and for high-speed traffic. Why the traffic must be independent is not clear, as all that is needed is a clear track, and that can be had with slow or high speed trains. Perhaps a constant speed may be an essential condition, but it may be high or low and yet be constant. So far, the above-quoted journal says, electric construction companies have been simply talking, and in that they contrast strongly with makers of other mechanical innovations, who do, as a rule, make a try at a job at least before they talk of the wonderful possibilities of their devices. But to do them justice, we should say they are working in good faith, only they prefer that some one else should pay the cost of making expensive experiments. The Baltimore and Ohio tunnel job will give them a chance to show what they can do, as the horsepower required to haul the proposed trains at the proper speeds up the given grades, viz., 1200 tons at 15 miles an hour and 500 tons at 30 miles an hour up a 42-foot grade, is about 950. This is certainly enough to commence on.

Electric Wiring Specifications.

The growing stringency of insurance rules for the installation of electric light wires, and the demand for sightly and thoroughly efficient work, would be a matter of less concern to electric light contractors if architects and builders would recognize, or be brought to realize, what important factors they are in the matter. As it is, very rare instances do architects' plans and specifications contain any of the provisions that would not only lessen the difficulties of the electrical contractor, but would enable him at the same time to execute a job in exact accordance with the spirit of insurance rules and in a workmanlike instead of a necessarily makeshift and unsightly manner. As a rule, says the *Electrical World*, the builder seems to think that running the wires is merely a question of somehow getting them in place; and unless a close watch is constantly kept, the electrical contractor finds himself left on the outside of finished work with a quarrel on hand as to who is to stand the expense of renewing the work after the wires are installed. While the matter of channeling the walls for risers, providing hollow cornices, distributing closets and a few other details might not be beyond the reach of some architects, upon the whole the quantity of details to make a satisfactory installation is such that the services of a specialist are necessary when the work is at all important in extent or character. The logical solution of the difficulty is to employ an electrical engineer to draw up the wiring plans and specifications, and for the architect in turn to provide for the conveniences these call for. The contractor would thus find his path less rugged mechanically, his apprehensions on the score of the insurance inspector less disquieting, and, moreover, have the support of the architect in restraining the "previousness" and hostility of the builder. It is to be feared that this idea would not be viewed with favor by many all-sufficient architects, but the enterprising electrical engineer, by bringing it to the attention of the owners at an early stage of the work, would not only benefit himself but the profession at large, and should receive the indorsement of underwriters' associations in his endeavors.

Useful Information.

Portland Cement.

Portland cement, contrary to an opinion very commonly held, is, comparatively speaking, a modern invention. The first factory established was on the Thames, in England, and the process was so crude and the demand so small that up to 1850 only three factories were in operation. At present nearly 8,500,000 barrels of cement are made in Great Britain each year, and the annual production in Europe is over 20,000,000 barrels. The process is much the same at present as it was 20 years ago.

In England, the raw materials are chalk and clay, both very pure, and even with inferior processes they make a very satisfactory cement. Portland cement was imported into the United States as early as 1868. In 1882 the amount imported was 370,000 barrels, while at present it exceeds 3,000,000 barrels a year. American manufacturers of Portland cement are at a disadvantage on account of the character of the material used in this country and the difficulty of handling the same.

The American process requires about eight days, and demands great care to produce a uniform product; and yet great improvements are in progress. The processes used in the Portland Cement Works at Copely, Pa., for example, bid fair to revolutionize the science of cement-making. At the factory, the raw compound is burned in a powdered condition while traveling in an inclined hot-air furnace, through which is passed a hot petroleum flame, and a few hours is sufficient to finish the process. The resulting cement is of excellent quality and is guaranteed at very high figures.—Manufacturers' Gazette.

MACHINERY AND LABOR.—The *Manufacturers' Gazette* says: Most of us can remember when the laborers in some of the Western States were burning or otherwise destroying the reapers and binders used in the grain harvest, or boycotting the farms where they were used, because they were depriving the poor man of his employment. Now they say that 44,000 laborers are wanted and cannot be obtained to harvest the crops in Minnesota and South Dakota. The introduction of machinery so changes conditions upon the farm, as in other business, that any lack of employment is likely to be only temporary, and as soon as conditions are adjusted more business is done, more help employed and higher wages paid. The spinning jenny, the loom, and the whole history of the rise of steam power prove this. In fact, the increased use of machinery and the improvements made, means the production of goods at lower prices, and their increased consumption by the poorer people. When our grandfathers bought seven pounds of wheat flour at a time, twice a year, or at Thanksgiving and Christmas, machines were not needed to harvest the wheat crop. Rye and Indian bread was used then.

IN 1790 three patents were issued. One hundred years later the number was 26,292 The total number of patents granted during the 100 years was 453,944, or an average of nearly 13 patents for every day.

NUMEROUS experiments to determine the best fire-resisting materials for the construction of doors proved that wood covered with tin resisted the fire better than an iron door.

Assessment Notices.

NOTICE OF ASSESSMENT.

KEYSTONE CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Amador City, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22d day of August, 1892, an assessment, (No. 3) of One Dollar ($1) per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room 43, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of September, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 18th day of October, 1892, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. H. ISHAM: Secretary

Office—No. 310 Pine Street, Room 43, San Francisco, California.

EVERETTE'S MINING OFFICE.

(Pioneer Mining Geologist's Office of the Pacific Northwest.)

Mining Law, Mine Examinations, Metallurgy.

ASSAYING AND ANALYSIS.

"Consulting Associate Mining Attorney at Law.

Will examine and report upon "Title and Exact Value" of GOLD, SILVER, LEAD, COPPER, COAL, IRON, CLAY or other MINERAL PROPERTIES **in any part of the world.** Any information mining men may desire to know, relative to the *mineral* or *coal* resources of the entire Pacific Northwest, will be honestly given.

DR. WILLIS E. EVERETTE, 1318 E. ST., Tacoma, State of Washington, U. S. A.

HORACE D. RANLETT,

Ores, Mining, and Commission,

420 Montgomery St., S. F.

Ships under advances to smelting works in Boston New York, Baltimore and Liverpool.

Twenty-five years' experience in Shipping Ores and Managing Mines.

Solicits Consignments of Copper Produce and Management of Mining Matters.

Business Manager of UNION COPPER MINE, Copperopolis, Cal.: NEWTON COPPER MINE, Amador Co., Cal.

MINE OWNERS, ATTENTION!

A first-class millman and gold and silver amalgamator desires a situation. Has had charge of four mills, and has worked in many more. Can give best of references and recommendations from former employers Parties who are likely to want a millman would do well to correspond. Address, "E. M." Station A., Los Angeles, Cal.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

BY P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water Over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, $2.00, post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco, Cal.

AMERICAN MINING AND STOCK CODE

"KELLOGRAPH."

Indispensable to the Mining Profession and Useful in all Business Transactions.

A Complete System of Transmitting Telegraphic Messages by Code Cipher Words in a Legible, Secret and Economic Manner.

OVER 35,000 WORDS AND SENTENCES

Subject to transmission under infinite complication by the use of over 70,000 code words.

No danger of publicity in telegraphing matters concerning operation or sale of mining property. The work strictly alphabetical and classified. The handiest work ever published for mining operators.

PRICE, $5. Forwarded postpaid on receipt of price by

DEWEY PUBLISHING CO.,

220 MARKET STREET, SAN FRANCISCO.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

Good Health.

Cholera Germs.

At the last meeting of the San Francisco Microscopical Society two papers were read on the cholera. The first was by Henry E. Sanderson, M. D., on "The Spirillum of Asiatic Cholera," and the second by R. H. Freund, "A History of the Cholera Organism."

Dr. Sanderson prefaced his paper by a brief account of the method pursued in laboratory work, with cultures of cholera and other disease germs. He said he had no doubt most of his hearers were already familiar with the methods, but for the benefit of his lay hearers he exhibited the various articles used and some of the apparatus.

In 1829-37 Europe, he said, was for the first time attacked by a hitherto unknown disease, which spread with great rapidity over the continent. It came originally from Asia, from the region of the Ganges delta in India, hence the name of "Asiatic cholera." It has since reappeared at varying intervals and has done its deadly work, but for many years its cause was but a mystic conjecture.

In 1883, as the epidemic again spread to the confines of Europe and threatened to cross the borders, the German Governmeot sent a commission to the infected regions to investigate the disease, and especially to search out the causative factor. At the head of this commission was Dr. Robert Koch, who discovered in the discharges the germ since known as the comma bacillus.

In bacteriology there are three forms of vegetable life; the bacillus or rod-shaped, the micrococcus or berry-shaped and the vibrio or spirillum, the spiral-shaped. The cholera germ belongs to the vibrio spirillum group. Some are very slightly curved, others more markedly so. It is ooe-half the length of the Tubercle bacillus, much thicker and has rounded ends. Some are so much curved as to form almost a semicircle and occasionally, where two or more are joined together, a spiral or letter S form results. Where marked spirals occur it is due to peculiar circumstances, such as restrict the ordinarily quick subdivision, by means of which multiplication occurs.

The germ is very active in its movements. In proper culture media and with proper temperature they swim and wriggle around the field of vision like a swarm of gnats. At one end of each is a whip-like process or flagellum, by means of which this motion is induced.

The question as to the existence of spores is not yet definitely settled. No one has ever been able to prove their presence by staining methods. Hueppe claimed to have seen sporuration taking place in a hanging drop, but his observation has not been confirmed. In order to prove the existence of spores in bacteria it is necessary to prove the existence of forms with far greater resistance power than that possessed hy the bacteria themselves. No such enduring forms have been found in connection with the cholera germs. On the contrary this germ is among the most sensitive microorganisms koown. A temperature over 122° F. kills them quickly. They stand chemical influences very poorly, especially mineral acids. The hydrochloric acid of the gastric juice kills them, and if the gelatine-culture shows a trace of acid the culture will fail. Dryness kills in a short time, sometimes in a few hours, while in fluids they remain virulent for months. Other bacteria easily overpower them, and in putrefying fluids the germs of putrefaction are apt to kill them.

In artificial cultivations, as a rule, the free entrance of atmospheric air is required, though under some circumstances thriving without it. In the intestinal contents of man they thrive without atmospheric oxygen, but produce oxygen from the chemical changes induced by themselves. With a temperature under 50° and over 107° F. they do not flourish.

The method of infection of the general system seems to be somewhat misunderstood, if one judges from newspaper articles which have lately appeared in this city. The bacteria themselves do not get into the blood and the various organs of the body, but remain confined to the intestinal contents, with some invasion of the intestinal walls and occasionally of the intestinal lymphatic glands. From the intestinal tract absorptions of poisonous substances produced by the bacteria into the system at large, absorption of the "toxines," or *tox albumens*, and the consequent poisoning, is what gives the symptoms of the disease; although the thickening of the blood and the terrible drain upon the system from the copious evacuations does, also, great injury.

There are several other bacteria which look under the microscope very much like the vibrio of cholera, and these were very fully described by Dr. Sanderson. He had also placed under microscopes for inspection preparations of the cholera germ and these allied forms, all of which were closely observed by those interested in the paper. He gave a full description of the methods of culture of these various germs, the media employed for the most perfect and rapid development of each, and much valuable information.

Bathing, and Why We Should Bathe.

Among all the appliances for health and comfort to mankind, we may safely say there is nothing so well known, so useful, and withal so comforting, and yet so little practiced, so carelessly and thoughtlessly neglected, as judicious bathing. The skin of the human body, from head to foot, is a network of pores, which ought always to be kept free and clear of obstructioos. These pores are the openings ioto minute tubes or channels, which lead through unseen meanderings into the sanctum of life within.

To those blessed with good health. a bath, as a commonsense appliance, gives thrift and growth to healthy functions, a brightness and delightful serenity, a clearoess of mind and buoyancy of spirit. It is certainly a blessing to both mind and body. For the mental worker, it is a nerve tonic. A thorough immersion in water of proper temperature will calm and give strength and tooe to his whole system. The indoor laborer who gets but a scanty supply of fresh air, needs a bath to obtain those invigorating elements so common in the open air.

The outdoor laborer—especially the farmer—who works with heroic energy all day long, unavoidably gathers on the entire surface of his body a complete prison-wall of dust and thickening, gummy perspiration, and when his day's work is done, he needs then, more than any other thing, not only a wash, but a good, luscious "full bath," to fit him for a clean bed and a refreshing sleep.

The glutinous mass of perspiration, dust and filth, which gathers on the surface of the body, naturally covers and clogs the pores and often enters them and poisons the system. To remove that filth, frequent ablutions and occasional immersion in water are exceedingly desirable, and usually indispensable to health and comfort; consequently, every family should have a convenient bath, and a full bath, too, of some kind, not only for general neatness of person so desirable to every individual of taste and culture, but as a means of preserving health, and in many cases, especially under the advice of a good physician, as the safest, pleasantest and one of the most powerful and efficient means of combatiog disease. Directed by good judgment and wise counsel, a hath is a valuable auxiliary to other remedies, and it can be used when internal remedies cannot. In the long catalogue of diseases to which flesh is heir, scarcely one can be named in the treatment of which a bath is useless. In an emergency, which often happens when least expected, as in cholera, cholera infantum, cholera morbus, cramps, fits, etc., a pliable, portable hath, which requires but little water, ready just at the right time, may save some precious life.

Finally, every one needs a bath at times, and every human habitation should contain something that will serve to secure a complete immersion in water, and since convenient and efficient portable baths at comparatively low figures are now extensively advertised for sale, there is little excuse for any one to be without this priceless benefit. Manufacturer and Builder.

MECHANICAL PROPERTIES OF SOILS.—The property of absorbing and retaining moisture is important. Clay loams and peaty soils absorb the largest quantity of moisture and retain it best, especially those peaty soils which have a large excess of organic matter in them. Pure clay soils are generally too compact, while sandy soils are too loose either to absorb or retain moisture. On level clay soil the water will stand and become stagnant. This is the case also with sandy or peaty soils with a clay subsoil. Under these circumstances draining is necessary. The air should be allowed to circulate freely through the soil. It carries the elements of plant food contained in it to the roots. Carbonic acid gas and ammonia are both furnished in this way to a considerable extent. It promotes the decay of vegetable matter present, and thus again provides food for plants. The proper chemical changes in the mineral elements of the soil are promoted by the carbonic acid and the oxygen of the air. How necessary, then, that the soil should be well plowed and well pulverized.—Florida Farmer.

SHEET IRON PIPE

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.

— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,

ALL SIZES,

For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.

Made in Lengths Desired from 10 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade o annealed Charcoal Iron of great tensile strength.

The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, PITCH and PETROLEUM, at a Temperature of 300° Farenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

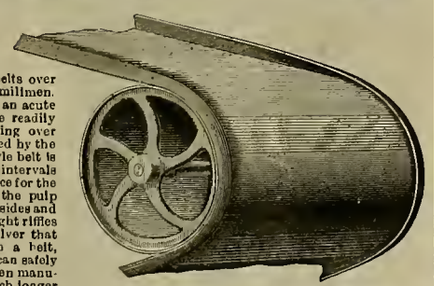
THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.



First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets

H. G. BLASDEL, Jr., Manager. 419 California St., San Francisco.

DIAMOND ROCK DRILLS.

For prospecting Mineral Veins and Deposits, Boring Vertically, Horizontally, or at any angle to any desired depth, taking out a Cylindrical Section or Core the entire distance, showing exact character, and giving a perfect section of the strata penetrated. FRUE ORE CONCENTRATOR

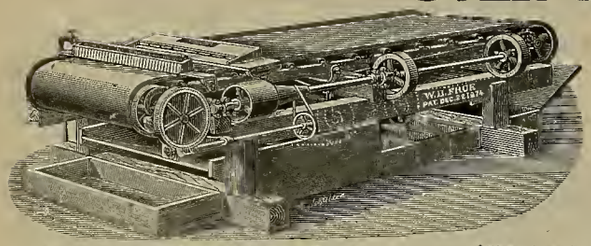
OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.



GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Calaveras Co., Cal., Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner ..... 800, f. o. b.

H. J. SUMMERHAYES, Successor to Adams & Carter, Agent for the FRUE ORE CONCENTRATOR.
No. 132 Market Street. - - San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

(PATENTED.)

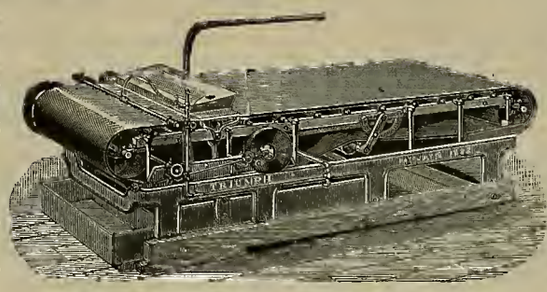
The competitive trials which have been held between the Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be.
Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

Both the "Trimnph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,
Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

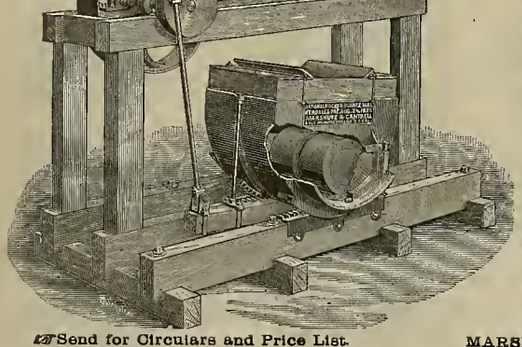
MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this Improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Puiverizers or and other ore crushing machines now before the public.

Mining Summary.

The following is mostly condensed from journals published in the interior. In proximity to the mines mentioned

CALIFORNIA.

Amador.

SHUT DOWN.—Amador *Ledger*, Sept. 17: The Clinton Consolidated mine was compelled to shut down Monday night on account of the scarcity of water. The company intends to make some needed improvements to the old shaft and sink it 200 feet, and will add to the mill ten more stamps. To perform this work they have decided to retain in their employ the married men.

KENNEDY.—The steady work of the Kennedy mine for several days previous to last Monday exhausted the water in the reservoir to such an extent that Monday night's run was made with steam to allow the water supply to accumulate.

SUTTER CREEK.—Mining is moving along in the usual prosperous way. At the Hector all is life. The ore-bins are nearly all full of ore. Almost everything is in readiness for starting the mill. The force of men in the mine is being gradually increased, and it will be only a short time when a sufficient number will be employed to keep the 40-stamp mill going steadily. Mr. Valentine is having everything arranged for convenience and dispatch and of the most modern style. From present appearances it will be but a short time before the Hector will be one of the best-equipped mines in the county. At the Wildman occurred a slight accident last week. The 11-inch pipe which runs the hoist broke a short distance from the works. The 30-stamp mill is kept running steadily and the last clean-up was the largest had for years. Crosscutting west in the South Eureka has been abandoned. About 300 feet from the shaft they found some ledge matter bearing some gold, and they think that by drifting on the vein it might develop into a good-p ying body. But they have turned their attention to the east ledge which is evideotly the main channel, and are drifting north and south. They have enough already in sight to convince them they have a good mine. A month or six weeks more drifting on the ledge and they intend sinking 300 or 400 feet deeper, at which depth they feel very confident of the development of one of the best mioes in the county. The Belmont is moving along in about the usual way. They are getting out rock and expect to start the mill in a very short time. They are considerably hampered on account of their hoisting machinery, everything being done by whim. The movement is extremely slow and the power is altogether inadeqnate. Mr. Tibbetts is qnite hopeful of having a small engine put in before many weeks and one of Knight & Co.'s water-wheels, which would facilitate the developmeot of the mine materially. Surface work at the Lincoln has come to a permanent standstill. In all probability work of that nature has been carried on for some time with but very little remuneration, and nothing but a detriment to the property. There is a good mine known to exist there, and all it needs is capital to open it np and develop it, which will undoubtedly be done in the near futnre.

AT THE SOOTH EUREKA.—Amador Co. *Record*, Sept. 15: Everything is running along smoothly at the South Eureka mine. The west wall was encountered at a distance of 312 feet. Work has now ceased in this qnarter and they are drifting north and south on the east wall from the crosscnt. Dr. J. .. Mayon, C. W. Randall and John Taylor were np from San Francisco last week on business connected with the mine. They expressed great satisfaction with the developmeots that have already been made.

El Dorado.

BEAA CREEK. — Cor. Placerville *Democrat*, Sept. 15: There is considerable prospecting going on in this neighborhood. Jackson Bros. are actively engaged in opening two mines in the vicinity of Spanish Flat. The Lewis mine on the east side of Rock creek is showing np well and promises to become one of the prominent properties of the county. Mr. Jas. D. McLane is reported to have made some rich discoveries in the vicioity of Dutch creek. He uses a divining rod, or, more properly speaking, an electric indicator.

Modoc.

AT HAYDEN HILL.—Adin *Argus*, Sept. 15: From parties down from Hayden Hill last Saturday, we learn that the Golden Eagle mine is prospecting better than for years past and better than any of the mines there. A few days ago the owners, Messrs. Highett, Richie and Dillon, struck a vein that assays about $200 to the ton. Dan Ambrose, who has been at work for the Tnnneling Co., says they have their tunnel in 450 feet. Nothing of importance has been found yet, although indications are fine. This tuonel promises to open rich veins. Work was commenced and is progressing on a systematic scale, and if the Hill is rich with the yellow metal this company will find it.

Nevada.

THE CANTENNIAL.—Nevada City *Herald*, Sept. 19: The latest news from the mine is to the effect that the main tunnel is being driven ahead through the back gravel channel. The deposit shows a raise above the tunnel and is of the same general character as at last report, the gravel being coarser and the gold heavier than that fonnd in the front channel. The tunnel is now in 2500 feet, and the problem now is whether to continue driving it ahead or stop and go into practical washing operations, utilizing the very extensive deposit already developed of good pay gravel in the front channel. This can be done advantageously, and the extending of the tunnel reserved for the winter season, when gravel-washing may be obstructed by bad weather and deep snow.

TELEGRAPH MINING CO.—Grass Valley *Telegraph*, Sept. 19: We are glad to note that the Telegraph Mining Co. is now in good ground and with every prospect of big success. The miners working there have been in "hard ground" for a long time and the expenses of the work have been very heavy. The stockholders have shown courage and confidence and have come up with assessments with entire promptness. Now that good ground has been encountered progress will be rapid and any day may give a big find. The Telegraph is a home company and its affairs are well managed by men who understand the mining business.

BUSY.—Grass Valley *Telegraph*, Sept 13: The Rogers quartz mill is very busy. To-morrow it will start to crush ore of the Lafayette mine, and will then have a ruu on ore from Osborn Hill, from the Twitchell and several other s. Ore enough is on hand to keep the mill busy for a month, and the ore is good. The mill is perfect in equipment and full returns are given.

WYOMING CONSOLIDATED. — Grass Valley *Union*, Sept. 13: The Wyoming Consolidated mine of South Grass Valley is looking very well. The incline is now at a depth of 165 feet, and the quartz coming out is making a fine appearance, showing in heavy sulphurets, galena and black jack, with a liberal sprinkling of gold. The vein is from 8 to 18 inches in size, and all of it is carrying mineral as here stated. The prospects are the best yet encountered in the mine and are highly encouraging to the stockholders, who have held fast to their faith that the mine would develop in good shape. Mr. Runnells, the superintendent, brought some of the rock np from the mine yesterday, and it attracted much attention and was favorably commented upon by experienced miners. The quartz can be seen at the cigar store of Parsons & Quick.

San Diego.

JULIAN MINES.—*Sentinel*, Sept. 13: There is no hurrah in mining circles, but all the boys that are working are taking out gold, and doing much better than working for wages. A. P. Fray and Robert Johnson commenced about 11 months ago to open up the Eagle mine in the face of almost insurmountable obstacles; they have said nothing about their work, but have accomplished greater results in that time than any mine in the camp. They have driven a tunnel 800 feet into the mountain. Last week they had their first crushing of ore, and those that stood by the men have found that their confidence was not misplaced. The ore yielded $85 per ton, and they have considerable on the dump and plenty in the mine.

Shasta.

A RICH STRIKE.—Shasta *Democrat*, Sept. 14: Mr. Conner, a successful miner and prospector, a week ago Sunday made one of the richest discoveries, on Salt creek, ever made in Shasta county. The find is on the old Kempton grouod on an adjoining claim to the Cleveland, one of the Tellurinm gronp. He purchased the claim for $100, and theo went to work carefully prospecting. He was rewarded by uncovering a prospect from which he has taken out between $500 and $6000 in sinking about 10 feet. The vein is about three feet wide, has true walls, and prospects immensely for 150 feet along the surface. Pounds of the rock taken out hung together with strings of gold. Mr. Connor has four claims in a group there, all of which show np well.

Tuolumne.

MINEAS KILLED. — On Tnesday, William Symons, Sr., and J. B. Leavitt were killed in the Carlotta mine. They were standing upon a temporary platform built in the shaft for the purpose of making repairs, when the platform gave way, precipitating them to the bottom of the shaft, a distance of about 100 feet, killing them instantly.

NEVADA.

Washoe District.

CONS. CAL. & VIRGINIA.—*Chronicle*, Sept. 17: There has been extracted from all parts of the mine during the week 986 1670-2000 tons of ore, which was shipped to the Morgan mill, the average value of which, per car samples, was $24.74 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $20.29 per ton per battery samples. Bullion shipped to Carson Mint, assay value, $14,102.31.

MEXICAN.—On the 1465 level, the west crosscut, which was started from the drift run north from the crosscut run west from the bottom of the winze sunk 101 feet below the sill floor of this level near the south boundary of the mine, has been advanced 15 feet; total length, 82 feet, continuing in porphyry and clay.

UNION CON.—900 level: The joint Union Con. and Sierra Nevada west drift has been extended during the week 24 feet; total length west from the joint shaft, 2419 feet. The face is in porphyry, from which there is a strong flow of water.

SIERRA NEVADA.— The joint Sierra Nevada and Union west drift, 900 level, has been advanced during the week 24 feet; total distance west of shaft, 2419 feet; face in porphyry, from which there is a stroog flow of water.

ANNAS.—During the week east crosscut north on 420 level was advanced 19 feet; total length, 122 feet; formation in face clay and porphyry.

GOULD & CURRY.— All work in the old stopes, on the 200 and 400 levels, has been discontinued. During the week we have extracted 39 cars of ore, car samples $19.31. Shipped to the Occidental mill 32 tons and milled 85 tons; battery assay, $21 28. Discontinued shipping ore on the 11th inst. Resumed work in the joint north drift with Savage Company on the Sutro tunnel level and advanced same 10 feet; total length, 540 feet; face of drift in very hard rock.

BEST & BELCHER. — 900 level: During the week the north drift from east crosscut, No. 1, has been advanced 15 feet; total, 952 feet; face in porphyry, clay and quartz.

HALE & NORCROSS.—1800 level: During the week advanced the north drift 15 feet; total length, 195 feet; face in porphyry. We are also diggiug a drain in this drift. The south drift on this level was extended 10 feet, when work in the face was stopped, as the drift has reached our south line. We have put in place on the 1800 level a No. 9 Knowles pump. Extended the compressed air pipes from the 1500 to the 1800 level, and carried the discharge pipe for the pump from the 1800 to the Sutro tunnel level, and are fully prepared to handle any water we may encounter on this level.

POTOSI.—Extracted and sent to mill the past week, 41 500-2000 tons of ore from the 550, 930, 1100, 1150 and 1800 levels. Worked during the week, 311 tons. On hand at mill, 81 900-2000 tons; average battery assay, $21.79; average car sample assaye, $24.55.

CHOLLAR.—Are repairing north drifts on the 750 and 850 levels. The east crosscut, 160 feet south of north line, 930 level, is in 50 feet; face in soft porphyry.

WAAN SHAFT.— The joint Alpha and Exchequer west crosscut, 1800 level, is out 41 feet; face in quartz and porphyry. The joint Potosi and Bullion northwest drift, 1800 level, is out 844 feet. The face is in hard porphyry.

BOLLION.—The station in the Potosi winze, 1850 level, is completed, and a drift started southwest to connect with the northwest drift from the Ward shaft. The drift is now in 42 feet from the footwall; face in low-grade quartz. The northwest drift from the 1800 station, Ward shaft, is out 844 feet; face in porphyry.

OCCIDENTAL.—From the stopes on 350, 400 and 450 levels have extracted and milled 172 tons of ore of the assay value of $19.85 per ton as per battery samples.

Tuscarora District.

NAVAJO.—*Times Review*, Sept. 16: The stopes are looking better this week, yielding three cars of ore estimated at $367 per ton, and eight cars at $45 per ton.

BALLA ISLA.—No 1 upraise, 250-foot level, extended six feet; the vein is looking better and the ore of higher grade. North drift on vein from the raise extended eight feet.

NOATH BELLE ISLE.—North drift, south 300-foot level, extended five feet; ore continues high grade and the vein is getting wider. Stopes below the 400-foot level are not looking so well.

NEVADA QUEEN.—Stopes at chutes 6 and 7 are about exhausted. Stopes below the level continue about the same as last report. Exposed in east line drift one foot of second-grade ore. Hoisted 33 cars first-class ore, sample $322 per ton, and 160 cars second-class, sample $24 per ton.

COMMONWEALTH.—Stopes from east line drift not so high grade. East drift from No. 3 chute extended 20 feet without improvement. Third-level stopes producing usual amount of second-class ore. Hoisted 16 cars first-class ore, sample $270 per ton, and 138 cars second-class, sample $24 per ton.

Hawthorne District.

AT WORK.—Hawthorne *Bulletin*, Sept. 15: Pat Shannon has a force of men at work on the Morning Star in Hawthorne District. It is reported that the lessees of the Pamlico mine have cut into a Body of high-grade ore in that mine. A force of men is at work setting the poles and stringing the wires for the new telephone line between Hawthorne and Bodie. The arrastre made its first cleanup last week, after running through 25 tons of ore. The result is said to have been satisfactory. There is ore enough waiting for the arrastre to keep it running steadily for several months.

ARIZONA.

FROM VARIOUS CAMPS. — Mohave *Miner*, Sept. 15: Ten tons of ore from the Queen Bee mine, near Mineral Park, are expected at the sampler next Sunday or Monday. Several rich strikes have been made in the mountain on the west side of Detrital valley, this county. The ore is rich in horn silver and oxides rich in the white metal. Beebe's big team took out the last load of machinery for the Chloride smelter yesterday morning. We are reliably informed that the smelter will commence operations about the first of the month. One of Beebe's big teams is engaged in hauling 200 tons of Gold Bug ore from the mine to Monaghan & Murphy's mill on the river, from which point the ore will be shipped to the Needles on barges. The Flores mill is ponnding away on high grade gold ore and turning out large quantities of bullion and conceotrates. There are fully 600 tons of rich free-gold ore on the dumps of the mines in the vicinity of the mill that will be worked before a cleanup is made. On the Irondale mine, 100 yards north of the Chief of the Hills, in Indian Secret district, owned by Messrs. Eaton, Cowan, Taggart and Woods, a six-inch streak of ore has been encountered, which will run from 500 to 1500 ounces of silver to the ton, and the owners feel exceedingly jubilant over the find. Robt. J. Grant, manager of the Gold Bug mine, has been spending the week in Kingman. He informs us that the new shaft being sunk on that property is now down about 85 feet, and in good ore all the way. The mine is employing 12 men, and the company is putting the property in tiptop shape for the extraction of large quantities of high-grade ore this winter. The Prince Albert mine in white Hills, owned by Robt. Patterson, is showing np finely, and 14 leases have been given to different parties. On the leass worked by Jackson & Co., several sacks were recently extracted, and, after cutting down the pile of ore, a sample was obtained which ran $5821, figuring silver as worth 83 cents, or 8556 ounces per ton. Every one who has been fortunate in securiug a lease on this valuable property is takiug out an immense amouut of this kind of ore, and in every instance making money hand over fist.

RICH FIND.—Globe *Silver Belt*, Sept. 17: A remarkably rich find of silver float was made at Richmond Basin a few days since by J. C. Glisson and Lanzbury on one of Leroy Ikenbury's claims. The discovery was made by the men while chopping wood, and at last accounts about 100 pounds in nuggets had been found, several of which weigh five or six pounds. They were all found a few inches below the surface, and Messrs. Ikenbnry, Glisson and Lanzburg are now eagerly searching for the ledge from which the nuggets came. Their estimated valne in eilver is seven to eight dollars a pound. They are by far the handsomest silver specimens we have ever seen. Considerable rich float has been found in the Basin from time to time, and the mines there have produced a large amouut of silver, notably the Mack Morris mine, the output of which was nearly $700,000. Bnt the belief prevails that untold wealth remains to be nearthed in the Basin or the overtowering Apache peaks.

LOCKY CUES.—Tombstone *Prospector*, Sept. 11: Five years ago yesterday morning at 7 o'clock, ground was broken for the new working shaft on this mine, which up to the present has been a fine producer and bids fair to keep up its record. The output from that time to the 1st of Jnly, 1892, has been 19,693 tons, containing 476 293 ounces of silver and 5972 ounces of gold. The ledge of this mine is a giant in strength the full length of the claim, as demonstrated by the development on the several levels; but most of the ore is too low in valuation to pay with the prices that have prevailed and are now ruling. A marked exception has been in two immense cbntes of ore that have yielded handsome returns.

TOUGHNUT AND NORTHWEST.—Nothing new in these, but usual output of ore, if we except development on surface near the Northwest hoist on a very promising outcrop of ore that has beeo walked over for many a day.

GIAAAN AND SULPHURET.—On the third level of the Sulphnret, prospect work is still going on through a winze, operated by an underground hoist. On the Girard the new steam pump, received a few days since, is being placed on the fourth level (350 feet deep), and the ledge will be further prospected by an incline winze.

NOTAS.—Over 800 tons per month are being shipped by this company. It takes 15 engines in constant employment to do the work—four surface hoists, three nnderground hoists, two air compressors, three rock-breakers run by independsnt engines, one at the machine-shop and in the Lucky Cnss, one on diamond drill, and one on pnmp.

MONTANA.

THE PAAAOT.—Butte *Inter-Mountain*, Sept. 17: At the 800-foot level of the Parrot mine the etation is bsing cut at present and in a week or so exploration work will be in active progress. Few mines in this district have such a record for steady production as has the Parrot. Month after month the polished discs of its mammoth engine revolve, carrying up from its depths hundreds of tons of the very richest copper-silver ore. Few mines are as well equipped for the extraction of ore and none can take precedeuce in the way of neatness of surroundings or conveniences afforded its employes. Friday afternoon the *Inter-Mountain* man was afforded an opportunity of exploiog its lower levels. With Superintendent Tibbey as a guide a descent was made to the 600-foot level. This station is said to be the largest in Montana and the air of cleanliness which pervades it could be imitated in other mines to great advantage. All the walls are whitewashed. The signals of the mine are posted conspicuously on both sides of the station. A duplex Knowles pnmp, capable of forcing a large volume of water 1000 feet high is at work in the east end of the etation throwing 4200 gallons of water to the surface every honr. As the drift is entered, a current of air sufficient to extinguish candles is felt, and this strong draft being something nnheard of at this depth an explanation was demanded. It seems Mr. Tibbey eojoys the distinction of having a "hobby" and that "hobby" is on the matter of mine ventilation. He has succeeded in demonstrating that mines can be rendered cool and furnished with pure air without the aid of an artificial draft, and, as he believes that pnre air is as essential as food to a miner, he has perfected a process of ventilation by natural means for the Parrot mine, which has earned for him the gratitude of his employes. We push into the drift and etop for a moment to gaze on a slimy accumnlation of a beautiful green color which has formed on the sides of the drift. It is the exudation of the mineral body which has been carried down from the ledge by the water. Farther on, the sides of the drift are covered by beantiful green crystals. Eleven hundred feet from the station, through a drift with a plank floor as level and smooth as a billiard table, the breast or face of the drift is encountered where a number of miners are at work. Here the magnitude of the great 35-foot ledge of copper-silver ore is shown.

BONNER.—Messrs. Coulter, McRae & Williams have leased and bonded the White Monntain mine in Brown's Gulch and will begin operatione on the property at once. The White Mountain adjoins the Sailor's Dream, a good paying gold property owned by Kendrick & Co. of this city. It is said that Finnegan and Rising have again made a lucky strike on the Florida. A ledge of silver ore was nocovered a few days ago which assayed 2000 ounces to the ton. The new 10-stamp mill erected by Dave McCranor, at McCranorville, is running full

blast and is in charge of Mr. Rihell. A tramway 317 feet long is built down the side of the mountain, and it is expected that by October 1 it will be in running order. The Silent Treasure Co. has its mill almost completed. A test quantity of rock was put through the stamps during the week and worked satisfactorily. The company is considering a proposition to put in a dynamo. There is abundant available water power to generate an electric current at a trifling cost for maintenance. Sheriff Lloyd has some good news from his Golden Chief mine this week. Some time ago he let a contract to sink the shaft 100 feet. During the week crosscutting began, and the sheriff says a 28-foot ledge has been encountered. He says the ore runs from 18 to 200 ounces silver and four per cent copper. This property lies on the flat east of Meaderville.

NEW MEXICO.

PLACERS.—*Southwest Sentinel*, Sept. 13.—Work has been commenced in the placer mines near Hillsborough, but only a small force of men will be employed for the present. The placers in that district have been worked to a greater or less extent for the past 20 years, but the scarcity of water has prevented extensive operations. The placers around Hillsborough are richer and more extensive than those of any other district in the Territory except the placers near Golden, in Santa Fe county. Manager Waring says that there is no immediate prospect that the Flagler Works here will be started up. The low price of silver makes it impossible to treat low-grade ores at a profit, and there is no reason to hope that the works will be started this year. With silver at even a dollar an ounce, the works could be kept running to their full capacity, which is about 100 tons of ore a day. The Gold Hill custom mill is running on ore from the Patterson mine. This mine is believed to be one of the best in the district, and was showing up well at the time of the death of the owner, when development work was suspended. The Standard mill, at Gold Hill, is running steadily on ore from the company's mines. The Standard Company is the largest gold producer in the district. P. B. Smith is still running his lixiviation works on low-grade ore from the Volcano mine at Stein's Pass. There is still a large quantity of ore on the dump to be treated. Another strike has been made in the Cook's Peak district, and there is now fully $100,000 worth of ore in sight in the mine. This camp is the largest producer of lead carbonates in New Mexico, and its development has only been fairly commenced.

OREGON.

PAY DIRT EVERYWHERE.—Grant's Pass *Courier*, Sept. 15: J. S. Plaster had his prospecting pan at work down on Rogue river, near its junction with the Applegate, last week, and found dirt which pays 25 cents to the pan. A five-mile ditch had been surveyed from the Applegate 16 years ago, to work these placers, but was not completed.

ANOTHER PLACER.—H. C. Smith last week struck a placer mine on the bank of Rogue river about two miles above town. An ordinary man can clean up $2.50 in a day of ten hours, and Mr. Smith thinks there is no need of a healthy man going hungry or getting broke in this country.

GOING DOWN ON THE EXCHEQUER. — W. G. Whorf, the mining man from Amador county, Cal., has bonded the Exchequer mine and will proceed at once to sink a shaft three or four hundred feet deep on it for the purpose of determining the lasting qualities of the ledge. Five or six men will be put to work, aided by the most improved drilling machinery, and Mr. W. thinks twelve months will elapse before any definite results can be obtained. Dr. Flanagan had already opened up the ledge for 75 feet or more and the ore gives indications of holding out at its present richness.

THE VIRTUE.—Baker City *Democrat*, Sept. 12: Dr. J. M. Meseroll, manager and treasurer of the Virtue Mining, Milling and Development Company, will arrive in this city to-morrow from Stockton, California. It is understood that a reorganization of the company has taken place, the bond on the Virtue mine from the owner, Geo. W. Grayson, of San Francisco, extended one year from next December, and that all things are in readiness for immediate resumption of operations. A new pump and other machinery has been purchased and is now on the way to this city. A new pump in place in the mine, the water now in the tunnels and shafts will soon be disposed of and the mine will be in a condition to give a large output of ore for reduction in the mill, which is in complete order for the turning on of steam.

CRACKER CREEK MINES.—Mr. Joseph Mikel arrived on the S. V. R. R. yesterday from Cracker City and reports good times in that mining district. The E. & E. mines and the Powder River Milling Company are employing a large pay roll and operations are being conducted on a large scale. The mill site of the North Pole Company has been graded, lumber is on the ground for the mill buildings and the shipment of 300,000 pounds of mill machinery purchased by the company in the East is now en route and is expected to arrive in Cracker City in a few days. The building of this large mill plant will cause a large employment of labor in addition to the 200 men already at work in the camp. In the country and mining districts tributary to Cracker Creek an advanced movement has taken on and there is great activity manifest.

UTAH.

THE EDA.—Bingham *Bulletin*, Sept. 17: The incline shaft on the Eda lode, located at the head of Cottonwood gulch, is now down about 300 feet and the vein being followed looks more encouraging than ever. About two and a half feet of good milling ore was encountered in the face of the incline last Saturday, and the operators feel very much elated over it, believing that it will develop into a fine body of first-class ore in a short time.

TO SHUT DOWN.—Tintic *Miner*, Sept. 17: Tommy Croxall, owner of the South Swansea, reports that he will ship one more carload of ore and then shut down the mine until the silver market improves. A marvelously rich gold strike is reported to have been made in the Mammoth on the 1000-foot level on Monday.

CRESCENT.—Park *Record*, Sept. 17: The tramway made its last trip on Thursday afternoon and has been practically closed down for the year. The concentrator will follow suit as soon as the present lot of ore upon which the mill is engaged is cleaned up. The reason given at the headquarters for the shut-down is that the company does not care to market its ore with silver at present quotations, preferring to store it at the mine, and feels that it will undoubtedly prove a wise move. About 50 men will be retained at the mine, who will be kept busy breaking down ore and in prospecting and uncovering new ore bodies and opening up more stoping ground. John Bogan is pushing matters at a lively rate on his Cumberland group. He has ordered a new Common-Sense whim which he expects to arrive this week, together with 400 feet of ⅝ wire cable. The work of jigging the second-class ore at the May Flower mine has grown into quite an industry and a monster dump is being built up. Four jigs are kept busy all the time. Up to date there is no sign of even a preparation to resume work on the Comstock, the favorable reports to the contrary notwithstanding. The only way to resume is to resume, for work speaks louder than words. Talk about a solid piece of machinery something with weight to it, and the big Cornish pump at Ontario No. 3 is decidedly in it. The walking beam that broke on the 4th of this month, when loaded on the cars ready for transportation to San Francisco weighed 140,250 pounds, or over seven tons. The beam will be repaired and a new one made so that in case of another break an extra one will be on hand. The contract has been let for the 500-foot tunnel to be run this fall and coming winter on the Dolberg group of claims, lying west of the Meears group. LeCompte, Rosscamp & Glenn got everything in shape Wednesday last and gave their concentrator a trial run. It moved smoothly enough, but the large water wheel did not develop power enough to drive the machinery as fast as desired, hence the engine they have in reserve will be put on. The ore concentrates very nicely and looks as if it should net the owners a fair profit.

ORE AND BULLION.—The Ontario mill shipped 41 bars of bullion this week containing 21,368.81 fine ounces of silver. The Marsac mill will ship to-morrow 10 bars of bullion, containing about 14,000 ounces of fine silver. Following are the ore shipments from the Mackintosh sampler for the week: Ontario, 645,840 pounds Anchor concentrates, 526,350; May Flower, 356,820; Silver King, 74.740; Daly, 210,060; May Flower concentrates, 44,000 pounds; total, 2,057,810 pounds.

WASHINGTON.

A SILVER MILL.—Okanogan *Outlook*, Sept. 13: The 60-ton concentrating plant of the Washington Reduction Company has commenced operations, and, as a matter of course, all who are in any way interested in the development of the mining industry, and especially those interested in the silver and lead mines of this section of the great Okanogan mineral belt, are most anxiously awaiting the results. The foundation for the great importance attached to this enterprise lies in the fact that it involves to a great extent the immediate prosperity of the entire mineral belt tributary to it, including the Ruby, Conconully, Lime Belt and Chloride districts. There can be no doubt that this mill is calculated to work successfully a considerable quantity of our ores, but not all of them, and owners of mines and mining claims will now have an opportunity to apply the test as to whether their ore is a concentrating ore and whether it will stand the cost of milling and shipping in that form. Should it prove that a large per cent of the silver-lead ores of this section can be worked successfully and at a profit by this process, it is impossible to overestimate the advantages that would acrue therefrom. It would make possible the development of a large number of claims by affording a market for the product and a source of revenue for the owners, the absence of which has heretofore been considered the greatest obstacle to the advancement and prosperity of the camp. The Washington Reduction Company is composed of Portland and San Francisco people and is officered as follows: President, D. P. Thompson; vice-president, Fred Holman; secretary, Jonathan Bourne. The directors and principal stockholders are Bays & Jeffreys, Preston Smith, W. K. Smith, Woodward & Son, Mr. Shepherd, C. P. Knowles and L. Wagoner. The company has a paid-up capital stock of $100,000. The mill is at present running on the ores of the First Thought and Arlington, which companies have contracted to furnish ore at the rate of 20 and 10 tons respectively per day for a term of three years. One-half of its capacity, which is 60 tons per day, is to be reserved for custom work. Mr. Wagoner has under his charge in the mill and mines a force of about 60 men.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Market Reports.

Local Markets.

SAN FRANCISCO, Sept. 22, 1892.

The local money market appears to be working closer, for warehouse men report firmer rates of interest on grain. The closeness of the market does not appear to be due so much to a lack of available funds as to banks wishing to be prepared for an emergency provided one comes. The active movement in mining shares is an unexpected, factor in some quarters, in the local money market, and its influence is closely watched. Heretofore a deal in mining shares went hand in hand with a more active demand for funds, which gave employment to large sums of money. For some time past brokers have not been able to employ any money, and in consequence the demand for funds from them has been *nil*. Remittances from the interior are coming in more freely. Some report that remittances from the country exceed the demand from that source.

New York mail advices to Sept. 17th report that cheap money markets in Europe and fair rates of interest in the United States are steadily weakening the foreign exchange market and pulling down quotations. On the 17th there was a renewed disposition on the part of bankers to sell bills for the purpose of employing foreign capital at New York. Bankers were also lending their bills against stock collateral, and the supply made in this way was assisting the downward tendency of rates. Commercial bills were not plentiful at last advices, but still there was some increase in the volume offering. Importers and remitters generally were not buying freely.

The New York *Iron Age*, Sept. 15, says: "The bank statement showed a decrease of $4,726,400 in cash and of $2,257,375 in surplus reserve, leaving this item at $7,630,000. The banks now hold only one-half of the surplus reserve of a year ago, the losses in five weeks past having been approximately $20,000,000. Loans were contracted to nearly $5,000,000. The discount rate in London is three-fourths per cent, and in Paris seven-eighths per cent, the lowest ever known there. In the West the demand is unusually active at the banks, grain receivers and provision packers being the principal borrowers, but requirements are expected to be much less than when there were larger crops to be moved and the pressure for shipment more urgent."

For the week under review general trade was fairly active with the volume of goods sent out, showing a decided increase over the preceding week. Although there appears to be an increase in general trade, yet the buying does not indicate that interior merchants will carry large stocks this winter. For our surplus fruit, fresh dried and canned, there continues to be a good demand from the distributing points at the East. Europe, it is contended by many, has been buying more freely of both dried and canned fruits.

With foundrymen and ironworkers, in general, business continues fairly active, although some report times very dull. The low prices ruling for raw materials are largely in favor of our manufacturers, but strong competition compels them to make close figures, particularly on large cash orders. The breaking up of the International Transportation Association is a source of some uneasiness and a general desire to learn what will be the next move. It now looks as if the railroad magnates in this country have been compelled to buy large quantities of their securities, which, if correct, will lead them to organize and work in such a way as to make money out of the investment, advance the price of the securities and sell out at good round profits, This, of course, will take time to bring about.

SILVER—The market continues to bang suspiciously steady. Heretofore, such steadiness has been followed by a rapid decline, but in this instance it is hard to forecast the future. According to all general rules of trade and commerce, the market value of silver ought to advance. From the best information obtainable, the conclusion is irresistibly drawn that the output of the mines does not equal the consumption. If this is correct, it will be only a question of time when the surplus of the silver mining counties will go into consumption. At present, the inactive money markets abroad and low rates of interest are against the metal. There was exported the past week $127,000 in bullion to China, and $166,000 in bullion to Japan.

MEXICAN DOLLARS—The market was fairly steady at around 67½ cents. There was exported the past week $187,175 to China, and $313,000 to Japan.

BORAX—Receipts the past week aggregate 220 ctls. There has been a good demand owing to the cholera scare. The consumption at the East in this direction is said to be very large.

QUICKSILVER—Receipts the past week aggregate 331 flasks, and the exports by sea as follows: To Auckland, 10 flasks; to Mexico, 27 flasks; total, 37 flasks. The demand is only fair. The market is barely steady.

ANTIMONY—The market does not exhibit any features worthy of notice. New York mail advices report that market quiet, at the following quotations: 10¾c@ 10½c for Hallet's, 11¼c for LX, and 12c @ 12¼c for Cookson's in round lots.

PIG LEAD—The market has been quiet. The September boom, which had been confidently looked for at the East, did not materialize, although four sales were reported at last mail advices. Consumers are cautious.

TIN—The market for both pig and plate has been quiet, with prices in buyers' favor. The season for the heaviest demand has passed. Eastern mail advices report an inactive market, with prices barely maintained. There was, at last advices, no speculative demand or any movement looking in that direction. London cables report a fair shipment of plate to this country.

PIG IRON—Liberal supplies on the way, low prices at the East and low freights by sail are against sellers and create an uncertain feeling with buyers, who do not appear to be buying beyond near-by wants, unless offered concessions. *Iron Age* reports the Eastern markets as follows: "The most encouraging development of the week is the certainty that the demand for pig iron is such that it is making inroads upon the stocks, and that simultaneously current production is even lower than it was at the beginning of August. The active capacity on September 11 represented a weekly make of 151,648 gross tons, against 155,136 gross tons on August 1. Our reports of stocks show a decline from 1,000,505 tons on August 1 to 937,882 tons on September 1, a falling off 62,623 tons. Philadelphia and Chicago report the pig iron market to be getting into better shape, while Cincinnati, the principal center for the distribution of Southern iron, reports a dull market. The Pittsburgh market is still struggling with its burden of Bessemer pig and is a little weaker."

COPPER—The market is weak and rather unsettled. London cables report that market unsettled by bearish operations of Paris traders. Late New York mail advices report that the supply exceeds the demand. The talk of increased production of Electrolytic copper having an unfavorable bearing on the market for the Lake product, and, doubtless, the competition of that class of metal exerted a certain amount of influence, since the product is as good as Lake copper for many uses and considerably cheaper. At last advices 11¾c was a common quotation for ordinary parcels, while sales were made at as low as 11¼c. For that matter, the last named price would appear to fairly reflect market value for wholesale quantities. Electrolytic was obtainable at 10¾c, possibly at a lower price, and on common casting copper anything above 10¾c for carload lots was the exception. The Bureau of Statistics reports the exports for the seven months ending with July as follows: Ore and matte in 1892, 331,245 tons; in 1891, 271,191 tons; ingot in 1892, 15,094,149 lbs. and in 1891, 39,724,311 lbs.

COAL—Imports the past week aggregate as follows: Sydney, 1913 tons; Newcastle, N. S. W., 18,294; Departure Bay, 1340; Coos Bay, 450; Nanaimo, 4006. Total, 26,005 tons. The market continues disappointing to the selling interest. There does not appear to be any snap or life to the demand, and to induce liberal buying, concessions were in order. Either consumers have liberal supplies or else there is a large falling off in consumption. The more general use of electric lights and electricity for motor power are largely against coal.

Mining Share Market.

SAN FRANCISCO, Sept. 22, 1892.

During the past week under review, the market has been quite active, with lively and attractive fluctuations in the Comstock shares. As the market gained in strength, with advances established, the outside public became more interested. The first decided buying by outsiders was noted on Monday, but the large majority of those who bought sold when a reasonable profit was in sight, only to buy back when the market shaded off. This trading, combined with the chippers' trading and rapid cross-orders by insiders, made the transactions partake more of old times, and brought joy to the heart of brokers and money to their depleted exchequers. As yet, chronic traders are rather suspicious and only buy for turns; yet there can be no question but they will gradually gain in confidence and buy more freely, hold longer, and, at the same time, bring friends into the arena. To educate the public to this point, the rings must continue to make an active market at higher prices, but when the former are inveigled into the business, they will be left with shares on which to pay assessments. With shares again well sold out, the days of large assessments will return. It is all nonsense to say the rings cannot induce the public to buy shares, for gambling appears to be inherited, and, with such a seemingly easy way of making money as appears to be offered by dealing in mining shares, it is an impossibility for it to be resisted. There are very few that sell out at a good profit, who can resist the temptation to buy back when prices go higher. In the excitement of a deal and an overweening desire to make money very fast, outsiders invariably come out in the end financially stranded. Six years' experience of writing on the mining share market has taught the writer that mining shares are, after a person has sold out and prices go higher, very much like the old woman's swine; if let alone, they will come home dragging their tails (assessments) behind them. The present move in the share market will not prove an exception, for it makes no difference how high the market will be forced, it will come back to low figures again with lines of assessments added. This will continue so long as the game is bullion for insiders and assessments for outsiders.

The market opened this morning weak and inactive, with only Belcher holding up. It looks as if Bob Morrow is standing under Belcher so as to keep the market from going to pieces. The support given to Belcher looks very much as if the rings have given instruction to prosecute certain work in the mine so as to make a much better showing than has, as yet, been made public. With a new and more important strike Mr. Morrow will undoubtedly, through cross orders, advance prices quite rapidly, by which means he will be able to carry out the reported instructions of D. O. Mills to load up the public with shares in any and every mine on the Comstock. It is a great game, this, of working the Comstock mines.

The official report of the ore worked and bullion produced for account of the Potosi mine at the Nevada mill for the month of August shows the ore was worked up to the unusually high percentage of 94 per cent. This is the same mill which returned such a low percentage on the ore milled for the Hale & Norcross Co. under the old management. Evidently the suit against the late directors of the latter company is bearing good fruit.

John W. Mackay is in Europe, Senator Jones is away, Alvinza Hayward is busy attending to the Hale & Norcross suit and also railroad matters, Francis G. Newlands is making his political canvass

in Nevada, ex-U. S. Senator James G. Fair is busy with his many money-making schemes, and James L. Flood, with his satellites, is away and yet the share market is active and bigber. This is accepted as confirming the report that D. O. Mills, while here, gave instructions to Bob Morrow what to do. Mr. Mills is putting up a very fine building in this city, besides, he is engaged in enterprises which require money, and a mining-share deal offers the best opportunity to get funds easily.

News from the Comstock mines report that so far the ore body developed in Belcher is more or less broken and therefore disappointing, but that work is under way from which much better results are confidently expected. In Sierra Nevada the ore, like that in Belcher, is more or less broken and disappoints all except members of the rings. It is said that the west drift lower down will probably strike a more compact body of ore, but how long a time it will take before striking the downward continuation of the ore remains a profound secret. On the 1750-foot level in Con. Virginia it is reported they struck $75 ore the past week. In both Hale & Norcross and Savage important work is under way. In several of the Gold Hill mines the work is of quite an important character, but whether the results will be made public depends largely on the success the rings have in peddling out shares. On the 1800-foot Ward shaft they are developing rich ore, but it is doubtful if outsiders will get any of the bullion when the powers that be are ready to extract and mill it.

Soon after the regular Call this morning, Belcher developed considerable strength, and, under manipulation, the price was sent to $3.65, which carried the rest of the market up. The price receded slightly but recovered, and at the noon hour $3.65 was bid. It has been so long between deals that the public appears mystified at the quick moves

At the afternoon call to-day the shares in Belcher and surrounding mines were strong and slightly higher. After the regular call Belcher was advanced to $4 05. Crown Point to $1.60 and Overman to 95c. This is an advance of from 300 to over 400 per cent on the prices one month ago. It looks at the close as if they had made the expected strike in Belcher.

*Assessment added.

IT may surprise many people to learn that there are in the United Kingdom nearly 4000 miles of inland navigation, upon which, on an average, 36,000,000 tons of goods are carried in the course of a year.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPT. 13, 1892.

482,614.—CAR COUPLING—J. N. Braun, Joslyn, Wash.

482,674.—LUBRICATING CUP—I. J. Briggs, S. F.

482,689. — TRANSPORTATION SYSTEM — L. F. Cook, Tacoma, Wash.

482,622.—DRAFT DEVICE FOR WHIFFLETREES—Q. V. P Day, Dinnha, Cal.

482,623. — STRENGTH-TESTING DEVICE—P. J. Dooling, Folsom, Cal.

482,342.— CUT-OFF CASK-FILLING FAUCET—J. H. Driller, Los Angeles, Cal.

482,342.—FOOT LEVER FOR MOWERS—L. L. Folsom, Stone House, Nev.

482,573.— MOVABLE STEP—F. Forster, Etiwanda, Cal.

482,484.— MACHINE FOR MAKING CHANNEL STRIPS—J. G. Lettelier, Los Angeles, Cal.

482,643.—VESSEL-CARRYING DEVICE—J. Mailliard, San Geronimo, Cal.

482,379—FIRE ALARM—J. C. F. McGriff, Los Angeles, Cal.

482,655.— TRANSMISSION OF WATER—M. P. Schelzel, S. F.

482 512.—STRINGING PIANOS—C. S. Weher, San Jose, Cal.

The following brief list by telegraph, for Sept. 13, will appear more complete on receipt of mail advices:

California—Mark Anthony, Berkeley, and W. C. Savage, Oakland, hung; Peter A. Boucbet, Merced, mechanical movement; Edward C. Binet. Clipper Mills, strap for hunching lumber; John T. Cocbran, Oakland, bituminous rock reducing machine; John Q. Finch, San Francisco, axle lubricator; Charles H. Randell and E. S. Pinney, Tulare City, calendar; Nicholas L. Rigby, Los Angeles, lawn sprinkler; Horace H. Taylor, San Francisco, ore separator; James Wilson, San Francisco, window frame and sash; Oregon—Martin Van Ensley, McMinnville, hydraulic motor; Charles H. Vandenburg, Florence, plow; Washington—Russell Avery, Spokane Falls, three patents, one for a coin operated automatic hydraulic air compressor, a second for an air pump or compressor, and the third for a device for operating pumps by means of treadles; John P. Holedger, Spokane, street railway switch appliance.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FEEDERS FOR COAL, ORE, ETC.—Louis Rosenfeld, N. Y. No. 482,652. Dated Sept. 13, 1892. The invention relates to that class of feeders for ore, coal and other material in which a supply-hopper is provided with devices for apportioning and regulating the charge fed therefrom. The main object of the invention is to provide simple and effective means for regulating the charge of material fed from the supply-hopper or bin and controlling its delivery. The particular object is to provide for simultaneously screening and delivering any stated quantity of coal from the bin and with the required speed to permit proper screening and safe delivery.

LUBRICATING-CUP.—Ira J. Briggs, S. F., assignor of one-half to A. W. Sanhorn. No. 482,674. Dated Sept. 13, 1892. This lubricating-cup is especially useful upon engine cylinders and in other places where there is a pressure of gas or vapor against which the oil or lubricating material is to be introduced. The lubricator is automatic and there is no chance for the escape of steam through it.

APPARATUS FOR THE PROPULSION AND TRANSMISSION OF WATER.—Marx P. Schetzel, S. F. No. 482,655. Dated Sept. 13, 1892. The invention is designed to be used for the propulsion and transmission of a body or column of water by means of a revolving disk having inclined or propeller-like overlapping blades, which blades extend over each other, and a chamber through which the water is either drawn by suction or pressed by force. The invention is used as a pump for raising or forcing and transmitting water, and also for the purpose of propelling vessels.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

ALAMEDA QUICKSILVER MINING CO. (of Chihuahua, Mexico). Capital stock, $100 000. Directors, S. M. Thanhausser J. L. Bradbury, W. E. Davis, R. B. Harper, F. W. W. Gollin and A. Krakauer.

FAUIT PEST EXTERMINATING CO. (San Jose). Capital Stock, $10,000. Directors—W. E. Ward, George W. Sill, J. R. Roberts, Henry Singleton, Henry Booksin, Jr., A. Miller and F. C. Strong.

WEEKS FISHING CO. Capital stock, $25,000. Directors—George Fogel, Albert Rowe, Daniel Hayes S. F. Weeks and J. G. Staiger.

KARLUK RIVER FISHING CO. Capital stock, $25,000. Directors—George Fogel, Albert Rowe, D. E. Hayes, S. F. Weeks and John J. Staiger.

GARDINER GENERAL ELECTRIC CO. Capital stock, $750,000. Directors—R. N. Graves, W. P. Wilder, William Van Bocklin, J. B. Gardiner, and Jacob Stadtfeld, Jr.

ACAMPO ORCHARD CO. (Sacramento). Capital stock, $80,000. Directors—P. E. Platt, M. N. Williamson, J. W. Barrett, H. R. Martin, F. G. Ryan, A. W. Porter, J. H. Platt, William Johnston and George M. Mott.

RAYMOND GRANITE CO. (Oakland). Capital stock, $300,000. Directors—F. E. Knowles, Albert Hosmer, W. R Hosmer, D. L. Knowles and James C. C. Martin.

AMERICAM DEVELOPMENT AND MANUFACTURING CO. Capital stock, $6,500.000. Directors—G. W. Osborn, H. S. Herrick, Henry Thompson. Ed Ewald and G. W. Osborn, Jr.

SIERRA WATER AND POWER CO. (Los Angeles). Capital stock, $200,000. Directors—George A. Haskell, H. C Oakley, A. J. Wallace, John W. Oakley and Frank S. Wallace.

SUMMERLANN DEVELOPMENT CO. (Summerland, Santa Barbara county). Capital stock, $10,000. Directors—J. W. Darling, Z. T. Croop, H. L. Williams, A. L. Bourquin and La Roy Prescott.

BONANZA MINING CO. Capital stock, $1,000,000. Directors—Adolph Weske, C. B. Hutchins, D. McDonald, Andrew Rodgers, I. L. Gould.

PACIFIC ASBESTOS CO. Capital stock, $1,000,000. Directors—A. P. Bacon, James E. Watson, J. L. Crichton, J. F. Halling, Thomas Bowhill.

PACIFIO MARINE RAILWAY CO. Object, to build dry docks. Directors—Alexander Hay, E. P. Schell, B. B. Madison, James Tyson and M. J. Madison.

SAN FRANCISCO AND CLEAR LAKE R. R. Capital stock, $3,000,000. Directors—J. C. Broadburst, J. W. Eisenhuth, Green Majors, C. V. Lodge and E. M. Greene. Object, operating a standard-gauge railroad from a point on the bays of San Francisco or San Pablo, in either the counties of San Francisco, Marin, Sonoma or Solano, thr ngh the counties of Napa and Lake to a convenient point on Clear lake, to the northerly extremity of Lake county; also, to operate steamboats and other vessels.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

MINING AND SCIENTIFIC PRESS.

The Leading Mining Journal in America. Established 1860. Latest Discoveries in Science and Improvements in Mining and Mechanic Arts illustrated or described. A Standard Illustrated Weekly published at $3 a year by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

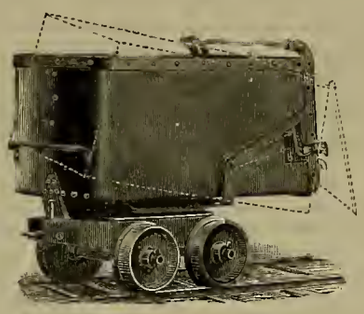
Propeller Boats Without Steam.

One of the daily papers of this city, in its "waterfront notes," says there is complaint about the naptha and gasoline launches, now increasing so rapidly, and maintains that they are a nuisance, because anybody can go as captain as they do not come under government laws. The suggestion is also made that the laws pertaining to steam vessels be amended by the next Congress to cover this new power. This is all nonsense. The vapor launch, like the safety bicycle, has come to stay, and is a modern mechanical device rapidly growing in favor. Under the Government laws it is almost impossible for any one to have a steamlaunch. The laws for them are precisely the same as apply to a big steamship. There must be a licensed engineer and a licensed pilot, etc., and the restrictions and regulations are such that few can afford to run the boats. This is simply because they have a steam boiler afloat. The Government then has more to say about running the boat than the owner. But the vapor launches, having no boiler, are independent of the Government. Any man can own and run one himself without interference. This he cannot do with steam, for the laws require the employment of licensed engineer and pilot.

The professional marine engineers take good care that no amateur obtains a license to run a steam-launch, and as a result few steam-launches are built. But with the new power neither the engineers nor Government can interfere and hundreds of the launches are being built. The engines for utilizing the gasoline are of California invention and manufacture, and are very successful. They are built small enough for a hunting boat or large enough for a good-sized yacht. Simple in construction, cheap to build and run, easy to handle, it is no wonder they displace steam in their field. The boat can be started at a moments notice, no time being lost in getting up steam as in the ordinary type, and, best of all, the owner can run his own boat without interference from officials or labor unions. Under these circumstances, calling this type of launch a nuisance because a few waterfront people object to it, is mere foolishness. Horse-riders and drivers wanted bicycles kept off streets and roads at first, but the courts decided they had as much right there as the horses, and now they are universal. The gasoline and naphtha launches have their rights on the waterways as well as sail, steam or rowboats. There is no reason whatever for the Government altering the laws pertaining to steam vessels to fit these boats. It is not because a steamboat is a boat that the Government looks after it, but because it carries a steam boiler. These boats do not require any more inspection or red-tape rules than a white-hall boat or yacht, or scow-schooner. They can keep out of the way of other craft easier because they are independent of wind, tide or muscle, and can back as well as go ahead. There is no need to inspect them or to require that the licensed member of some labor union should be in charge. They are bound in time to displace the old-fashioned small craft propelled by oars, such as white-halls, etc., and this is one of the reasons why there is a prejudice against them among those whose interests are involved. But the vapor-launch is a labor-saving, time-saving and money-saving device which has pushed its way to the front, and will be liable to stay there. Of late this class of engine has been put into small, bay-trading craft.

An Automatic Ore Car.

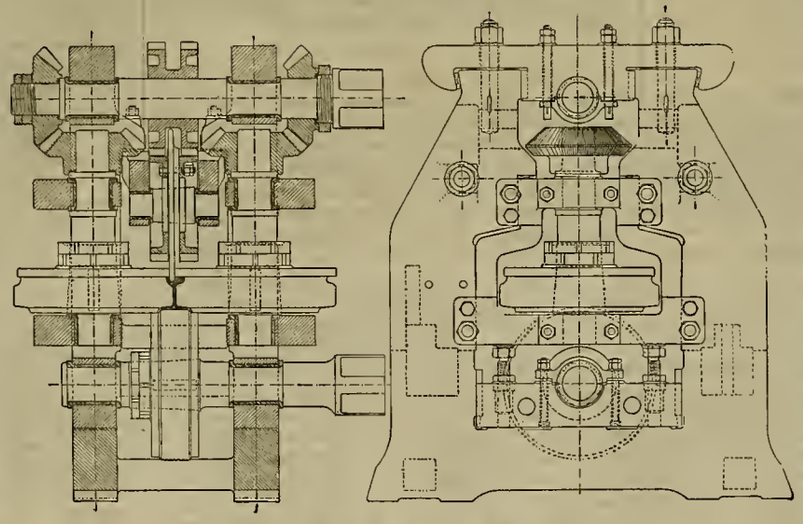
The Odin Mining Co., of Nevada City, Nevada county, have lately purchased some ore cars from the Parke & Lacy Co., agents in this city, which are different from any in use on this coast. They are known as the Truax automatic ore cars and are made of the best quality of steel and malleable iron with cast chilled wheels. As will be seen from the engraving, the automatic opening and closing door does away with the lever in the back and all its



THE TRUAX AUTOMATIC ORE CAR.

disadvantages. The car cannot be dumped without opening the door, and its opening gradually. The door does not commence to open until the bed of the car is at an angle of four degrees from the track, and from that on until the bed of the car is at an angle of 12 degrees. The door is held by two catches and a crossbar and opens gradually, thereby giving the benefit of the weight of the ore to the front part of the car to aid in dumping. The old style car door had to be opened before starting the dump, thereby letting about one-third of the ore fall out, thus increasing the weight to be raised to dump.

The door-catches start to catch the door when the bed of the car is at an angle of 12 degrees from the track, and from that time until it is closed down it acts somewhat on the principle of a wedge, making a tight fit of door and car. By the aid of the automatic door holding the ore in the car until partially dumped, we are enabled to set the trucks farther toward the door end, affording an easier dump than the ordinary car, and distributing the wear on the axles more equally. The step and catch are made in one solid piece and are so attached as to prevent the spring from becoming inoperative from ice or mud. The step and catch are attached with a bolt through the truck frame and step, so that by taking out the bolt the step comes out, affording easy access to the spring. The car works with a swivel, so that it can be dumped on either side as well as to the front.



FINISHING ROLLS FOR GROOVED RAILS.

To Secure Harmonious Action.

The clause in the Camminetti mining bill which provides that joint work may be done in the rivers under certain conditions, by the State engineers and those of the National Government, has been misconstrued by many as an attempt on the part of the originators of the bill to deliver over to the State the control of the river and harbor appropriations made by Congress. The object really is to secure harmonious action between State and Government engineers. If the State wishes to assist the Government, it may do so under the bill, but every step must be approved by the Chief of the U. S. Engineers and the Secretary of War as well. The Government engineers themselves advocate this system of cooperation. They have insisted that reclamation and improvement should go hand in hand, for unless this were done, one reclamation district would necessarily work at odds with another. Under the provisions of this bill, land reclamation and river improvement can be carried on by joint work on the part of the two sets of engineers. This is a sensible plan, and has advantages for both State and Federal Government.

Rolling Grooved Rails.

In the arrangement of modern rolling-mills abroad it has been earnestly sought to develop the old-fashioned crude trains into carefully-constructed machines, the gearing of which should not rattle loosely, but transmit power without loss, while the rolls should be placed with fine accuracy, and the pieces to be rolled should be moved back and forth in the precise predetermined position. In the latter respect, the rolling-mill at Phœnixhutte, Germany, may be adduced as a good model. Here, the liquid pig from the blast-furnace is transformed into ingot-iron in the converter, recarbonized and cast into ingots. These are annealed in Gjers soaking-pits, then removed by an automatic lever and delivered to a train of live rollers, which carries them to the blooming-mill, from which they pass to the bloom-shears and to the rolls without having required, since the metal left the furnace, a single pound of coal to be used upon them. Where room is lacking in the rolling-mill—which is very often the case in the older establishments since the requirements as to length of rolled pieces have been steadily advancing—feed-roller trains are used which incline upward and often extend far above the roof. The space below is thus saved for other purposes. Many mechanical devices have been put in use for the treatment of ingot-metal. In making the rails for street-railways, the ingot-metal rails are often rolled solid, receiving only in the last pass the necessary groove. The machine for doing this is shown in the accompanying cut.

PROF. GEO. F. BECKER, geologist, and Edward A. Schneider, chemist, both of this State, are among those on the U. S. Geological Survey whose resignations have been asked for and accepted by the Director.

Comment.

It is very evident that the electric railroad of the future will have to be on the conduit or storage battery system. Notwithstanding the arguments of the advocates of the trolley system, there is a prejudice against its adoption on the crowded thoroughfares of large cities which cannot be set aside. There is a menace in that pendant live wire which people object to. Every one is willing to admit that the trolley system answers very well as far as propelling the cars is concerned. It is cheaper in original outlay than the cable-road, but that it is cheaper to operate where there is heavy traffic is open to doubt, to say the least. If overhead wires on the roads were always kept in as good order as when first put up, there ought not be such serious objections to them. But when they wear so as to break frequently, the companies are not apt to renew them as promptly as they should. With cables, they must be kept in first-class order, and be renewed at certain known periods, or the whole road comes to a standstill. On an electric road in Oakland, not many months in operation, the writer saw last week the whole mass of wires at a curve near the end of the road, come to the ground at once. The conductor and motorman had to stand there for some time to keep children away from the dangerous wires. Where there is liability to such accidents as these, there will always be objections to the trolley. With the wire underground out of the way, or with the storage battery plan, the electric roads would grow in favor in the cities where they are now kept out. In this city only last week one road had to put up its wires at night, in opposition to the edicts of the supervisors, but under a court decision dissolving an injunction. With a more popular system of delivering the current to the motors on the cars, there would be no necessity of any such work, for the electric cars would be welcomed. There are many at work on plans for improving electric roads, and some more perfect plan than that in vogue will doubtless be the result.

On another page of the MINING AND SCIENTIFIC PRESS of this week is given the chapters of the Mexican mining law, relating to the methods of obtaining title and paying the annual tax on mining property. The idea is entirely new and will probably in time be adopted in other countries. Absolute title is given to the mining property on payment of a fixed sum for title deeds, and this ownership may always be maintained on payment of certain annual imposts. People owning mining claims in Mexico must present their ownership titles to the proper officials before October 31st, 1892, and pay for the proprietary mine stamps. This gives them undisturbed title to their ground. Then they must pay the annual tax of $10 for each claim unit, but this may be paid in three equal parts in advance in each fiscal year. Heretofore owners of mines in Mexico have had more or less trouble with the officials concerning their property, and this has been one of the great drawbacks to mining in our sister Republic. Under the new law, however, the prices to be paid are fixed at a specified sum, and as long as the annual taxes are paid no one can be disturbed or be submitted to official extortion. The receipts for payment of the annual tax are evidence of continued ownership, and form a more absolute title than the American system of affidavit of labor performed on the claim. In this country the annual tax is supposed to be spent on the mines; in Mexico it goes into the public treasury. Our system is good in theory but the plan of abandoning and relocating a mine gets around the law. Under the Mexican system there is no dodging the payment without losing title to the ground. Those portions of the law which we print in this number should be read by all who have any interest in mining ground in Mexico. The time to perfect the original title is short, and those who do not get the stamps for their title deeds this month will have a double bill to pay.

It is reported from Alaska that about 300 white men will pass the entire winter up the Yukon river, a thing never before known in that region. A few miners have occasionally stayed there, but most of them annually come back to the coast, and many return to San Francisco and pass the winter, returning early in the spring. Several pretty rich strikes have been made along the Yukon this summer, and in some places the miners are getting out from $8 to $18 per day. This no doubt accounts for their determination to stick by the diggings. The mining season in that region is short and every day counts. Nothing whatever can be done in winter, the cold being very severe. The men, however, probably want to be on hand when the first thaws set in so as to work the most of the mining season. To make anything in that region the diggings have to be rich since living is very expensive and the time for mining so short. There is enforced idleness for many months in the year. It is no place for poor men to go.

Sudden fortunes in mining are frequent, but sudden fortunes in fishing not so common. Since California began to control the whaling industry of the world, not many years ago, there has been a great change in the systems pursued. The best and most successful whalers are steam vessels and the modern explosive-bomb has entirely displaced the old harpoon. Moreover, the oil is no longer the chief object of whaling. Whalebone is what they are after, since in that there is the most money. As showing the possibilities of this industry, the last cruise of the steam-whaler Mary D. Hume (referred to on another page) may be cited. This little vessel by staying two winters at the mouth of the Mackenzie river, in the Arctic, comes back with a cargo valued at nearly half a million of dollars, breaking the record of all previous voyages. She took 38 whales. The bone is worth from $4 to $6 per pound, without counting the oil. In this case the vessel had no room for all the oil and abandoned most of the blubber, taking only the bone. Two years ago a whaling vessel brought back a cargo from the mouth of the Mackenzie river worth $200,000. Next year an almost equally valuable cargo was brought down from the same locality by one vessel. But the little steamer Hume is away ahead of them all. The lowest whaleman on the "lay" scale of this little vessel will receive not less than $2000, while the captain will get about $30,000 for his share. He is the only captain who remained two successive winters in the Arctic, and his persistency has found its reward. For the past few seasons the whaling industry has not been very profitable, but this marvelous catch will give it an impetus. The grounds about the Mackenzie river will be much hunted hereafter. The whaling fleet from the north is now on the way to San Francisco for the winter, though some of the vessels will remain in the Arctic in hopes of good catches in the spring.

THE new 80-ton State tug and fireboat Governor Markham, which was recently launched from the Fulton Iron Works' ship's ways at Sixth and Channel streets, has had her boilers and engines placed in her, and the fire-pumps will be put in immediately. Her cost will be $22,475, exclusive of the Dow fire-pumps, which are put in by special contract.

The New Anti-Debris Association.

What is called the State Anti-Debris Association, formed by five of the valley counties, met at Marysville last week and discussed the situation. "Will S. Green, of Colusa, was called upon, and he showed how a tax of 10 cents a year on $1000 of the taxable property of the counties interested would raise nearly enough to carry on the fight. The people of the several counties have not been educated up to this matter, and their papers have not taken hold of it in the right manner." Notwithstanding Mr. Green's statements the fact is, the people have been educated up in this matter, but not in the direction Mr. Green desires. They realize now that if the miners can work without injuring them they ought to be permitted to do so, and not be persecuted "on general principles." During the old fight on this subject everybody in the valley was down on the miners, and the miners themselves were rather too independent. But in these days the mutual rights are better understood. The miners no longer claim the right to mine anyhow, but recognize the fact that they must restrain their debris. They ask Congress for permission to build dams to control the debris, and the new Anti-Debris Association does not want such dams built. Debris now in the rivers will continue to come down unless dams are built, but this fact the anti-debris people ignore.

At a meeting of the Sacramento County Supervisors this week, Chairman Greer made a verbal report of the result of the meeting of the new Anti-Debris Association held at Marysville on the 22d, at which he and Supervisor Bates were present as representatives from Sacramento county. The counties represented were Sutter, Yuba, Colusa and Sacramento. Mr. Greer said that all the supervisors preeent were deeply in earnest and evinced a determination to have a stop put to hydraulic-mining. He and Mr. Bates assured them of Sacramento's support, but wanted to see more counties come into the combination—the eight that are most deeply interested—in order to lessen the expense of each. It was decided to hold a meeting in Sacramento on Monday, the 10th of October, to further consider the matter and endeavor, if possible, to get more counties interested, particularly Yolo, which has much at stake in the matter as Sacramento.

Referring to the matter of the expense of maintaining the work of the Anti-Debris Association, he said that himself and Supervisor Bates had given the others to understand that Sacramento would continue to aid in combating the operation of hydraulic mines. The expenses of the association in the past had averaged about $1000 a month, which had been borne mostly by three counties—Yuba, Sutter and Sacramento. While the contract of this county with Attorney Devlin lasts, the sum paid him ($200 a month) would be credited to Sacramento as her portion of the expense, but if seven or eight counties can be induced to join the association, the expense to each will hereafter be greatly reduced. Mr. Greer then spoke of the presence of Congressman Caminetti before the Association, who had been invited there for the purpose of explaining his hydraulic mining river-improvement bill. He said that after hearing Mr. Caminetti's explanations of its provisions, in their amended form, the members of the Association were much more favorably disposed toward it than before. It leaves the matter entirely in the hands of the Government and has certainly many good features that are worthy of careful consideration.

The fact is, if these gentlemen will take the trouble to read the bill which passed the lower House of Congress at the last session, they will see that there is an earnest attempt on the part of the miners to prevent any further damage from debris. At the same time they want to work their mines.

Mr. Caminetti's idea is to first take care of the material that now lies in the main branches of the rivers and their tributaries, which is now doing injury to the navigable streams and their tributaries, and the lands adjacent thereto. Once having taken hold of the matter, the General Government will push it to a final and satisfactory solution, if it be in the power of engineering skill and science to solve it. As early as 1882 the Government engineers appointed to examine into the question reported there was a feasible plan which might solve the question; and it was upon that basis that the Biggs Commission made their report, and, in fact, they adopted in many instances the language of the Mendell report of 1883. The recommendation of the commissions is made a part of the bill that passed the House of Representatives. A detail of engineers appointed in 1890 approve of the report of the report of the Biggs River Commission, in so far as it relates to the many streams. There is another report that corroborates and coincides with all the former reports made by the engineering department of the Government, and that was made in answer to a law passed at this session of congress, calling upon the Secretary of War to submit for the consideration of the Houses, estimates in

regard to carrying out the Biggs Commission bill; and in that it is found that they, with the approval of the Chief of Engineers and Secretary of War, go upon the theory that is outlined by those reports referred to. In all of these reports it will be found that no harm is intended to the people of the valley, and there is entire safety to the land adjoiniug the rivers; and this idea is carried out thoroughly in the law which passed the House on the 19th of July. It appoints a commission of engineers to take charge of the general subject of the rivers, including the Sacramento and San Joaquin system and the hydraulic mining that may be carried on in the country drained by either of these streams. The main proposition and prevalent idea of it is to complete river improvements—complete river protection.

If the new Anti-Debris Association showed a spirit simply of protecting the valley interests against possible injury, no one could object to its mission; but its spirit seems to be more in the direction of stopping the mines anyhow and not permitting dams to be built. The same men who were in the old association are in this one, and they seem to want to carry on the contest about the old lines. The time has passed, however, for that. The people generally want the controversy stopped. The miners are anxious to do the right thing if they are only permitted. The antidebris men themselves confess that they have been unable to stop hydraulic mining, and that it still continues. It would seem, therefore, that the old plans were unsuccessful. Possibly by a more liberal and less antagonistic spirit, better results could be accomplished.

Coast Industrial Notes.

ONTARIO, San Bernardino county, has let the contracts for the municipal water system.

GREAT FALLS, Montana, is to have a 500 barrel mill and elevator, which is to be built by Minneapolis millers.

AT Eel river the canneries are all busy, and more or less work is being done in the planing mill and box factory.

THE cannery at Eugene, Oregon, employs fifty hands in preparing fruits and vegetables for the market. They have canned about 80,000 pounds of tomatoes this season among other things.

THE water ditch to be built this fall in Oregon for the Canyonville Mining, Water and Manufacturing Company will he nearly fifty miles in length and will cost between $70,000 and $100,000.

WORKMEN have commenced stretching the trolley-wire for the Sessions-Vandercook electric road from the corner of Eighth street and Broadway, Oakland, to East Oakland. The tracks have been laid for some time.

Reports are made of a valuable find of coal at Chicnic bay, Alaska, half way between Sand Point and Kodiak. The prospectors have sunk a shaft and are getting out the coal. The product of the mine is said to be first-class.

THE motors and trucks for the new Fourteenth-street Electric Railroad in Oakland have arrived, and it is expected that the cars will be running from the Sixteenth-street depot to Fourteenth and Washington streets in another week.

GREAT excitement was created at Whatcom, Wash., over the report that a vein of coal fifteen feet thick had been discovered within the city limits. The vein was struck at a depth of 400 feet, and the specimens shown are of excellent quality.

THE California Wire Works Co. has asked permission of the Supervisors to build a railroad from the seawall on the waterfront to its factory, along North Point street, thence on Powell street, with privilege to use either steam or horsepower.

THE tug Katie O'Niel which returned several days ago from Port Harford where she has been towing rock barges for the work on the Government breakwater, will perform a similar duty on the Oakland harbor improvement, her owner, Patrick O'Niel, having entered into a contract for the work.

Vancouver, B. C., has given the Burrard Inlet and Fraser River Railroad Company a subsidy of $300,000 on condition that it construct a railroad from Burrard Inlet to the United States boundary at Sohome bay. The road is to be completed before June 30, 1894. The company agrees to erect machine and repair shops at Vancouver.

Messrs. Harlan, Green and Bartlett of this State have discovered a mammoth quartz ledge at Preston Peak, 20 miles southeast of Waldo, Oregon. Several locations have been made along the line of this immense ledge, and work will be pushed vigorously in the spring. The locality is high up in the Siskiyous, where the snow lies in drifts to a depth of fifty feet. The region, although inside the California line is only accessible by way of Grants Pass, Oregon.

THE Metropolitan Electric Road, which is to run all the way to the ocean, is so affected by its franchise that only a five-cent fare can be charged between the city and the ocean. To go out to Southside will necessitate the doubling of the power. On motion of C. W. Pope, president of the Southside Improvement Club, a subsidy of $125,000 was voted to extend the road from its present terminus at Eighth avenue, via T and Forty-eighth streets, to the park and ocean.

THERE are in this city at present many idle coast-seamen and deepwater sailors. There are not enough coasting vessels now on commission to furnish employment for them and now the winter is coming on, matters will be worse. There are many deepwater ships waiting for wheat, so that the sailor boarding houses are filled with men out of work, and they are taking the places of the coast-seamen when they can.

A new granite quarry belonging to J. J. Stone, fifty miles east of Spokane, is having spur-tracks built to connect with the Northern Pacific railway. This quarry is to furnish the stone for the new municipal building at Spokane. Nelson Bennett, of Tacoma, the lowest bidder for the government naval docks at Port Orchard, as soon as the contract is ratified, will order the granite in the construction of these docks, from Mr. Stone's quarry. This will entail another additional force of workmen at the quarry and will probably increase the number to three or four hundred men.

AT present over 175 tons of bitumen are hauled daily from the mines of the Bituminous Consolidated Mining Company up the coast from Santa Cruz, and there are orders for 10,000 tons to be hauled before the rains set in. Santa Cruz bitumen is being laid on First street, San Jose, from Santa Clara street to the hotel Vendome, about 1¼ miles, and also at Stockton, Alameda, San Francisco and Oakland. Recently 2,000 tons have been shipped to Salt Lake, to be used for street purposes. From the Enright mine about thirty tons are hauled daily, bringing the output to over 200 tons.

Under the authority of the last naval appropriation bill, providing for the construction of an 8000-ton seagoing battle ship, and an 8000-ton armored cruiser, proposals were on Wednesday issued for their construction. The battle ship must have an average speed of sixteen knots an hour, and the cruiser twenty knots. The speed is to be maintained successfu ly for four consecutive hours on the trials. The vessels must be completed within three years from the date of contract. The Union Iron Works of this city will bid on both vessels, with a good chance at least of getting the battle ship to build.

ALL the firms and establishments engaged in the bottling of Fredericksburge beer in the city have combined. They have pooled all their issues and will he known under the corporate name of the "Fredericksburg Bottling Company." The corporation will have a capital of $100,000, all of which has been subscribed. It appears there are five different concerns operating in this city as bottlers of Fredericksburg beer. Over 150 men are employed among them and each establishment is under the expense of having independent management, The entire work will hereafter be concentrated at one establishment, and the four other places will he closed.

CHAS. E. UREN is now engaged in making surveys for the dam and canal of the Electric Power Company, which will obtain its power from the South Yuba river. The dam will be located about two miles above the Purdon bridge, at a point where high rock cliffs narrow the stream. The bottom of the dam will he less than forty feet in width, but nearly 150 at the crest of the dam, which will be 27½ feet in height. The work of building the dam is to be pushed to completion before the rainy season sets in. The construction of the canal will be carried on through the winter. Much of this work will he fluming, owing to the steep hillsides along which it will have to be carried.

The tunnel on the Great Northern under the summit of the Cascade mountains will be 13,000 feet long instead of 8,000, and will require three years to complete it instead of one. When completed it will be the second longest tunnel in the United States, the first being the Hoosac tunnel in Massachusetts, four and one-half miles long. The final location of the tunnel is now being made by A. M. Lupfer, resident engineer. The switchback over the moutain has been located and is now under construction. At one point the line passes back and forth six times on the same side hill. The difference in elevation between the summit and the point where the switchback joins the main line is 1,000 feet.

THE sea otter schooner Pearl returned Tuesday from her cruise north with sixty-eight skins, and bringing news of the season's catch, which has been most successful as well as profitable. The Pearl is eight and a half days from Kodiak island, and her skins were taken in the vicinity of that and Sanak island. Captain Littlejohn spoke the sea otter schooner Helen Blum, Captain Coulson, with ninety-one skins, which makes her "high hook" of the season; the schooner Herman with seventy-eight skins, the Alexander with fifty-six skins, and the St. Paul with fifty-one skins. These vessels fitted out here last February, and the news that came Tuesday put the owners of the vessels in high spirits. Sea otter skins bring from $175 to $250 apiece, so the catch is worth considerable.

MEYER & AKMANN, agents of the steamer Emily, have a contract to transport 400 tons of steel rails to Marshfield, Or., for the Coos Bay and Roseberg railroad, which is to be built as soon as possible to Coquille City, a distance of about twenty-two miles. The road is already built ten miles out of Marshfield and graded for eight miles more. The steamer on her last trip brought down from Port Orford, Or., 200,000 feet of piles, which were landed in Oakland creek, where they will be used in building the wharf for the Adams estate at the foot of Jackson street. The Adams heirs are building 1600 feet of wharf frontage, alongside of which they will have a depth of 22 feet of water for shipping purposes. Much of the timber is on the ground and the contract for dredging will be let on Tuesday next.

THE steamer Bertha brought news from the Artic this week that the steam whaler Mary D. Hume was on her way down the McKenzie river with bone and oil representing thirty-eight bowheads. The catch is the largest on record, notwithstanding that it represents two seasons's work. When the Hume left here in April of 1890 to winter at the mouth of the McKenzie river there was considerable misgiving over the experiment. No one ever anticipated anything like such success as she has had, and when she reported eleven whales at the end of the first season the statement was doubted until 15,000 pounds of bone arrived consigned to her owners. Captain Tilton staid another year, and the result was twenty-seven more whales, making a total value for the two seasons of between $400,000 and $500,000. The Grampus tried it last season and made a phenomenal catch, but nothing to compare with the Hume's. The Newport, Karluk and Orca arrived off the mouth of the McKenzie in June of this season, but the Hume, not having to wait for the ice to break up, had been hunting for two months and had skimmed the cream of the hunting ground. The Orca had two and the others three each when the Hume sailed, and it is possible that they may conclude to do as the Hume and stay through the winter, but this will not be definitely settled until the mail arrives here by the lucky steamer. She sailed from Dutch Harbor three days in advance of the Bertha and may he expected any day. She brings 40,000 pounds of bone and oil enough to float in. The bone taken during this season amounts to 40,000 pounds and at an average lay of 1-190th the forecastle hands will receive from $2,000 to $2,500 each as salve for their privations. The boat-steerers, boat-headers and mates will double this figure, and Captain Tilton's bit will not fall short of $32,000. The Hume only had three boats out, as against six to eight for her late competitors. They had to throw most of the blubber away having no room for it all.

Personals.

A. P. MINEAR, the well-known mining man is in the city on a visit.

P. KERWIN, the Comstock mining superintendent, is in town for a few days.

MAJOR J. W. POWELL, director of the U. S. Geological Survey, is daily expected to arrive in San Francisco.

MR. H. J. SMALL, master-mechanic of the Central Pacific R. R., came down from Sacramento on Wednesday.

GEORGE A. REYNOLDS and G. L. Bishop have come down to Stockton for the winter from their mine, the True Fissure, in Gold Valley, Sierra county.

PROF. REED, of the Cleveland University returned this week from Alaska, where he has passed the summer in scientific investigation of the Muir glacier.

SUPERINTENDENT TIBBEY, of the Parrot mine, of Butte, Montana, has earned the gratitude of the miners by the perfection of an effective system of ventilation.

JAMES L. FLOOD and Nat T. Messer left this week for the Comstock to inspect the work going on in the mines, more particularly the cross-cutting on the 1800-foot level of Hale & Norcross.

AT the meeting of the Technical Society of the Pacific Coast, on October 7th, C. A Stetefeldt, E. M., will read a paper on the "Curriculum of a Modern College; Classics vs. Natural Sciences."

A. PAGE BROWN has been appointed architect of the Harbor Commissioners. This is a newly created office, necessitated on account of the new ferry buildings that are yet to be fully planned and delineated.

F. W. DICKLE, of Pioche, has been investing pretty heavily in Monkey Wrench property, having purchased a half interest in the Cedar, Center and Big Baser. He intends to do some extensive development work in a short time.

MR. VICTOR C. HEIKES, of Salt Lake, who has spent a week investigating the workings of the cyanide process at the Mercur mill, Utah, writes us that he finds it to be a success on the ore that they mine. The mill is treating an average of 25 tons of ore per day, and their cleanup last month showed they were extracting an average of 83 per cent of the gold contained in the ore.

Building Government Vessels.

SAN FRANCISCO, Sept. 27th, 1892.

TO THE EDITOR: The MINING AND SCIENTIFIC PRESS is quite right in condemning the idiotic policy of the Light-house Department in building vessels in the interior of the United States which are designed for use in these waters. Economy and the best interests of the public service would suggest that the Board avail itself of our excellent facilities for ship building without our potential Representatives intercession, which would only serve to ruffle the consecrated oil of the Department and be regarded as a piece of sublimated cheek. It is hoped that "Columbine" will prove to he a superior vessel to her bison-back predecessors, and that if a naval officer be detailed to bring her out that she will hold together long enough to reach her destination.

Respectfully, W.

DEPARTS FOR THE EAST.—On Wednesday last Captain Jeremiah Miller, the well-known miningman, took his departure for the National Capital, where he will stay for some time. Captain Miller, who arrived in California in 1853, coming from Pennsylvania, his native State, has lived here continuously ever since, having been engaged in many heavy mining operations of various kinds in both California and Nevada. He was noted for his sound judgment and energy, a marked success having attended nearly every enterprise that he originated or ever helped to promote. He put up the first quartz-mill built in central Nevada, also the pioneer mill at White Pine, and which, beyond any doubt, turned out more bullion than was ever before produced by any mill of like capacity. Captain Miller has, during his long sojourn on the Pacific coast, experienced his full share of the vicissitudes incident to a business noted alike for its successes and its failures. His mining ventures have, however, proved generally fortunate. Where other results were reached this was largely due to disastrous conflagrations, the occurrence of unforeseen accidents, or the mistakes of others. Captain Miller, who leaves in the enjoyment of vigorous health and unimpaired business capacity, carries with him the respect of every one who ever knew or did business with him, and all of whom join in wishing him continued prosperity and a full measure of days.

The Age of Gold.

SAN FRANCISCO, Sept. 24, 1892.

TO THE EDITOR:—The age of gold is a question I have heard discussed at various times in the past, and latterly but a few days since. As a matter of course, this, like almost every other geological question, finds supporters for many theories Some gentlemen of my acquaintance believe gold to be of very recent geological age. Possibly a reason for this may be found in the recognized age of the great auriferous gravel deposits of California—the pliocene, and extending into the post-pliocene or quaternary. The age of the famous Blue Lead and the gravel deposits is undisputed, but the gold, though found in vast quantity, comparatively speaking, was by no means formed during this very recent period. That the gold found in these old channels and in the more recent quaternary alluvial deposits came originally from the quartz veins and schists of the "gold belt" no one who has investigated the matter can doubt. The age of the auriferous slates is not a point upon which all geologists agree. H. W. Fairbanks, of the State Geological Survey, seems to have collected well-founded data placing these rocks in the jurassic period. His conclusions in this regard will be found in the report of the California State Geologist for 1890.

Gold is now known to occur in many lava rocks of comparatively recent age. The rhyolites and andesites are gold hearing in many places and these rocks are usually believed to have been erupted in tertiary or even post-tertiary times, but the precious metal is found in rocks still older than any that have yet been mentioned.

It is true that gold is found in greater or less abundaoce in some carboniferous rocks and in the still older Cambrian and other silurian strata, but the deposition of the metal in these rocks seems to have resulted from the intrusion of certain eruptive rocks—rhyolite, trachyte, quartz-porphyry and other lavas of the tertiary and pre-tertiary (post-cretaceous) time—so the finding of gold under these conditions would have no hearing on its age as related to the rocks in which the ore deposits occur. In fact, its occurrence under these conditions would seem to confirm the very recent age of gold.

In the Black Hills of Dakota gold is found abundantly (that is, if a production exceeding $40,000,000 from a single group of mines included in an area 6000 feet long by about 1600 wide may be called abundant) in rocks of archæan time, the oldest known formation.

In the Homestake, the Caledonia, Golden Terra and Deadwood mines of this group occur masses of porphyry which have heen thrust up from below, and there is little doubt these dykelike masses have had a direct influence upon the deposition of the gold now found in these mines. The age of the felsite found in these mines is generally conceded to be post-cretaceous.

There exists, however, indisputable evidence that the schists and quartz of these mines were gold-bearing millions of years before the porphyry was forced in from below. This evidence is found in the conglomerate which directly overlies the archæan rocks, the unconformity being most distinct, the angle sometimes approaching 90 degrees and always being over 45 degrees. In this conglomerate, which is locally called the Gustin Belt, gold occurs under conditions almost identical with its occurrence on the Blue Lead of California. It is, in fact, a consolidated placer deposit, in which the sand, mud and pebbles composing it have been so firmly cemented as to make it a solid rock, in which the pebbles are as likely to fracture as the cementing material. The cement mines of the Gustin Belt have produced a very large amount of gold, nearly all of which was derived from the Great Homestake Belt above referred to. Not a single pebble of the felsite is found in the conglomerate and the closest inspection only leads the observer to conclude that the gold existed in the archæan rocks long before the waves of the Camhreo-Silurian sea dashed over them, tearing down the archæan terrane to build a new land. The Gustin Belt is one of the most interesting features of the economic geology of the Black Hills region and will he treated more fully in some subsequent article.

Presuming that the evidence above offered confirms the finding of gold in the archæan, it would seem that the argument that gold occurs only in rocks of comparatively recent time is wlthout suhstantial foundation.

W. H. STORMS, E. M.

Have We a Mark Twain Among Us?

TO THE EDITOR:—The terrifying suggestion has been made by a trembling friend of mine that M. T. may mean MARK TWAIN! The said T. F. fears that I may come out second best in a "keen encounter of our wits" with that redoubtable champion. In truth, I doubt if Mark Twain would do better than M. T. has done in his article of Sept. 17th, which hears internal evidence of authorship hy one who has "never dared to write as funny as 'he' can;" and if he *is* Mark Twain, of course I am in great danger.

But whatever the meaning of the mystic symbol, I warn M. T. that an arrest without a warrant is only lawful in case the culprit is caught in *flagrante delicto*. In other words, lacking the warrant of authority, a warrant must be shown in the facts and the facts must not be perverted nor misconstrued. This kind of warrant will be admitted hy everybody, for, in science, no authority is too sacred to he questioned *for cause*.

By making arrests without due grounds for such proceeding, M. T. has exposed himself to the serious charge of inciting to man's laugbter; also, of being bnt an M. T. vessel. Fortunately, these little circumstances will not diminish the value of any *new facts* which the gentleman may present to us. C. H. AARON.

Taxation of Mines in Mexico*.

The New Method of Obtaining and Maintaining Titles to Mineral Ground.

SECTION 1. Conformably to the directions of the new mining law there is hereby established a Federal Impost (tax) of mining property consisting of two parts, viz.: First, a payment in stamps, to he attached to every paper title to mining property, which may be exacted but once; and, secondly, an annual payment for each claim composing tbe grant (concession).

In determining the impost, the ground to be taxed shall he the mining claim or unit of concession, as defined by Sec. 14 of the new mining law (*i. e*, eacb 10,000 square meters.—ED.), and, as a corollary thereto, the same shall apply to all claims existing in the Repuhlic, new or old, whatsoever be their extent.

In regard to fractional claims which reach or exceed one-half thereof, the tax shall be imposed as if the unit were complete and no tax shall be imposed when the fraction does not reach the said limit.

SEC. 2. Every owner, or actual holder of a mine by any title soever, must present his evidence of ownership, without fail, after the promulgation of this law and before Oct. 31st of the current year, at the office of the Treasury as required by this law, to the end that new proprietary mine stamps he affixed, and that the extent of the claims composing the property he noted for the payment of the annual tax, which shall he registered accordingly.

The paper titles which may hereafter issue from the Department of Public Works (Fomento), conformably to the new mining law, must bear the proper stamps to be furnished hy the grantee and according to the numher of claims embraced in the grant.

SEC. 3. Proprietary mine stamps shall be of the denomination ot $10 and shall he attached to the paper title in the proportion of one for each claim of 10,000 square meters, and, for fractions, an amount as provided in Sec. 1 hereinbefore.

Said stamps must he canceled by the Treasury Officials authorized to accept titles, which may be issued up to June 30th of the current year. Such as are issued in accordance with the new law must be canceled by the Department of Public Works (Fomento).

SEC. 4. After the first of July of the current year every owner or holder of mines must make an annual payment of $10 for each claim unit embraced in his grant.

The amount of the impost shall be the same, whatsoever be the nature of the substance exploited, whether the mine was acquired before the date when the new mining law went into effect, by location (denuncio) or by special grant, or hereafter acquired hy grant and title under the new law. There shall he excepted from the payment of the annual claim tax and proprietary stamp tax as prescribed in Sec. 1, such mines as have, by Executive compact in virtue of an authorization of the Legislature or with its approval, been expressly exempted therefrom. This exemption shall continue during the stipulated time limit of the grant and shall not he extended.

SEC. 5. The annual tax of mining property shall be paid in three equal parts in advance in each fiscal year, and in the first month of each of the said periods at an office of the Treasury (Hacienda) in accordance with the requirements of this Law; and the parties owning the same must present themselves to make said payment without further notification and without delay or making excuse.

SEC. 6. Failure to present the evidence of title to a mine within the time limit fixed by Sec. 2, shall be punished hy a fine equal to the amount which the paper titles should hear; provided this he presented within the space of two months, and, for each additional two months of delay thereafter, the mineowner shall pay a fine equal to the amount of the stamp tax.

Any concealment of the numher of the claims shall be punished by a fine equal in amount to double the payment in stamps required for title on the claims so concealed and in addition to double the amount of the annual tax due during the whole time of sucb failure of payment, without prejudice to the civil or criminal responsibility which shall he enforced at the proper time. A failure to pay the annual proprietary tax within the first month of each of the said periods shall impose upon the owner of the mine a fine equal to fifty per cent of the tax, provided such payment he made within two months. If the payment be made in the third month, the fine shall equal the tax.

If the last mentioned term limit he passed without payments as aforesaid, all proprietorship in the mine shall be lost without recourse and the Department of the Treasury shall so declare and so publish in the Official Gazette in order that it may be open for another applicant.

SEC. 7. Whenever the owner of a mine shall alienate the same, he must give notice, so that record may he made thereof and so that the deed may be stamped in accordance with the Stamp Law.

SEC. 8. In the case that a person or company shall not see fit to continue the exploitation of a mine or mines in possession, written notice thereof must be given to the proper office of the Treasury in order that the tax may be paid up to the date of advice of abandonment and a proper record thereof made.

Mexico, June 6, 1892.

TITLE TAXATION.

SEC. 1. Mineral estates, now in being and such as shall hereafter be granted by tbe Department of Public Works (Fomento), conformably to Sec. 3 of the regulations of the 4th of the present month, shall be subject to the taxation imposed by this law. The mineral estates, set fortb in paragraphs III and IV of the first section of the Mining Code of Nov. 22, 1884, shall not, however, in the matter of imposts, be subject hereunto, but only to the law of June 6, 1887, and other enactments in force.

SEC. 2. The taxation of title deeds shall he paid by affixing to the last folio thereof, presented by the party interested, such stamps as are proper for papers and books, in accordance with Sec. 3 of the law. These shall be canceled in the manner therein provided.

SEC. 3. Every owner or actual holder of mines, as related in Sec. 1, is peremptorily directed to present to the head offices of the Treasury in the States, or to the offices of the Revenue in the Territories, by or before Oct. 31st of the current year, subject to the penalties imposed hy the law, the following, viz.:

I. The title papers, on which possession is based, conformably to Section 4, Chapter 6, of the Law (Ordenanzas) of May 22, 1883, and Sec. 9 of the Mining Code of Nov. 22, 1884.

II. The last title paper, transferring ownership, in case the actual owner or holder be the successor in interest of the original locator.

III. Duplicate papers, verified under oath, setting forth in detail the name and domicile of the owner or holder, and, if such be the case, of the Incorporation and of its manager or representative; the compass bearings and extent of the claims or surplus ground, with accurate measurements thereof, stating whether they be connecting or interrupted; the sum total of the original claims and surplus ground so held; the equivalent thereof in hectares, according to the terms of Sec. 14 of the law of June 4th of the current year, and of Sec. 4 of the Instructions thereunder, and, if such be the case, the reduction to writing of the title sought for by the informant, according to Sec. 4 of the provisional instructions of the said law and Sec. 8 of the law of June 6 of the current year.

SEC. 4. The presentation of the title papers, referred to in the preceding section, looks only to the identification of the mine and the verification of the claim area, expressed in hectares.

SEC. 5. The Officials, mentioned in Sec. 3 hereof, shall at once return to the party in interest one of the duplicate copies, after having noted upon said paper the day and hour of its presentation and shall forthwith affix, to the last conveyance, the appropriate stamps.

SEC. 6. Within the three days, subsequent to the attaching of the stamps by the Officers of the Treasury or Revenue Service, the official papers (expediente) shall be forwarded to the Treasury Department, which shall set forth the facts and foundation for accepting the correctness of the statements, made hy the party interested.

SEC. 7. After receipt of the information according to the terms of the previous section, the Treasury Department shall, after such investigation as may he necessary, decide whether to accept or refuse the proofs offered.

SEC. 8. In case the Department, as provided for in Sec. 6, hold the proofs offered to be correct, the paper title shall be returned to the proper Treasury or Revenue Officer to he delivered to the party in interest. The duplicate, described in Sec. 5, shall have endorsed thereon the statement that the tax has been paid.

SEC. 9 If the Treasury Department does not hold the proofs offered by the party in interest to be sufficient, the said Department shall fix the number of claims for which payment in stamps must be made.

SEC. 10. Within the three days following the day of the notification, contained in the preceding section, the party in interest must advise the Treasury Department that he accepts the number of claims fixed thereby. Allowing this period to pass shall be held to be conclusive evideoce that he agrees thereto.

SEC. 11. In case the party in interest does not agree as to the number of claims so fixed, the Treasury Department shall nominate an expert, who after inspecting the official documents, survey of the land and mining property, shall present a written opinion on which shall he based the final ruling of the Department.

SEC. 12. Having the report of the expert in view, the Treasury Department shall announce its final ruling and shall return the official document (expediente) to the Office of the Heads of Department of the Treasury and Revenue, in order that the amount of stamps which may be lacking may he thereunto affixed and notice thereof shall be entered upon the duplicate. If the case have merit, the applicant shall be referred to the Courts, conformably to paragraph II of Sec. 6 of the Law of June 6, 1892.

SEC. 13. Notice must he given to the Treasury Department, conformably to Sec. 37 of the Regulations of June 25, 1892, of all grants hereafter issued hy the Department of Public Works, upon which the proper stamps have been attached.

SEC. 14. Grantees of mineral zones, who do not avail themselves of the privileges, allowed in part second of Sec. 3 of the Instructions of the Law of the 4th of the present month, must appear in person before the Treasury Department and present, in duplicate, the documents, required by the wording of Sec. 3 of these Regulations, which shall set forth the date of the respective grants and also whether there be embraced within the boundaries of the said zone any mineral claims, other than those so granted.

SEC. 15. The Treasury Department, in view of the proofs (manifestacion), presented in accordance with the terms of the preceding section, shall demand of the Department of Public Works a written declaration thereof and sball rule according to the facts so communicated and shall give to the party in interest the authorization (resguardo) to render operative the concluding portion of Sec. 4 of the law of the 6th of the current month.

SEC. 16. In like manner, grantees of zones which include claims within their boundaries other than those granted, must, within eight days of tbe receipt of a notification from the Department of public works, present to the

*These are extracts from the new Mining Law of Mexico, relating especialty to the taxation, etc. To he issued by the California State Mining Bureau. Translated freely by W. S. Keyes, M. E., vice-president of the Bureau; Member Am. Inst. M. E., California Academy of Sciences, etc.; original Spanish document furnished by A. K. Coney, Consul-General of Mexico.

Treasury Department a declaration of acceptance thereof and the latter Department shall issue the authorization (resguardo) described in the preceding section.

ANNUAL IMPOSTS.

SEC. 17. The annnal imposts described io Sec. 4 of the law shall be collected by the Bureaus of Stamp Revenue conformably to the laws of March 31, 1887, December 9, 1891, and of others in force.

Payment must be made in Interial Revenue Stamps which shall have prioted thereon diagonally a device, contaloing the words "Mioeral Impost."

SEC. 18. The Chiefs of the Stamp Revenue Bureaus shall receive, as their only honorarium (fees), two per cent of the gross product of the sale of stamps, forming the anoual tax on the mines.

SEC. 19. The Chiefs of the Stamp Reveoue Bureaus shall maintain a record of the mines situated within their respective jurisdictions, made up from data furnished them by the Treasury Department.

SEC. 20. Owners or holders of mines shall make payments at the head or subordinate Office of the Revenue, as may be proper. But the Treasury Department may modify this regulation in the cases deemed equitable and just, after notifying the Heads of Bureaus, in order that they may advise the Chief Revenue Official in whose jurisdiction the mioe is situated.

SEC. 21. The Chiefs of the Stamp Revenue Bureaus shall see to it that the Subordinate Bureau or Agency shall, at suitable periods, forwaid an account of the stamps sold for each mine, attached to pages which expressly set forth for what mines the stamps were sold and whether the amount meets the requirements of the title papers, as indicated by the duplica'e copies thereof, furnished in compliance with Sectioos 8 aod 12. As soon as the Chiefs of Bureaus have received the said sheets, they must communicate the same to the Treasury Department, to which must be forwarded, at the end of each fiscal year, documeots composed of said sbeets, which relate to the respective mine or mioes.

SEC. 22. Each one of the three payments, described in Section 5 of the law, must be made before the 31st of July, the 30th of November and the 31st of March of each aod every year. To effect this, each principal or subordinate Revenue Office must furnish each interested party a notice which shall contain the following, viz.:

I. The words "Mineral Impost" at the top thereof.

II. The name of the State and municipality to which the office of issuance belongs.

III. The name of the mine and number of claims to be taxed; the municipal subdivision where it is situated; the name of the owner, company or adventurer in possession of the same and the number boroe by the title papers in the record.

IV. The amount of each one-third to be paid.

V. Three columns, left blank for the affixing of the stamps, due for each one-third, which must be duly canceled. The parties in interest must be careful so to place the notice, referred to in this section, in tbe office, as to be easily visible, together with the stamps, which prove the payment.

SEC. 23. As soon as each third shall, according to a preceding sectioo, have become delinquent, and as soon as the Head Office of the Stamp Revenue Bureau shall have received official notice of such failure of payment, advice thereof shall be giveo to the Agent of the Department (Fomento), in order that publication thereof may be made during one month upon the Bulletin Board referred to in Section 21 of the Regulations of June 25, 1892, which shall render effectual, for the creditors of the mine, the notification contained in Section 25 of the law of the 4th of the present month.

The creditors are not permitted to make payment of the impost until after the affixing of notice thereof upon the Bulletin Board by tbe Agency of Public Works (Fomento).

SEC. 24. In case there be no agency of the Department of Public Works within the jurisdiction of the head office of the Stamp Bureau, empowered to give the notification meotioned in the preceding article, the latter shall give notice to the creditors of the mines through the local district court, after having learned from the *Commercial Record* the names of such creditors.

SEC. 25. After the termination of tbe time limit, mentioned at the end of Section 6 of the law, without the payment of the tax, the Heads of the Stamp Revenue Bureau sball at once give notice thereof to the Treasury Department, in order that the latter may declare the forfeiture of the property, and that the Department of Public Works (Fomento) may dispose of the mine. This declaratioo must be published in tbe *Official Gazette*.

SEC. 26. The notice referred to in Section 7 of the law shall be given in writing, by the interested party, to the Head Office of the Stamp Revenue Bureau, through the hands of the suboróinate or respective agency. The Chief Officer shall advise the Treasury Department io order tbat record tbereof be made.

SEC. 27. The notices referred to in Section 8 of the law must be given in the same terms as provided in the preceding section. The Head Office sball communicate the same to the Treasury Department in order that the same may be recorded, and the proper publication thereof be made in the *Official Gazette* and form the final fiscal settlement thereof, which must he made known to the appropriate Head Bureau, in order that a proper return may be made to the applicant.

SEC. 28. The grantees of mineral zones, referred to in Sections 14 to 16 of tbis law, must, within the first ten days of tbe fiscal year, make application to the Treasury Department, in order that the latter, in view of tbe documents (expedientes) to whicb the said sections refer, may issue to them the authorization (resguardo) whicb exempts them, during tbe fiscal year, from the payment of the mineral impost.

SEC. 30. For the preseot year only, the payment of the one-third, due in July next, shall not be exacted in that month, but the parties in interest may make the same on any day of the months of August, September or October, or they may make payment in full before the 30th of November of the two-thirds due at that date.

Mexico, Juoe 30, 1892.

The Intelligence of a Horse.

Can a horse reason, or does he act solely from instinct? Many believe that he has reason and intelligeoce; others attribute all his acts to instinct. As a help to elucidate this question, I wish to present the readers of *Science* the following statement of facts based oo long and close observation:

I have a horse, now 19 years old, that I have owned 13 years. I have used him all this time, almost every day, harnessed to a buggy, in going back and forth to my office. He is very gentle, good-natured and kind, and has never shown any vices. Soon after I commenced using him I noticed that on Sundays, wheoever I drove him down town, he strongly insisted, by pulling on the lines, on going to the church where I had been in the habit of attending. I watched this disposition constantly after that, and on every Sunday since, when driven out, he has continued to do the same thing, and, if left to his own will, invariably goes to the church and stops. I thought it possible that he was guided by the ringing of the church bells, and tested him by driving him down town at all hours of the day, before and after the ringing of the bells, but the result was the same. He invariably insisted on going to church on that day, no matter how often I drove him down town. My office is one block west and one north of the church, and a half-mile west of my residence. In going to church, I usually turo south one block east of the office, but I sometimes go around by the office, where I usually drive him every morning and afternoon. In going to my office, he never offers to go to the church except on Sunday, but on that day he invariably begins to turn south to the street leadiog to the church, from fifty to a hundred feet before reaching the crossing, and, if not checked, turns into the street and hurries to the church. He has kept this up for at least 12 years. He never does this on any other day than Sunday. In bad weather or good weatber it is the same, although at the office much of the time he has had stable protection from bad weather. On week days be often insists on going to the stable in bad weather, but on Sunday, even when I compel him to go by the way of the stable, he pulls over to the opposite side of the street and hurries on to the church, if permitted, though he may have to stand out in the cold, rain or snow.

Sometimes, from one cause or another, he has not been taken away from home from one to four weeks, and I supposed he would lose the run of time, or at least show some hesitation and uncertaioty; but not so. On the first Sunday after I drove him out, he insisted, as before, on going to church. He never offers to go there any other day of the week, though the churcb bells are rung and numerous services are held nearly every day.

If on Sunday I go to the postoffice, which is on the northwest corner of the street-crossing, where we usually turn south to the church, instead of going from there direct to the office as on other days, he turns to the soutb and goes to the churcb. He never willingly goes to the postoffice on Suoday, but always stops there on week days of his own accord, if permitted. Many times I have taken other streets on Sunday and approached the church from other directions, but in all cases, when left free, he invariably takes the first street leading to the church. I have experimented with him very largely in this respect, with a view to learning how he keeps the run of time, but am unable to satisfactorily account for it. I have also observed and experimented with him in a great many other ways, and have taught him to know the meaning of many words.

When alarmed at aoything, he looks back to me with a frightened look, as much as to say: "Will it harm me." On my saying, "All right, go on," he moves on. If much frightened, he will repeatedly look back for assurance from me.

He knows the meaning of many words, such as office, postoffice, schoolhouse, mill, farm, cemetery, church, apple, corn, grass, water, and many others. The fact tbat he knows the meaning of these words, or at least attaches a meaning to tbem, I have tested many times in many ways, the relation of which would make tbis paper too long. When his corn is about used up, if I speak of it to him aod say, "Deck, your corn is out; you must go to the mill," even before starting from home, he turns in at tbe mill as I go by, and goes up to the office door wbere I have been in the habit of ordering bis food. Sometimes I have forgotten it by the time I come opposite the mill, and would have gone by, but he has not forgotten it and turns in. If I say to him, "Do you want an apple?" of which he is very fond, he puts on the most wistful look and does all in his power to say that he does; and if the apple is not produced at once, he begins to explore my pockets and clothing with his nose in search of an apple suspected to be concealed about my person. If I say to him, "Do you want grass?" he at once shows that he expects to be turned out upon pasture.

He also knows a number of people by name, and where they reside, and if told to stop at the residence of one of them, naming bim, he will do so, without any guiding.

Tbese are only a few of the many evidences of his intelligence. Hundreds of examples might be given showing bis knowledge and intelligence, and that he gives very close attention to and understands what is said to him.

Do not these facts strongly indicate that the horse has more than mere instinct, that he reasons; tbat out of the storebouse of his knowledge and experience he forms conclusions, thoughts, purposes and plans. He understands certain symbols, such as words; he keeps the run of time, and knows uniformly when Sunday comes, for be has not made a mistake in this respect for more than 12 years past; he uses many and diverse means for makiog his wants koown.

Iostinct is supposed to imply inherited knowledge of objects and relations in respect to which it is exercised, and will usually, if not always, operate where there is no experience to guide. But this horse's knowledge, in these respects, has not been inherited, but is acquired. He never was at this church till he was six years old. His mother was probably never there. In instinct there is no necessary knowledge of meaos and ends implied, though such knowledge may be present, but instinct is always manifested in like manner by all individuals of the same species, under like circumstances, which is certainly not true io this case.

Hence I infer that this horse does reason; that he has a high degree of intelligence, even much more than he is able to make us understand and appreciate.

But does the fact of his observing Sunday imply a moral sense? Why does he seek to go to the church on that day? It has been said that animals do reasonable things without having the gift of reason; that they do things involving distant foresight without having any knowledge of the future; that they work for that which is to be without seeing or feeling anything beyond what is; that they enjoy but do not understand; that reason works upon and througb them, but is not in them. The facts that I have related and observed make me greatly doubt many of these statements. I find it hard to sharply define the limits between instinct and reason. The facts that I have related indicate reason, intelligence, motives, and the formulation of plans, methods and schemes for carrying out preconceived purposes. Some of the acts, at least, indicate pure reason based upon former and remembered sensations, perceptions and knowledge, and the purpose to gratify merely mental desires.

What motive does this horse have for going to church every Sunday, even at a sacrifice sometimes? It is not for rest, it is not shelter, it is not feed, it is not company, it is not to gratify any merely physical want, for all these things he has elsewhere every day. Is it not purely an intellectual or moral want that he seeks to gratify? He stands near the church door, bears much of the exercises, especially the singing, and will remain, almost without motion, whether tied or not, till the services are over and I am ready to go home. But it cannot be for the mere speaking and sioging that he hears there, for he often hears speaking, singing, coocerts, the Salvation Army, and music of various kinds while he stands tied at the office on the public square; but none of these take the place of his church-going.

These facts I have given as tending to illustrate and explain animal intelligence. I have given only such as I have verified many times.—T. B. Reddiog in Science.

Bitumen in France.

Certain districts in Auvergne, France, are very rich in deposits of bitumen. There are three varieties equally abundant, the liquid, bituminous limestone, and the bituminous sandstone. The mineral is met with at a few feet from the surface. The seams of bituminous limestone are in some places 200 feet thick. The mines have never been worked beyond 80 or 100 feet. The mineral gives oil and gas by distillation, but as experiments have been made only on the bitumen near the surface, of course it gave but small quantities of light oil. The bitumen extracted by boring deeper contains more volatile oil. At a deptb of from 500 to 600 feet inflammable gas comes up through the bore. The only use to which the mineral is turned, at present, is for the manufacture of paving-blocks. The bituminous limestone is used for this purpose; it is crushed into powder, a small quantity of liquid bitumen and sand added, and then the mixture is put into molds and submitted to very high hydraulic pressure, and the blocks thus turned out are in the form of bricks or tiles, as required. They resist perfectly well the action of heat; the trials made in different towns where they have been employed for paviog the streets have turned out most satisfactory. The work is very neat, and it costs less than the ordinary paving-stones. The boring in search of petroleum cootinues very slowly, on account of the pressure of the gas which drives up the sand and soil into the tubes to a height of 100 meters and prevents the working of the bores. It is tbought they lack the proper machinery for the purpose, also the necessary experience in such work. There can now be no doubt about oil existing at a certain deptb; it comes up already on the surface of the water. There is an opportunity for experienced capital to test these deposits of bitumen, which, it is believed, would yield good returns for the investment.

AT the annual meeting of the stockholders of the Grand Prize Mining Company, 75,080 shares were represented, and the following officers elected for the ensuing year: William C. Ralston, president; Thomas Cole, vice-president; William Bowers, H. Zadig and H. H. Noble, directors. R. R. Grayson was reelected secretary and his financial statement showed an overdraft of $3231.50.

THE Eagle Lake, Land and Irrigation Company has purchased all of Hutchinson & Leavitt's irrigation system. This combination affords water for immediate supply, and makes one of the largest irrigation systems in the State. Great progress in the development of Honey Lake valley is now expected.

AT a special meeting of tbe directors of the Savage mining Company it was resolved to ask the directors of the Norcross Mining Company to hold a joint meeting with them for the purpose of trying to arrive at some conclusion relating to operating both mines through one shaft.

Mechanical Progress.

Antifriction Bearings.

The subject of antifriction bearings is attracting considerable attention in England as well as here, and a paper on the subject was recently read by Mr Killingworth Hedges before the mechanical section of the British Association, which is thus reported by *Engineering:*

Mr Killingworth Hedges next read a paper on "Antifriction Materials for Bearings Used Without Lubricants." After referring to former inventions and practice in this field, the author went on to describe experiments he had made, which led to the introduction of a material which he referred to as carboid. This was composed of finely-powdered carbon mixed with steatite, the mixture having the advantages of plumbago as regards lubricating properties, but showing little signs of wear after tests extending to two years' constant use. Prof. Unwin's experiments with the material show that the coefficient of friction is independent of the area of contact, and only increases if the temperature becomes excessive, but not with increased pressure. It tends to diminish with increased speed. The first cost of a dry bearing is less than with brass or patent metal. Besides the economy secured by the absence of lubricants, there is a saving in wages required for oiling and cleaning. The other objections incident to lubrication are, naturally avoided. Up to the present the chief use of carboid has been for steam-heated rolls. It has also been used experimentally with success for light-rolling stock generally.

In the discussion Prof. Forbes said that some time ago a Philadelphia company gave up using plumbago alone as a material for bearings and adopted "fiber graphite." As a *tour de force*, a steam engine was constructed in America, in which all rubbing surfaces were fiber graphite, there being no oiled-bearing. There had also been spindles running for months at 10,000 revolutions a minute. He had also seen a file working in a graphite bearing as smoothly as if it had been a turned journal. The graphite filled up the cuts in the file and rendered it smooth. He thought that the heating of the bearing described would be considerable, because it was a bad-conducting substance. The Philadelphia company found that the fiber graphite would not work if subject to heavy pressure.

Mr. Jeremiah Head pointed out that the bearing, which had been handed round at the meeting, soiled the fingers if rubbed lightly. This showed that the material would wear away, and it would be interesting to know to what extent this was consistent with the claims made by the author. It was well known that if extreme hardness and smoothness could both be insured, a bearing would run without lubrication.

Mr. Hedges in reply said that the longest period his bearing had run was two years, and the wear had been very small. In a pulley-bearing on a rope tramway, the wear after three months was only one-thirty-second of an inch. This, the engineer to the line had said, was a remarkably good result, especially as the pulley was situated on the summit of a hill, where the duty was very trying.

Prof. Unwin said that he had had one of these bearings under test and subject to a considerable range of conditions, some of them very severe. He had crammed the pressure on until the journal had been heated up to purple, but it did not seem to injure the bearing. He did oot think that a solid bearing, without lubricant, could be run with so low a coefficient of friction as one with lubricant, but the advantages of doing away with the necessity of oiled-bearings were so great that one could well afford some loss of power.

THE PNEUMATIC-TIRED SULKY.—The *American Machinist* says: Machinery men who have devoted their attention to the production of bicycles have, it seems, taught horsemen and builders of trotting sulkies something about wheels and tires, the new pneumatic-tired trotting sulky, which, by the way, is the production of our friend, Stirling Elliott, of Newton, Mass., having demonstrated its ability to enable the trotting horse to lower the record by several seconds. The reasons for this seem to be that the steel-tired sulky cuts into the surface of the track to some extent at least, and the substance of which the track is composed not being elastic, the force expended in compressing it at the point of contact in front of a vertical line drawn from the axle is not returned to the wheel at the rear of this line, while with the pneumatic tire the area of contact is, by the flattening of the tire, very much enlarged; the track is not scored, and the force expended in compressing the air in front of the vertical line spoken of is returned by its expansion at the rear portion of the area of contact. Solid rubber is commonly considered to be an example of almost perfect elasticity, but where the element of time enters, and it is necessary that the reaction in order to be of service should take place instantly, air is much better, as the pneumatic tires demonstrate. Ball bearings are also used on these sulkies, by which the axle friction is reduced to an almost infinitesimal quantity.

An American Automatic Tinning Machine.

Mr. J. B. Myers, who is connected with a firm of tinplate manufacturers, of Philadelphia, in a recent interview, said: "We have in use an automatic tinning machine, of American manufacture, which enables us to turn out roofing-plate 50 per cent. superior in quality to any ever manufactured in England or Wales. Our iron is manufactured by the Apollo Iron Co. This iron, which is in sheets, is fed into the machine. It is carried into a box containing two rotary brushes, which scour off all the scales and other impurities on both sides. The sheet next passes into a spraying-box, where all adbering particles are washed off. It is then thoroughly dried by passing through a set of rolls. The oext set of feed-rolls carry the plate to the edger, a device for edging the separate sheets, and passing them on together in a continuous strip. After the continuous sheet passes through the flux-pot, it runs into the tinning-pot. Rising out of the pot, the sheet passes through palm oil. It is then carried upstairs by the machine, cut into strips of any desirable length, and stored in rolls. The tin-coating is well and evenly applied and the joint between the sheets is thoroughly soldered. Although the machine is now used in making terne-plate, it can be used equally well on bright plates, either in continuous strips or separate sheets. The average capacity of the machine is equivalent to 100 boxes of 20x28 sheets per day of ten hours. It enables us to turn out a better quality of tin than is made in Europe. Under the plan used in Europe, the iron plates are first pickled in acid in order to remove the impurities. The machine obviates this. Then again the plates are more evenly tinned here. In Europe the plates are dipped and the coat is uneven, being much heavier at the bottom than at the top. Experts say that under the plan in vogue in England and Wales, it is impossible to put more than 40 pounds of tin in a box of plates 20x28 inches. Under our process we can put in any amount of tin, up to 100 pounds, if necessary."

Plumbing Practice.

Great care is taken by many plumbers in the adjustment of plumbing apparatus in that the work shall look symmetrical and mechanical in finish. This is proper and desirable, and should be insisted upon, says the *Operative Builder*. It is often the case, however, that an excellent piece of work in appearance is not as complete in utility as it might have been had a little more pains been taken with a feature of the work often neglected. Why it is that a plumber will run a certain supply pipe to a point of delivery and then throttle it by a flat waterway bibbcock and a flat waterway stopcock is to some minds inconceivable. If it be intended, then there is no further use of writing about it. Still it would be quite as reasonable to have the cross-section of the diameter of the pipe equal in area to the area of the stopcock or bibbcock, and the additional cost of the increased size of the pipe could then be avoided. This condition of things is frequently found in plumbing practice; it does not interfere so seriously in the matter of the size of the discharge faucet, the excuse being, the larger the pipe the greater the velocity than in a small pipe. Yet, losing sight of the fact that if such be the case, why not continue the same "to the end" of the faucet and get the benefit of the velocity entire? The serious part, however, in the plan is the stopcock controlling the supply to the delivery pipe and discharge cock. Very few plumbers consider what detriment is effected in using a flat waterway stopcock supposed to equal in cross-section of area the cross-section of the area of the delivery pipe with which it is connected. A few minutes' consideration will convince the most obtuse plumber that the ½-inch and ⅝-inch stopcock with a flat waterway in but few instances possesses the area in cross-section equal to ½-inch or ⅝-inch pipe, circular in form. Even if it did, it will be found that diverting a circular stream to a rectangular stream through the waterway of a stopcock and back again to a circular stream is at the expense of the energy of the velocity of the current of water occasioned by the diversion.

It is but trifling to maintain the relations necessary to reduce friction in moving water through service pipes. To break the current generated by velocity is the thing to avoid, and if it is recognized in plumbing service, a good step in progressive plumbing will be inaugurated.

Therefore, if you would obtain the best results from circular discharge pipes, be they lead, iron or brass, see to it that stopcocks are round waterway, and also the same regarding bibbcocks. It will be found upon close examination of the merits of this feature of plumbing that a great saving will be effected in the matter of frictional resistances, which absorb so much of the energy of the flow of water through distributing pipes in the dwelling and warehouse.

Scientific Progress.

Self-Developing Plates.

It has been suggested that photographic sensitive films might be so associated with transparent soluble films containing developing material as that, while the primary action of the image-forming light would be absolutely unaffected, simple immersion of the exposed plate in a dish of pure water, or other solvent, would suffice to set up chemical interaction between the materials constituting the associated films, and would result in the development of the image. Thus, for instance, the sensitive surface of an ordinary plate might receive a preliminary coating of a gum or other transparent and soluble varnish. Over this might be laid a clear, soluble film, containing matter capable of effecting development. When dried, this film of developer might be itself gummed over, and then coated with a further soluble layer, containing such other chemical constituents as it might be desirable to have present, but, pending the occasion for development, sufficiently isolated to avoid the possibility of chemical reactions. It is unnecessary to enumerate the different media, as collodion, soluble silicate, etc., that have been considered by the inventor as supporting and isolating layers for the suspension of the developing agent in the manner described. Several cases in which, probably, the idea could be successfully carried out, will at once suggest themselves to the reader. But it would be another thing to say that the conveniency of such plates, having combined layers of sensitive and developing salts, would not be more than counterbalanced by the obvious disadvantages. Needless to add, the device could equally well be applied to the combination of toning or fixing salts with chloride and other printing papers. It would be a simple matter to apply the supplementary chemical layer at the back of the paper or glass support; and, in the case of transparent supports, it might, if suitably pigmented, be regarded as, at the same time, a backing preventive of halation. In short, we quote the suggestion as an interesting photographic curiosity.—Optician.

LOW TENSION STREET ARC LIGHTING.—The growing popularity of low tension multiple arc lighting must have impressed every one who has watched the tendencies of electric lighting. When we see local incandescent companies and electric railway companies running hundreds and hundreds of such lights on their regular circuits, it is plain that a new and important factor in street lighting must be taken into account. As a matter of fact, a great many of these constant potential arc lamps are used on the streets, but it is still a novel thing that they should be used from end to end of an important thoroughfare. This departure has been taken, however, in the contract made last week by the New York City Gas Commission with the local Edison Company, for the lighting of Fifth avenue from Washington Square all the way to Fifty-ninth street. The lights will be in pairs at street intersections, and, of course, will be supplied from the Edison underground mains without the necessity of any overhead wires. A brilliant illumination of this fine avenue is expected in place of the feeble flicker of the old gas lamps, and the experiment will be very closely watched. The influence of its success upon the lighting of leading thoroughfares in large cities must be obvious to all.—Electrical Engineer.

THE MOON AND THE BAROMETER.—The influence of the moon on the barometer is dealt with by Mr. Bornstein in a recent article in the *Meteorologische Zeitschrift*. He refers to the question as to whether there exists any relation between the pressure of the atmosphere and the altitude of the moon. This study is based upon observations made at four different stations in Germany and Austria and does not take into account the phases of the moon, or her distance from the earth, but considers merely the lunar day. The results obtained are: First, that the variations of pressure do not indicate any atmospheric tides, and second, that at three of the stations the pressure shows but one oscillation during the lunar day. At Berlin and at Hamburg the maximum takes place a little before the moon sets, and at Vienna, at the moment of least culmination, whereas the minimum takes place, at all the stations, at the moment of the moon's rising.

An Automatic Telephone Exchange.

A very ingenious piece of apparatus, intended as a substitute for the telephone girl, is described in the *Electrical World*. It is not a new type of telephone, but merely an adjunct to the ordinary Bell transmitter and receiver by which any subscriber can place himself in connection with any other subscriber with whom he wishes to converse merely by the operation of a set of simple keys placed upon the telephone box at the subscriber's end of the line. It is not an easy matter to tell just how extended an application apparatus of this kind may find, but there are doubtless many places in which its application to existing telephone plants would prove economical. This is especially true of such places as large factories where the heads of different departments, who must communicate frequently with each other, are located in detached buildings, and also in small towns where the number of subscribers does not exceed a few hundred. Although there is nothing in the construction of the instrument itself to prevent its application to exchanges having several thousand subscribers, the multiplicity of contacts in such cases would doubtless be considered an objection to its use, although this could probably be satisfactorily arranged. Another point which might be raised against it would be the difficulty or complication made necessary in arranging to connect with the various lines of long-distance telephone service. It is of interest in this connection to notice that according to the statistics of the telephone industry, recently published by Mr. Allen R. Foote, for the decade preceding 1890, that the average number of telephone subscribers per exchange in the United States was 183, while the average number of employes per exchange was seven, or, in other words, the average number of subscribers per employe was 26. The average daily calls per subscriber are shown by the same statistics to vary from 48 in exchanges of 100 or less subscribers to 89 in exchanges of 1500 subscribers or over. Taking seven as an average in all the exchanges, this would indicate that one employe is necessary for every 175 calls per day. The Strowger apparatus will doubtless find a wide application in many places where the present high telephone tariffs have prevented the introduction of any telephone system, since we may look for the establishment of exchanges within the next two years in towns that average a very much smaller population than even the smallest towns where telephone exchanges are now in use.

A POLARIZATION EXPERIMENT.—At a recent meeting of the Physical Society of Berlin, Herr Arons described the following experiment on electrolytic polarization. If we divide an electrolytic vessel with platinum electrodes and acidulated water solution by a partition of some precious metal, such as gold, silver or platinum, a diminution of current is usually observed, and the metallic partition will be hydrogen polarized on one surface and oxygen polarized on the other. Herr Arons experimented with a view to seeing whether he could obtain a thin enough partition for the two polarizations to annul one another. He employed for this purpose an electrolytic vessel 22 cms. long by 5 broad and 8 high, divided in the middle by a sheet of glass pierced by a hole 1.5 cm. in diameter. When the sheet of glass with an unobstructed opening was replaced by one which had the opening covered by a piece of platinum foil 0.1 mm. thick, the deflection of the galvanometer was diminished, and there was a violent ebullition of gas. Gold and silver leaf partitions caused no disturbance. By altering the resistance out of the galvanometer circuit, its deflection was in each experiment brought back to its original value. The following figures give the resistance which it was found necessary to take out of circuit in each case: Solid platinum plates, 19 ohms.; platinum plate pierced with a hole 3 mm. in diameter, 5 ohms.; silver and gold (leaf), 0 ohm.; four layers of gold leaf superposed 0.25 ohm.

TRADE MARK.

(MACARTHUR-FORREST PROCESS)

DENVER WORKS: On the D. & R. G. R. R. near the Broadway Electric R. R. Depot.

Also in Australia, South Africa, New Zealand, Queensland, Etc.

The Cassel Gold Extraction Co., Limited, Scotland.

GLASGOW WORKS:

General Office of Company:

Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: Denver; The Livingstone Gold Mining Co., Boulder Co., Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co., Cal; The Shasta Gold Ex Co., Middle Creek, Shasta Co., Cal.; The Mercur Gold Mining Co., Fairfield, Utah; The Pacific Gold and Silver Extraction Co., Gro Grande, San Bernardino Co., Cal.; The Ora Bella Mining Co., Yavapai Co., Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co., Revenue via Norris, Mont; and others in course of erection.

The object of this company is to introduce the MacArthur-Forrest process.

We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.

If you desire an experimental test communicate with the secretary.

If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons in Denver.

We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.

The process consists of pulverizing the ores to a fineness of about 50-mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tubs especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.

The total cost, as as rule, does do exceed from $2.50 to $5.00 per ton.

The most desirable class of ores for this process are the so-called refractory gold, ores pyrites, hematites, manganese and tellurium. We have also treated successfully dry silver ores.

We will be pleased to answer any inquiries and furnish any desired information. Address,

T. L. WISWALL,

P. O. Box 926. Gen. Mgr and Secretary.

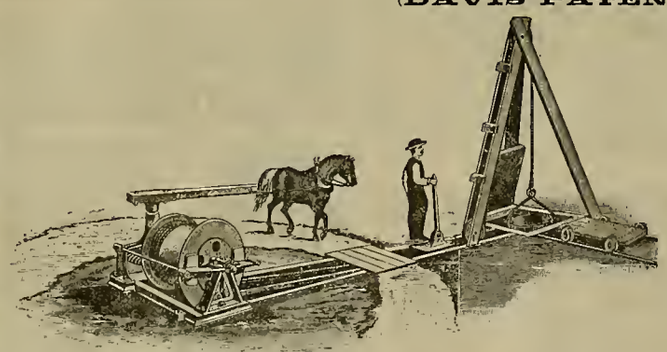
BUILDERS OF

"Sensible" Horse-Power Hoisting Whims.

(DAVIS PATENT.)



PRICES REDUCED.

The "Sensible" Hoist is the cheapest and beyond doubt the best in the market. It is built entirely of iron and steel, mounted on a heavy iron base plate, and is therefore very durable and not affected by exposure to climatic influences.

The bevel gear on the drum shaft is loose, and, in hoisting, drives the drum through a friction clutch. This avoids the frequent accidents occurring with other Whims, occasioned by the breaking of the gear teeth when throwing them out of gear. In lowering, the drum is pressed by a powerful screw lever against brake woods at the opposite end. Perfect means of adjustment are provided for the friction clutch and brake blocks.

As the drum is entirely independent from the driving gears the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases the capacity of the machine by avoiding the loss of time due to stopping and starting the horse.

It is very light and compact and very easily taken to pieces for transportation by mules. The cost of erection is very small, two men in half a day being able to put it in place ready for work.

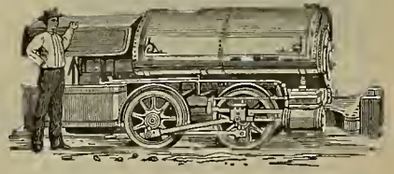
Weight of hoist, 1200 lbs. Total shipping weight, including sweep, levers and sheaves, 1400 lbs.

Circulars giving Capacities and Prices furnished on application.

BALDWIN LOCOMOTIVE WORKS.

ANNUAL CAPACITY 1000. ESTABLISHED 1831.

LOCOMOTIVE ENGINES!



Adapted to every variety of service, and built accurately to standard gauge and templates. Like parts of different engines of same class perfectly interchangeable.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies the information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, San Francisco.

RUPTURE, PILES and all Rectal Diseases POSITIVELY CURED, in from 30 to 60 days, WITHOUT OPERATION OR OBSTENTION FROM BUSINESS. Also ALL NERVOUS, SKIN, BLOOD PRIVATE AND CHRONIC DISEASES OF BOTH SEXES. STRICTURE AND URINARY TROUBLES CURED No charge unless cure is effected Consultation free. Call or address for pamphlet, DRS. PORTERFIELD & LOSEY, 833 Market Stree San Francisco, Cal.

Electricity.

Testing Dynamos.

Electric business generally is done in a most unbusinesslike way. A purchaser orders of a manufacturer a dynamo of a desired capacity; the purchaser gets the machine into position, puts the belt on, turns the switch and off she goes—that is, if she goes at all. If the dynamo does not start off immediately and bring all the lamps and everything else in the circuit up to the expected point of excellence, or if, for some simple cause, the dynamo doesn't "generate," it is at once condemned. The cause of the trouble may be an open circuit, or it may be the connections are not made correctly.

There are a great number of reasons why a dynamo will not always start up at once, and all of these reasons should be looked into before judgment is passed. I have seen engineers spend weeks to find the "pound" in their engine, and they did not "dam" the man that made the engine because it pounded. An engineer knows that there is a reason for it, and sets to work systematically to find the cause. But let a dynamo get out of order, and this same man will lose his head at once. I once went 150 miles to put a brush down on the commutator of a dynamo. An engineer of a certain plant in a large establishment in a sister city had been running a 1200 light incandescent light for more than a year. Finally, when he started up one night, one of his dynamos would not "generate." He had "looked everywhere for the trouble," and gave it up. I was sent for, and in a few moments, by a little systematic testing, discovered that the upper brushes did not touch the commutator by a small fraction of an inch. The stem on which the brushes were mounted had become slightly loose and had turned back enough to lift the brushes from contact with the commutator. The brush-holders were of the kind having a limiting stop each way. The remedy was, of course, very simple. The trouble could have easily been found by the engineer had he used a little "horse sense," and, as I have before said, a little systematic testing. I do not mean by this a series of guesses, but tests based upon sound judgment. Go off in a corner and think it out, but do not hop around and try a dozen different things without knowing the reason why you are doing them. It is seldom that trouble of this kind is cured accidentally.

I went to Milwaukee one time to find the trouble with a large Brush arc machine. The dynamo man said he had not been able to find the trouble, and that it had not worked for three days. It seems incredible when I relate the cause to have been that one section of the commutator had been removed and was missing. How the man in charge could have failed to discover it is more than I can understand, but he was ignorant of the fact until I pointed it out. If I thought that it would make interesting reading, I could relate, I venture, at least one hundred as ridiculous cases as these, where a little thinking and a general knowledge of the machines in charge could have saved time and money to the owners. I will not attempt in this article to describe how these tests should be made in order to locate trouble, for there are hardly any two cases alike. It will therefore be necessary to adopt a systematic method, which I will endeavor to present at another time. There are two sides to every story, and the engineer and dynamo men are not always to blame. The owners of plants should not look to them for all the trouble that occurs until they have first performed all they should before the plant is given into their hands.

Every plant that is put in should be tested, "received" and accepted by an independent and competent electrical engineer, one who is in business for himself and expects to remain so, so that he could give a fearless and honest opinion to his employer. He should closely examine the dynamo for capacity, insulation, continuous run, efficiency, and an important and often overlooked quality, mechanical construction; and then come in a number of minor features which should be looked after, inductive velocity of the armature—it may be greater on a drum than a ring armature; rise of temperature on a full load should receive close attention; hysteresis and Foucault currents are much more noticeable in badly constructed and proportioned machines than is usually suspected. I have known a case where these two ever present evils have absorbed more than 10 cer cent of the power for the dynamo. The heating of switch contacts and other joints should be noted, the resistance of the circuit as a whole, and in sections, should be measured. In fact, every condition should be carefully noted. If the dynamos are compounded, see that the rise with load corresponds with the loss in line, also be careful to note if there is more than one compound dynamo, whether the equalizer is large enough. The resistance of the equalizer should not be less than one-half of the resistance of the larger armature.

There are numberless points of this kind that should be carefully inspected by a competent man before a plant should be accepted, and I believe that if owners understood more of the importance of these seemingly little points—but, in fact, very important factors to the success and economical maintenance of every plant—that there would not be so many butchers in the business of manufacturing electric-light apparatus to-day.—Foree Bain in Electrical Industries.

Conduit Roads.

Although it will probably be difficult to find a more economical system of electric railroading than the overhead trolley, yet there are many cases in which objections are made to the poles and overhead wires necessitated by this system. In such places, as shown in the cities of New York and Chicago, cable roads are rapidly replacing horse lines, and are therefore encroaching on a field which might have been claimed by electrical traction if there had been a few conduit or storage battery roads in successful operation in this country, which overcome these objections to poles and wires. The unquestionable success of the overhead trolley roads and the lower cost of construction and operation seem to have checked the development of otber systems. This is greatly to be regretted. There is a field for both. The overhead trolley will doubtless obtain the lion's share of the business, but there are plenty of street railways in large cities where the overhead wires are not allowed, and where some other system must be used. If there is no electrical system which is better than the cable, this part of the railway business will be monopolized by the latter. The recent introduction of miles of cable road in New York and Chicago has already shown this. There are two electric conduit roads at present running regularly, a long one in Buda-Pesth and a short one in Chicago, both pronounced by impartial parties to he a success. With these two as a beginning, something ought to be accomplished in the field, and it is not unlikely that the first introduction on a large scale will be made in Chicago. It is rumored that the success of the latter road was one of the reasons why the overhead trolley ordinances in Philadelphia were vetoed by the mayor. The parties who asked for overhead privileges in that city, it is said, tried to have President Yerkes pronounce the Chicago conduit system a failure, but he refused to do so, and, on the contrary, stated that it gives perfect satisfaction, on hearing which the mayor vetoed the Philadelphia ordinance. It is to be regretted that the influence of capitalists should he made use of in this way to attempt to undo that which engineers have finally accomplished after years of hard and patient work, in cvercoming not only engineering difficulties but also deep-seated prejudices.—Electrical World.

A PROPOSED UNDERGROUND ELECTRIC RAILWAY FOR BERLIN.—In a German contemporary, Mr. Holle describes a scheme for an electric railway in Berlin similar in many respects to the City & South London line. The proposed plans were made by the Allegemeine Elektricitats Gesellschaft of that city. It is proposed to run the trains at three-minute intervals a little over half a mile apart; there are to be 48 trains each with its own locomotive, and 144 carriages, running at one time. Two power stations will be erected, each one having two separate, complete plants; the connections of the generating stations with the different parts of the line are to be made as flexible as possible, that is to say, to provide power all along the line in the event of a breakdown in the machinery for any one section. Five hundred volts will he used; the motors will be slow speed, with gearing running in oil. The length of the line is given as about 30 miles and is to cost about $10,000,000. The fare is to be 2½ cents for any distance. It is estimated that the traffic will he about five persons per car mile.

THE Havemeyer building, which is claimed to he the handsomest office building now heing erected in New York city, is going to he equipped electrically in the most perfect manner. It will have an installation of over 3000 incandescent lamps. The wiring will be done in interior conduit throughout, and the generating plant will be of the most modern type, the dynamos heing directly coupled upon the shaft of the engine.

Electrical Cars in City Streets.

There is always a certain proportion of the people in every community who find it next to impossible to look at anything whatever from any new standpoint. Roads and streets have been for a long time built and maintained for the use of those who traveled by the aid of horses, and from this circumstance there are very many well-meaning people who cannot bring themselves to think that any otber use of them should be allowed, especially if such use is at all liable to "scare" a fractious or uncontrollahle horse, and no matter how many people may desire to travel upon them by other means.

Comparatively few people living in cities can afford to maintain their own carriages and horses. If they travel about at all it must be on foot or hy some comparatively cbeap method of locomotion—maybe an electric car or a bicycle. But it seems that too many carriage owners imagine that no such use of streets should be allowed, though it is, of course, in the direct line of the employment of labor-saving machinery and of the greatest good to the greatest number.

A line of electric cars was recently started in Plainfield, N. J., in the face of very determined and, for years, successful opposition of carriage-owners. One of the cars recently frightened a horse and caused a runaway, with a result, as stated, that a "test suit for damages is to he instituted." Such a suit would probably be based upon the assumption that no use of a street is legitimate that may frighten a horse, no matter if such use accommodates a hundred times as many people as are able to ride in carriages.

The bicyclists have had to fight this notlon from the first, and have finally, by means of a powerful organization, established by numerous court decisions their right to the use of the highways upon the same terms as people who travel in wagons and carriages, and that drivers of horses are themselves responsible when they drive animals that cannot be controlled.

It seems altogether probable that the use of machinery of one kind and another for moving about on streets and highways will increase rather than diminish, and that the idiosyncrasies of the horse, or his individual preferences for flying pieces of paper, umbrellas and barking dogs as objects of alarm, will not be allowed to permanently obstruct this progress.—American Machinist.

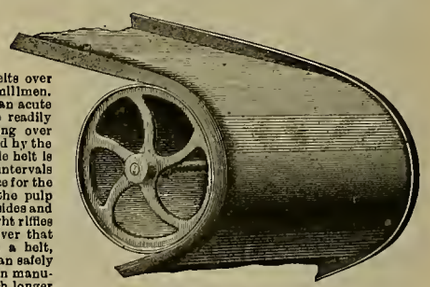
THE BLASDEL CONCENTRATING BELT COMPANY.


We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.
First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphuret
H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Useful Information.

A New Miner's Electric Lamp.

The desirability of superseding in collieries the ordinary miner's safety oil lamp by an electric lamp, which becomes extinguished the instant the light is exposed to the naked air, says *Iron*, has led to numerous endeavours to adapt electricity to this purpose. Secondary or storage batteries have been for the most part employed, although attempts have been made to press primary batteries into the service. The latest attempt in this connection is that of Colonel Engledue, late R. E., of Byfleet, Surrey, who appears to have eliminated from his lamp all the objections to which previous lamps of this nature have for the most part been open. These are—excessive first cost and heavy cost of maintenance as compared with oil lamps; inability to burn the necessary number of hours; great weight, and the necessity for skilled labour to adjust them. The Engledue battery is of very simple construction, consisting of a wooden case 6½ inches by 5 inches by 3 inches, having a partition forming two cells. These cells are lined with lead, to which are attached four carbon plates in each, thus bringing the carbon and lead into electrical circuit. The top of the battery is hermetically sealed by an indiarubber washer, over which an ebonite cover is tightly screwed into the wooden case. Two ebonite plugs are screwed into and through the ebonite cover, each of which holds a cylindrical zinc element, all being made tight by rubber washers to prevent leakage when the battery is reversed. Contacts with a glow lamp are made in the usual manner, the lamp being protected by a small lantern with a reflector. The battery is charged to within about an inch of its top with Colonel Engledue's electrolytic fluid, and after working for four hours, when a proportion of the zinc and also the strength of fluid is somewhat exhausted, the battery is reversed. The increased area of the hitherto-untouched zinc is thus attacked by the somewhat weakened solution, and the electro-motive force of the battery is sufficiently sustained for a further period of six hours, making a total of ten hours' working. In order that the battery shall swing properly when its center of gravity has been altered by reversal, a simple and effective handle is used. The lamp has been tested in practice, and is found to give a useful light for from 10 to 12 hours, and to be otherwise efficient and suited for its purpose. It weighs about five pounds, and its first cost is put at 15s., the cost of maintenance being put at 6d. per week, which is about the same as the ordinary miner's lamp. Altogether the new lamp appears to embody the elements of success.

JAPANESE METALWORKERS.—The Japanese are pastmasters in the treatment of alloys, both in texture and color, and no better guides exist. They achieve their grandest results by the simplest means, a judicious blending of various metals, inlaying and pickling. Copper is the basis of their chief alloys, and by incorporating with it certain proportions of gold and silver they obtain remarkable results in color through the pickling process. Not only do they get striking effects from their alloys and pickling, but their mode of working up the metals is a thing to be studied. For instance, they will take six or seven plates of different metals and alloys, weld them together, and then by drilling, punching-up and filling, get a surface in which all the metals show in a manner that is truly wonderful. By the range of tints at their command they can work out on a metal surface scenes of life and landscapes with effect never dreamed of by metalworkers in the Western world. Among some examples recently shown in England was a knifehandle on which was a representation of a duck dipping its head under water of a stream in which it was swimming, the arrangement of the different alloys by which it was composed and the pickling being so well-arranged that the neck of the duck was seen as under the water when the handle was held in a certain light. Another example was a swordhilt on which some minnows, not more than one-sixteenth of an inch in length, and each having a pair of golden eyes, were swimming up a stream, the effect of their being below the surface of the water being suggested with marvelous skill.

FINISHING REDWOOD.—In order to properly educate the Easterner in the proper way to finish redwood the following method—which is a satisfactory one—is published. It gives a hardness and lasting polish. It is as follows: For the first application use one part of boiled linseed oil to five parts of benzine or turpentine. This gives a rich dark color without staining, and by exposure to the sunlight a varied color is obtained, the softer part or end wood turning dark, the other remaining light. The wood should then be treated with two or more coats of shellac and well sandpapered; then apply varnish or hard oil as required, after which, if well rubbed with pumicestone, a highly polished surface is obtained. Where a light, cheerful finish is required use only white shellac for filler, and shellac, hard oil or varnish for outside coat, hard oil being preferable, as it gives a greater protection to the wood.—West Coast Lumberman.

INDUSTRIAL PROGRESS IN THE SOUTH.—Since 1881 the corn crop of the South has increased 75 per cent, as against 71 per cent in the rest of the country; the cotton crop has increased from five and a half million to nine million bales—an increase in value, even with the present low price, of $200,000,000; in 1891 there were nearly 45,000 miles of railroad in the South, against less than 24,000 in 1881—a gain of 87 per cent, as against a gain of 56 per cent in the rest of the country. The passenger traffic of the same roads increased during the same period 360 per cent, as against an increase in the rest of the country of only 168 per cent. In pig-iron manufacture the South's output jumped from 451,000 tons in 1881 to 1,914,000 in 1891—a gain of 323 per cent, as against a gain for the rest of the country of 78 per cent; in other words, in 1881 the North and West made more than nine times as much iron as the South; in 1891 they made less than four times as much. The increase in the number of milloperators in the South was 135 per cent, as against an increase in New England of 17 per cent. And so in every line of productive activity the marvelous rapidity of increase is explained, showing that in assessed valuations the property of the South has in this period very nearly doubled, and increased from $187 per capita to $271—a record that is probably without a parallel in the whole history of substantial industrial growth. And in spite of the temporary depression caused by an overproduction of cotton, the increase goes on.—Forum.

TRUE SURFACE PLATES.—When a set of surface plates is true, if their surface is thoroughly cleaned with a silk handkerchief or the palm of the hand, and one is applied to the other, it appears to float about as if on numerous frictionless rollers, the slightest touch being sufficient to move it. If one plate be slid on the other, applying sufficient pressure, they will be found to adhere together, the top one being able to hold up the bottom one with ease. This was at one time thought to be owing to atmospheric pressure, the plates being so true as to exclude the atmosphere. This, however, does not seem to be the case, for in a lecture before the Royal Institution, Dr. Tyndall describes some experiments he made with some hexagonal Whiteworth plates, in a vacuum, and they showed both the property of adhesion and floating. The lower plate of the two weighed three pounds, and had attached to it a mass of lead weighing ten pounds, but still the plates adhered together. Dr. Tyndall supposes the adhesion to be caused by the molecular attraction of the numerous bearing points brought into contact through the truth of the surface of the plates.—The Mechanical World, London.

DEEP COAL MINING IN EUROPE.—The upper seams of coal in the continent of Europe are being gradually worked out and it is found necessary already in many quarters to commence work at greater depths. The upper seams are mostly thin, but lower down the deposits are much thicker, so that the difficulties attending excavation at such great depths will be in some degree compensated. In the Mons district in Belgium some shafts have already been sunk to the depth of 3775 feet. Though the coal is excellent the hinderances to mining are tremendous. There are many formidable blows of gas, and water at 122° Fahr., enters the cuttings in great volumes. Some very powerful pumps are being put down in order to keep the workings clear of water. It has been found necessary to replace the ordinary wooden timbering with steel props.

COLOR blind and fire blind are not at all synonymous terms nor are the conditions similar. Color blindness is generally permanent; fire blindness only temporary. A person gazing intently at an open fire for some time may become fire blind for the time being, and thus be unable to judge of the degree of heat that is being taken on a piece of metal.—Sparks from the Crescent Anvil.

Sugar in Mortar.

Some time ago a statement that the mixture of a small quantity of sugar with mortar greatly improved the latter, exercised the risible faculty of the building fraternity. The notion was regarded as too ridiculous for serious consideration. There is, however, reason to believe that the addition of saccharine matter to mortar is an extremely valuable discovery. In the first place it enables bricklaying to be carried on in frosty weather.

About two pounds of coarse, brown sugar to a bushel of lime and two bushels of good sand, will supply the proportions for a mortar that will resist frost admirably. It is claimed, however, that in addition to this advantage, mortar with sugar mixed in it is vastly superior to mortar without it. It sets as hard as cement very soon, makes the brickwork extremely strong and quite effective when used with dry bricks. For indoor plastering also, saccharated mortar sets hard quickly. When portions of the same wall had been covered in one part with sugared and in another with unsugared mortar, the latter has ripped up directly when a nail was run over it. Months afterward, the other had become as hard as stone. Much interest is taken in the matter by Mr. Crampton, of Cranleigh, Baltimore, and he reports some interesting experiments. He points out that if sugar be added to mortar that is already made it will render it too thin. Strong, sugared water dissolves lime in the same way that water dissolves sugar. It is, therefore, necessary to dissolve the sugar in water first, and then add the sugared water to the lime slowly and cautiously. The mortar should be as stiff as it can be used. For lime-washing, one pound of sugar to 16 gallons of water will make it adhere splendidly. Drops of whitewash made with water so mixed, if they fall on the floor or wiodow, or any iron plate, cannot be washed off. They stick like enamel, and have to be scraped off. Evidently sugar is not such an absurd thing to mix with lime as the practical man thought.—Operative Builder.

AIR OF MINES.—A simple and effective method of examining mines, in respect to their prevalent atmosphere, has for some time past been employed at Kotschied, near Aachen, Germany, and is likely, from its results, to be extensively resorted to. A gasholder is placed in the chief ventilating shaft, and is so arranged that it becomes filled in 12 hours, in this way it being possible to obtain a fair average sample of the mine air. The air thus collected is examined by means of a grisometer, any free carbonic acid that may be present is absorbed by caustic soda, and its percentage estimated by noting the diminution in bulk. The marsh gas is then decomposed by a platinum wire heated to incandescence by means of an electric current. A further diminution in bulk takes place under this arrangement, and, the degree being noted, the percentage of marsh gas in the pit air can be calculated, and the necessary precautions be observed accordingly.

WANTED IMMEDIATELY.

Mechanical draughtsman, with experience in Mining, Milling, Smelting and Concentrating Plants. Also, Metallurgical Engineer with mechanical knowledge and shop practice to take charge as Assistant Engineer; also Steam Engineer thoroughly posted in all cases of Corliss Engine designs, pumps and hoisting plants, to take charge as assistant.

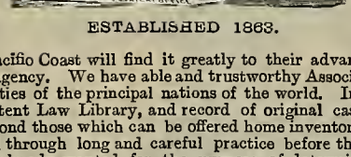
Scientific Press



Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

TUSTIN'S PULVERIZER.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

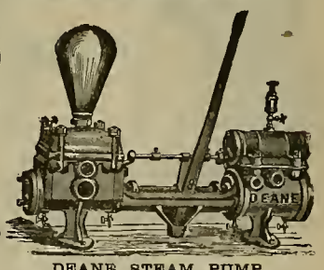
MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels

Tustin's Pulverizer
WORKS ORE WET OR DRY.

ENGINES AND BOILERS
OF ALL KINDS,
Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.
Boiler Repairs Promptly attended to and at very moderate rates.
AGENTS FOR THE PACIFIC COAST FOR THE
Deane Steam Pump.
SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers.

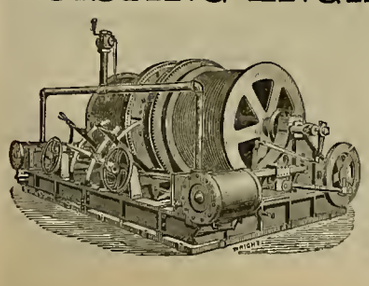


DEANE STEAM PUMP.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

SEND FOR PRICE LIST.
The Judson Dynamite and Powder Co.,
— MANUFACTURERS OF —
Dynamite and Blasting Powder,
18 CALIFORNIA STREET, SAN FRANCISCO.

Directors:
ROBERT JUDSON, ALVINZA HAYWARD, THOMAS BELL, JOHN S. DOE, ED. G. LUKENS (President.

HOISTING ENGINES FOR MINES



1, 2, or 4 Drums, with Reversible Link Motion or Pat. Improved Friction.
MADE ONLY BY THE
LIDGERWOOD M'F'G COMPANY,
5 & 7 N. First St., Portland, Oregon.
96 Liberty St., New York.
84 and 86 West Monroe St., Chicago.
197 to 203 Congress St., Boston.

IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD
In Quartz, Gravel and Placer Mining.

PRICES GREATLY REDUCED. ONLY REFINED SILVER AND BEST COPPER USED. OVER 3000 ORDERS FILLED. FIFTEEN MEDALS AWARDED. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated. These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Streets, San Francisco.

SAN FRANCISCO GOLD, SILVER AND NICKEL PLATING WORKS,

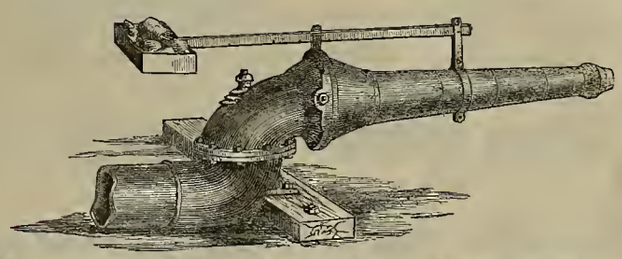
E. G. DENNISTON, Proprietor. 663 & 665 MISSION ST., SAN FRANCISCO, CAL.

Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper. SEND FOR CIRCULAR.

MECHANICS' INSTITUTE SAN FRANCISCO

RECEIVED EVERY MEDAL Awarded on the Pacific Coast for Silver-Plated Amalgam Plates and Best Gold, Silver and Nickel Plating.

IMPROVED FORM OF HYDRAULIC GIANTS.

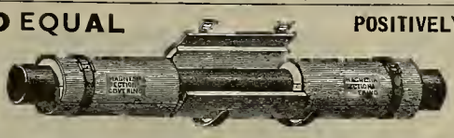


THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

IT HAS NO EQUAL POSITIVELY FIRE-PROOF.

Can Be Put On By Any One.



Adopted by the Navy.

MAGNESIA SECTIONAL COVERING

FOR BOILERS, STEAM PIPES, COLD STORAGE, and all places requiring Non-Heat-Conducting Material.

THE GIANT POWDER COMPANY.

— PATENT OWNERS OF —

NOBEL'S DYNAMITE, NOBEL'S EXPLOSIVE GELATINE, NOBEL'S GELATINE-DYNAMITE, AND THE JUDSON IMPROVED POWDER.

Best and Strongest Explosives in the World.

JUDSON POWDER.

The only Reliable and Efficient Powder for **Stump and Bank Blasting.** Railroad Contractors and Farmer use no other. **As others IMITATE our Giant Powder, so do they Judson, by manufacturing an inferior article.**

BLACK POWDER.

The Giant Powder Co. having built Black Powder Works, with all the latest improvements, at Clipper Gap, Placer County, known as **THE CLIPPER MILLS,** offer this powder and guarantee it the best.

CAPS and FUSE at Lowest Rates.

THE GIANT POWDER COMPANY, 30 California St., San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

CLINTON.—*Record*, Sept. 23: Word comes from Wieland that at the Clinton mine the scarcity of water in the ditch has rendered it necessary to reduce the working force temporarily.

A BIG YIELD.—The Kennedy mine yielded $180,000 last year. Amador county gold mines are hard to beat.

NEARLY READY TO START.—The Hector 40-stamp mill will start up next week. Everything around the mine is being put in fine shape and when the mill is once started it is expected that it will run steadily.

AROUND PLYMOUTH.—A crushing of ore is being hauled from the Bay State mine to the Pacific mill at Plymouth. A fine body of ore has been encountered in the Wheeler mine, near the same place, and teams are now busily engaged in hauling the quartz to the Cosmopolitan mill for a test run.

WILDMAN.—Amador *Ledger*, Sept. 24: Last week a break happened to the main pipe at the Wildman mine on Broad street, bringing the machinery to a standstill. The underground men were all in the mine at the time of the accident, including Superintendent Tregloan. As it would take about a day to repair the break, all decided to climb out by the ladder way, rather than remain below. In a short time from the decision all were on the surface, Mr. Tregloan with the balance. The break is repaired in a good, substantial manner, and everything is running smoothly again.

Butte.

THE WHEELER MINE.—Oroville *Register*, Sept. 22: Wm. Wheelar of Wyman's ravine has unbounded faith in the famous blue lead that is attracting so much attention about Bangor, and is confident from the prospecting done years ago that this same lead stretches from Bangor clear to this town. He says that shafts have been sunk at various places, and that the same character of gravel has been found in a dozen spots. He determined last spring to demonstrate that the channel could be found and set to work sinking a shaft on his land. The work was abandoned for a time, for he was obliged to give his attention to the mine he owns at Brown's Hill, but he has lately been sinking, and is now down about 85 feet. Good gravel has been struck, and the bed is about four feet thick. The gold is coarse and heavy, but the gravel prospects well. He has let a contract for putting up two arrastres that will be run by an overshot wheel, which he will have built at once. The water will be obtained from the Palermo ditch, and as soon as the arrastres are completed, he will put a large force of men at work getting out gravel. He is confident that he has a bonanza, and his friends all hope his predictions may prove to be true.

MINING NOTES.—A Downieville company has been organized to open a mine between Bangor and Wyandotte. The shaft on the Banner mine is now down over 400 feet. It is a 6x10 shaft with a double compartment. It will be sunk to the 500-foot level before any crosscuts are run to strike the lode. The formation which has heretofore been dipping toward the mountain has now turned toward the river, and experienced miners believe this is a good indication. From the Hay & Clark mine at Bangor there has been taken up to last Saturday $6000 in gold-dust, while the total expenses have been about $5000, leaving $1000 net profit. The channel where this company is working is 400 feet wide and the gravel is 17 feet thick. The new quartzmill at Forbestown, erected by the owners of the Stow mine, is nearly ready for operations.

Calaveras.

ANOTHER MINING ENTERPRISE.—Mokelumne Hill *Chronicle*, Sept. 24: Mr. W. H. Curnow, of this place, and his brother-in-law, J. K. Dennis, of San Francisco, have started in on a new mining venture this week. They have commenced to sink a shaft on the channel that runs from what is known as the "Old Lone Star Diggings," in Happy valley, to Old Woman's gulch. The Lone Star claim, which was worked some 30 years ago, is situated at the head of the channel, and is said to have been exceedingly rich. Mr. Curnow intends to sink on the channel some 600 feet below the old Lone Star claim, using a horsepower whim to prospect with, and if developments should prove satisfactory, the necessary machinery will at once be erected to work the channel on an extensive scale. Mr. Curnow is of the opinion that it will take a shaft over 100 feet in depth to "bottom" the channel.

BONDED.—The Harrison and Victor mines on Esperanza creek, owned by Zumwalt and Vandell, have been bonded to E. H. Davison of this place for one year for $2000. The Herold Mining Company, a San Francisco corporation, have purchased the five-stamp mill on the Cleveland mine at Sandy Bar, and are now moving it to their mine on the Mokelumne river, near Big Bar. The mill will be running in about two weeks. A force of men is now at work on the Foote & Thompson mine at Rich gulch. The gravel mines located on John Williams' ranch in Old Woman's gulch have been bonded to Oakland parties. Work will be commenced at once.

Kern.

STRIKE OF RICH GOLD ORE.—Bakersfield *Californian*, Sept. 24: In 1858, A. J. Maltby, who for many years has lived at Woody, opened a gold mine lying in the ridge between White river and Rag gulch in Kern county, and from it extracted a great deal of gold. When water was struck, the ground was stoped above and then work ceased. Mr. Maltby, however, always felt confident that there was an abundance of rich rock still deeper down in the vein, and recently, with other parties, started a shaft and tunnel to tap the mine below the old workings. The pay chute is found to be about 60 feet long with a vein from 5 to 21 inches wide and at present carrying a seam of rich ore about 5 inches thick that will mill over $300 a ton in gold. Mr. Maltby has brought samples of the quartz here and left them at J. S. Drury's, where they may be seen for a few days. The quartz is lively and carries seams of oxide of iron which are literally full of gold. The specimens are very handsome, and withal are of good size. The ground from the tunnel to the old works has been stoped out, the last run of 38 tons yielding 221 ounces of gold bullion valued at $2762, or over $73 per ton. In this run there was no assorting, all of the quartz that was mined being sent to mill. In the bottom of the tunnel the ledge continues as good as above, the rich seam especially well holding its own. There seems to be no reason why this mine should not yield a handsome profit.

Mariposa.

RENEWED INTEREST.—Mariposa *Gazette*, Sept. 24: We are pleased to be able to state with authority that considerable interest is being shown just now in mines in Mariposa county in the Sherlocks and Whitlocks region, especially, more hopeful signs are being developed this fall than has existed there for years. The Helm brothers have been working faithfully for several winters on a claim on Whitlocks. It has been slow work, for it takes money to develop mines, but they had a good prospect and they have followed it until they are down 100 feet, and a cleanup of 12 tons of rock a few days ago gave such satisfactory results that they are sure of big pay as long as they continue on that vein. The San Rafael and Ellingham mines have lately been bonded by new men and active steps are being taken toward enlarged forces in both mines, and should the outlook justify it, the stamps of a big mill will before long awaken echoes on the Colorado hills. The Ward brothers have increased the working force on the Whitlock mine and are preparing for a steady season's work. They have already enough good-paying rock in sight to insure the success of a mill. Besides these mines, the usual number of prospectors are looking around selecting desirable locations before the coming winter. In the neighborhood of Bear valley several mines are being worked quietly but successfully. The prayers of all residents of the county will steadily ascend for a continuation of the same blessing.

Nevada.

THE OAK TREE MINE.—Grass Valley *Tidings*, Sept. 23: This morning steam was again turned on at the Oak Tree mine adjoining the Peabody. Since the last crushing, a few weeks ago, the mine has been lying idle, while arrangements were being made to prosecute more vigorous development work. This mine has been in operation but a little over a year, but from present indications it is certainly an unusually promising property. The first crushing of ore from the ledge, which is ten inches in thickness, yielded $1240 for 19 loads. The second crushing, containing the same amount of quartz, yielded $871.25. The shaft is but 100 feet in depth, but sinking will be resumed and no stoping will be done until the shaft is sunk 100 feet deeper. But six men will be employed until the 200-foot level is run, when a large force of men will no doubt be employed.

MERRIMAC MINE.—Grass Valley *Telegraph*, Sept. 24: Everything is going on in a satisfactory way at the Merrimac mine. Chas. Stocks, the superintendent, informs us that the shaft is now 530 feet in depth and the ledge looks well. The ledge in the bottom is about 15 inches in thickness. The company contemplates starting a station at the depth of 500 feet, and will then drift east and west. The company has now about 100 tons of ore on the dump. The mine is situated on the western slope of the Town Talk ridge, and is in the Grass Valley zone of quartz ledges. The formation is in slate. The company is negotiating for electric power, and in the meantime the shaft is being constantly lowered. The ground is easy, the miners making about 60 feet a month.

HERMOSA MINE.—Grass Valley *Telegraph*, Sept. 26: Saturday afternoon quite a good-looking ledge was found in the south drift at the 100 level in the Hermosa mine. Just what size the ledge is will be determined in about one week. The owners of the mine feel quite jubilant over the new find.

Plumas.

GREEN MOUNTAIN.—National *Bulletin*, Sept. 24: From W. N. Goodwin, who was at the Green Mountain mine last Saturday, we learn that a good-sized body of rich ore has been developed in the face of No. 6 tunnel—good $15 rock. The mine generally is looking well, the timbering and other improvements being of a substantial character.

Siskiyou.

QUARTZ AND OAVEL.—Yreka *Journal*. Sept. 28: The work of developing the old Clark & Co. ledge on Humbug creek, recently purchased by a San Francisco company, still continues to yield rich-looking quartz, with the vein widening as the shaft is extended deeper on the ledge. The company will be ready to crush in a few days, as the old Warren mill, taken some time ago from Yreka Flats, is almost ready for starting up again at this claim, under the supervision of Mr. Hunt. At the Spencer, Boyle and other mines on the same creek, a large quantity of quartz has been lately taken out, with new finds in the way of extensions, to keep the mills in constant operation, while a great amount of placer-mining is carried on with good success, to make Humbug one of the most prosperous mining camps in Siskiyou. The Golden Gate Co., now running a tunnel into the Humbug mountain directly west of Yreka, continues operations steadily, reaching a distance of 180 feet, with the water supply gradually increasing. No gold-paying quartz or gravel has yet been found, of much value, nor do they anticipate any for some distance yet. The Lee, Lash & Co. blue gravel claim at Greenhorn creek, south of Yreka, near the stage-road, is to be reopened soon, now that the bedrock water has diminished to such an extent that the steam pump can handle it easier in the way of pumping to keep the bedrock clear for drifting. The Spencer Mining & Milling Co. of Portland mining men, working a two-foot ledge on Booker creek in the Bailey Hill section, just this side of the Oregon line, realized about 14 ounces of gold in a couple of hours crushing last week with a two-stamp mill. The mill consists of machinery worked like a Burleigh drill, with a lot of pipe and no boiler, by means of which the stamps are operated—an invention of Mr. Spencer, the principal owner of the mine.

Shasta.

THE OLD BANGHART.—Redding *Free Press*, Sept. 24: It has been some years since Mr. Banghart left Whiskytown with a snug little fortune taken from the Banghart mine. The mine was sold to a San Francisco company and the company sold it to other parties; in fact, it changed hands several times, finally becoming the property of Dr. George Grotefend, who sold a half interest to James Eligh. The mine is a peculiar one, there apparently being no regular ledge, but a series of ledges crossing and recrossing each other. Four thousand feet of tunnels have been run, and sometimes for several months dead work must be done before any gold appears, when suddenly cross-ledges are discovered and more or less gold is extracted. Grotefeud & Eligh performed dead work for a month, when they encountered decomposed quartz and gold. Five hundred dollars a day has been the average yield for a week past, and it it is thought that $10,000 will have been extracted before the pay chute runs out. Grotefund has every confidence in the mine, but says it is one of that kind of properties that cannot be sold for its real value.

NOTES.—The cyanide process is a big success at the Shasta mill. E. P. Connor says that his mine still continues rich and that the walls of his shaft are well defined. Vandeveer was down from Flat creek Thursday. He is getting out ore, but will not crush until fall rains furnish water. Several miners in the vicinity of Shasta are working their mines and doing well by selling their ore to the Shasta Gold Extraction Company. The Calumet Company expect to have their ore cable ready for operation within the next 30 days. This cable, when completed, will have a working capacity of 50 tons a day. Gus Dannenbrink passed through here on his way to Weaver and reported everything flourishing on Knownothing. He thinks the new process of working base ores a success. The Calumet Company are actively at work opening their mines on Flat creek. They are also pushing down their shaft at the Calumet mine with the view of being able soon to furnish their cyanide works with an abundance of ore. The Lower Springs mining district was one of the richest in placers during pioneer days, and thousands of dollars were washed out of the soil. These placers were fed from quartz veins, and thousands will be yet extracted from pockets and seams. For pocket hunters it is a fruitful field.

Sierra.

WORKMAN QUIT WORK.—*Mt. Messenger*, Sept. 24: Last Saturday evening, the workmen employed by the Bald Mountain Extension Company quit work. The trouble was in regard to wages, as we understand the situation. The company has heretofore been paying $3 a day and charging 80 cents a day for board and lodging. Recently the management decided to hereafter pay its workmen $50 a month and board them. To those who had families, and who went home Saturday night and stayed over Sunday, a rebate of $2 a month was made. This has been customary since the works were opened at the new tunnel. The men were not satisfied with these wages, and, not being able to make any other terms with the company, they quit work. We are informed that orders have been given to pay off the men and close the works. Only a few men are now at the mine. No work will be done in the drifts for the present, and probably not until next spring. The two tunnels that were being run will be let by contract. It is to be regretted that any disagreement should exist between the company and the men, as it can but be a detriment to both parties.

Sonoma.

CINNABAR.—Sonoma *Tribune*, Sept. 22: After several months' prospecting at the Crystal mine in the Pina Flat cinnabar belt, a development was made last Saturday that infuse more interest and encouragement in the owners. A rich body of ore was struck and its depth is immeasurable. The company proposes putting up a furnace and smelter in a few months and then operations with increased forces will commence in earnest.

Yuba.

MOONEY FLAT AND SMARTSVILLE NOTES. Wheatland *Four Corners*, Sept. 24: While the wave of depression has fallen with a heavy hand upon some of our sister mountain towns occupying higher latitudes, owing to their inability to work the mines by hydraulic process, the people of Mooney Flat are showing a spirit of healthy activity, push and business enterprise along the line of drift mining, not to be surpassed by any other town of its size in the State. The Smartsville mine, managed by John Doubt, cleaned up last week from 180 cars, $400. There are 16 men employed at present. We are not, at the present time, taking out any great amount of money, owing to the tearing down, removing, putting up the mill, sinking shafts and running gangways. This, of course, has entailed quite an expense upon a company of ten, who are all workingmen, and who have no great amount of reserve capital to draw upon. This work has occupied about three months, and will probably consume another month before the arrastres will be running up to their full capacity. It is estimated that the entire expense will be somewhere in the neighborhood of $5.00, providing the channel containing pay dirt is reached by the Ayer Company within the period stated, and the prospect looks very flattering. If the opinion of mining men is worth anything, there is certainly a very rich and extensive mine in this locality.

NEVADA.

Washoe District.

CONS. CAL. & VIRGINIA.—*Chronicle*, Sept. 24: 1750 level—Have continued to extract some milling ore in working upward from the sill floor to east crosscuts Nos. 1, 3 and 5 from the main south drift, and from the point where the upraise from the end of the drift run south from the end of the crosscut run west from the end of the main southwest drift connects with the 9th floor openings. The upraise started in the crosscut run east from the end of the south drift last mentioned has been carried up 14 feet; total length 37 feet; in ore of milling value. Have continued making repairs to the southwest drift. 1800 level—Along the south end of the drift running south from the crosscut run east from the winze No. 1 sunk from the 1750 level, we have continued to extract some ore from the sill floor upward of milling value. In stoping upward from the drift run south from the crosscut run east from the bottom of winze No. 2, down 45 feet, have extracted some milling ore. There has been extracted from all parts of the mine during the week 992 1200-2000 tons of ore, which was shipped to the Morgan mill, the average value of which, per car samples, was $26.78 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $24.01 per ton per battery samples. Bullion shipped to Carson Mint, assay value, $15,927.87.

OPHIR.—1465 level: From the south drift, 101 feet below the sill floor of the 1465 level, from the Mexican into the Ophir ground, the west crosscut No. 2 has been advanced 16 feet; total length, 101 feet; in porphyry and clay carrying a little quartz of nominal value.

MEXICAN.—On the 1465 level, the west crosscut, which was started from the drift run north from the crosscut run west from the bottom of the winze sunk 101 feet below the sill floor of this level near the south boundary of the mine, has been advanced 11 feet; total length, 93 feet, continuing in porphyry and clay.

UNION CON.—900 level: The joint Union Con. and Sierra Nevada west drift has been extended during the week 18 feet; total length west from the joint shaft, 2457 feet. The face is in porphyry.

UTAH.—The north drift from west crosscut No. 2 has been extended 19 feet; total length 38 feet. This drift is passing through a porphyry, quartz and clay formation.

SIERRA NEVADA.—The work of enlarging and lowering tha Cedar Hill drift has been continued up to the vein on which we have drifted six feet, from which some pay ore has been saved; face shows 3½ feet of quartz assaying from $17 to $20 per ton. We have broken ground for an intermediate tunnel midway between the Kenosha tunnel and the Cedar Hill drift.

ANNEX.—East crosscut north on 420 level was advanced during the week 20 feet; formation clay and porphyry.

GOULD & CURRY.—We are doing considerable repairing on the 200 and 300 levels. On the Sutro tunnel level, the joint north drift with Savage Company had been advanced 26 feet through hard porphyry; total length, 566 feet.

BEST & BELCHER.—At a point in north drift, 143 feet from east crosscut, started east crosscut No. 2 and extended same 14 feet through porphyry and stringers of quartz.

HALE & NORCROSS.—1800 level: During the week advanced the north drift 15 feet; total length, 210 feet; face in porphyry. The drain in this drift has been completed to the face. We have started two west crosscuts from the north drift.

CHOLLAR.—Are repairing north drifts on the 750 and 850 levels. The east crosscut, 160 feet south of north line, 930 level, is in 83 feet; face in soft porphyry.

POTOSI.—Repairs to drift connecting with Lindsey winze, 250 level, are completed. Are retimbering ground at top of the winze; also the south drift, 300 level. The raise from east crosscut, 1100 level, continues in low-grade ore. The raise from east crosscut, 1500 level, is up 20 feet; top in three feet of ore assaying $20. The south drift from the bottom of Potosi winze, 1850 level, is out 67 feet from footwall; face in quartz and porphyry. The northeast drift from the 1800 station, Ward shaft is out 870 feet; face in porphyry. Extracted and sent to mill the past week, 464 tons of ore from the 550, 930, 1100, 1150 and 1300 levels. Worked during the week, 465 tons. On hand at mill, 80 tons; average battery assay, $20.03; average car sample assays, $23.67. Shipped to the Carson Mint 420½ pounds of crude bullion.

WARD SHAFT.—The joint Alpha and Exchequer west crosscut, 1800 level, is out 68 feet; face in clay and porphyry. The joint Potosi and Bullion northwest drift, 1800 level, is out 870 feet; face is in porphyry.

IMPERIAL.—General repairs throughout the mine, especially on the 300-foot and sagebrush levels, are now going on.

BULLION.—The upraise from the east crosscut 320 feet south of north line, 1300 level, is up 75 feet. Have started a drift north from top of raise, which is out 12 feet; face in porphyry and streaks of quartz. The joint southeast drift from the bottom of Potosi winze, 1800 level, is out 67 feet from footwall.

EXCHEQUER.—The joint west crosscut on our north line of Exchequer, 1800 level of Ward shaft, is out 68 feet; face in clay and porphyry.

ALPHA.—The joint west crosscut on our north line of Exchequer, 1800 level of the Ward shaft, is ont 68 feet; the face in clay and porphyry.

CONFIDENCE-CHALLENGE. — The joint Confidence-Challenge northwest drift on snrface level is in 1091 feet from the Yellow Jacket shaft, or 233 feet from the north line of tbe Yellow Jacket; the face shows quartz of no value. Tbe joint Confidence-Challenge north drift, 100 level, is in 1236 feet from the Yellow Jacket shaft. The face shows quartz having no value. The joint Cballenge-Confidence east crosscut from tbe east drift on the same level is out 33 feet. The face shows quartz having no value. The joint Yellow Jacket and Challenge drift from north drift on the surface level is ont 45 feet. The face shows quartz having no value. No ore is being shipped from either Confidence or Challenge at present on account of scarcity of water in the Carson river.

OCCIDENTAL.—From the stopes on 350, 400 and 450 levels we have extrscted and milled 170 tons of ore of the assay value of $18 per ton as per battery samples.

YELLOW JACKET.—General prospecting is going on in different levels of the mine, but no ore is being shipped on account of scarcity of water in the river.

NEW YORK.—The north drift from No. 3 crosscut, 650 level, is out 63 feet; face in quartz of low grade. The south drift from the winze, 50 feet below the 650 level, is out 24 feet; face in ore of good grade.

SILVER HILL.—During the week have hoisted 364 cars of ore from the 390 snd 260 levels. Sent to the mill 202 940-2000 tons. Milled during the week 202 940 2000. Average car-sample assays, $24.56; average battery assays—gold, $15.31; silver, $7.77; total, $23.08.

Ploche District.

LACK OF WORK.—Pioche *Record*, Sept. 22: Quite a number of miners, for lack of work, have taken leases on several of our mines, and are taking ont considerable fair-grade ore. They have no difficulty in finding a ready market at the smelter. Most of the idle men in town have pulled out for Monkey Wrench, anticipating work. The camp has now all the men that can be employed until sucb tinie as the mines are more developed. It looks as if the smelter did not intend resuming operations for some time. Since the closing down everything has been put under lock and key, and a general air of quietude pervades the works.

Silver King District.

THE MINES.—Pioche *Record*, Sept. 22: In the Silver King district, 40 miles west of Pioche, in Lincoln county, msny good mines of silver, lead and free-milling ores are to be found. Not mnch doing, as the Wall street palsy—that is, the price of silver—forbids it. The prominent mines of this city are owned by Mr. Cupid, of Ely, Mr. Boskowitz of San Francisco, Wheatley Bros., of Pioche, and others.

Robinson Canyon District.

A FEW MEN WORKING.—Pioche *Record*, Sept. 22: Robinson Canyon, Wbite Pine county, is a much talked of camp. Tbe ores of tbis camp are principally gold. The Johannah and Chainman mines are the hope of the camp. They are working a few men, and are reducing the ore with an old-fashioned stamp-mill at Ely. So far as experts are concerned, it would have been a good thing for Robinson Canyon if tbey all had been hung in early days. These fakirs have done much to hurt the camp.

Cherry Creek District.

CLOSED DOWN.— Pioche *Record*, Sept. 22: Cherry Creek, 50 miles north of Ely, is a well-tried camp, but everything is closed down. With silver at a fair price, Cherry Creek camp wonld be equal to anything in the connty. The most famons mine in the camp—the Star—is the property of A. C. Cleveland of White Pine and a Mr. Haywood of California.

Tuscarora District.

NAVAJO.—*Times-Review*, Sept. 24: Work for the week has been confined to stopes above the 350-foot level, which continue to look abont the same.

BELLE ISLE. — North drift, 250-foot level, extended five feet; the face is still looking very well. Stopes near the upraise, same level, are now breaking into tbe ore.

NORTH BELLE ISLE.—North drift, south 300-foot level, extended five feet; the ore continues high grade. Have started a stope from No. 1 raise on the south 400 No. 3, which is showing some fine ore.

NEVADA QUEEN.—Second level — East line stope advanced 14 feet, total 156 feet, in vein formation giving low assays. North intermediate drift from No. 6 chute extended 22 feet, total 138 feet, exposing seam of good ore. Stopes east of No. 3 east crosscut have seams of good ore. Produced four tons first class ore assaying $260 per ton, and 48 tons of second class, assay $26 per ton.

COMMONWEALTH.—Second level — East drift from No. 3 chute advanced 23 feet, total 93 feet, in low grade vein matter. Third level—South drift from No. 1 chute in 75 feet, giving low assaye. West drift from same point is in 42 feet, also in low grade ore. Hoisted three tons first class ore, assay $230 per ton, and 40 cars second class, car sample $26 per ton.

Central District.

LONE STAR MINE.—*Silver State*, Sept. 24: Jack Pool and Charley Harvey are making preparations to start work on the Lone Star mine. This mine has been developed by a shaft to about 60 feet, and the ore body runs from top to bottom of the shaft, on an average of abont 20 inches thick, and assays $40 to the ton in gold, with a small percentage of silver. Messrs. Pool and Harvey have been working a lead mine in Antelope district until a few months ago, and on account of the low price of silver had to qnit work, as it takes very rich ilver ore to make it pay at 83 cents per ounce. The boys are good rustlers and we wish them every success in the Lone Star mine.

OREGON.

MILL MOVED.—Jacksonville *Times*, Sept. 23: Honck & Shaefer bave removed their quartz mill to Woodville, to work up the ore on the dump of the mine they recently purchased from W. J. Stanley, in connection with Robt. Taylor and R. Beswick of Ashland. The Judson quartz mill, which has been doing service in Slate creek precinct for some time past, was last week removed to Wolf creek, wbere it will be operated on some promising ledges under the management of Mr. Boyd, a first-class mining expert.

LUCKY BAR MINE —Grant's Pass *Courier*: This valuable placer is situated on Sucker creek, ten miles from Althouse postoffice, and is giving evidence of the foresigbt and perseverance of its owners, Messrs. Devore, Razee and Weidman. For the past five years tbis mine hss been worked at a continual expense, but recently rich pay dirt has been found in blue gravel which lies seven feet thick down near the bedrock, which hss not yet been reached except throurh prospecting shafts. Coarse gold is known to exist in paying quantities on the bedrock and drifting will proceed when that point is reached. Water-power is used to hoist the water and pay dirt to the boxes on the upper end of a 24-foot incline, and the same water which does the hoisting wsshes the debris from the gold. The famous Josephine county caves supply the stream which is being utilized by tbe owners of the mine. Wm. M. Richards, a mining man of experience and good judgment, has charge of the works, and tbe owners cannot help feeling gratified at the "sand" they have exhibited in bringing the investment to a paying basis. Other bars on Sucker creek will be worked by parties encouraged hy the result of development at Lucky Bar.

SOUTH DAKOTA.

STILL BUYING GEOUND.—Deadwood *Pioneer*, Sept. 24: Thos. H. White, on bebalf of tbe English syndicate of which he is general manager, took up, yesterday, the bond on the Beaver fraction, paying therefor $5000. The syndicate bas still a large number of claims bonded, and is taking them up as rapidly as the options mature. It has already expended over $300,000 in the purchase of ground, and before it hss secured all the property wanted will have paid out fully a half million dollars. Arrangements for the erection of a large reduction plant are not fully completed.

AN IMPORTANT FIND.—It has recently developed that tbe diamond drill, which has been in operation on the Florence Co.'s ground in Nevada gulch, up to within the last few days, bored through a stratum of excellent quartzite at a depth of 180 feet, and operations with tbe drill were at once discontinued. The owners merely wanted to prove the existence of the quartzite in the ground, and will soon commence sinking an operating shaft for ore. The discovery is probably tbe most valuable ever made in Bsld mountain. In Nevada gulch there exists a seemingly barren chsnnel covering a considerable ares, from whicb the quartzite appears to have been washed off, leaving the barren slates exposed. The appearance of this ground hss discouraged extensive prospecting, as, although its location wonld indicate it was on the helt, it was thought impossible for ore to exist there. The Florence management thought differently, and began prospecting with a diamond drill, with the result that the quartzite was found with shale on top of it, and an almost certainty of finding ore. Properties abutting on this company's ground, which have heretofore been coosidered almost valueless, bave acquired a new worth, and no doubt will be subjected to important exploration and development work.

Market Reports.

Local Markets.

SAN FRANCISCO, Sept. 29, 1892.

General trade was slow the past week. So far as the writer was able to learn no branch of trade showed any degree of activity. Why business is dull at this season of the year it is hard to say, for seldom is found two husiness men who agree on the subject. They admit that the retail trade is carrying small stocks, yet they do not show any great desire to anticipate their probahle requirements; even merchants at remote points, it is said, are not buying winter supplies with their usual freedom. The only reasonable solution for the present general stagnation in trade circles, and which is not confined to either this Coast or the United States, for it extends to all countries, is traceable to the cry of hard times which was raised fully three years sgo and which gained in prominence as the months passed. During times of general d pression every person lives more economical and it is this economy which has so telling an effect on the markets of the world. Besides this, the low price of silver has largely reduced the purchasing power of heavy consuming countries. With a large curtailed demand from this source, exporting countries are made to keenly feel the falling off. Commenting on this view of the situation, Cordley & Co., of New York, says:

Most all clouds have a silver lining, but at the same time it is rather rough to laugh at and gloat over a man who has to take his own medicine, hut it is certainly very interesting to watch the development of the silver situation in England. English newspapers and public speakers have for a long time crooked about the dire disaster coming to the United States from its over-is ue of silver-money, and have never had a thought that their chickens might come home to roost. They are, however, evidently waking up to the fact that a good deal of their own monetary disturbance is due to the present silver situation as affecting all of their colonial interests and trade, and that in order to save those interests and protect that trade they have got to fall into line with us and help to put silver on a different basis. The British Government evidently dislikes to recognize the situation, but it is being forced home to th m hy their mercantile and manufacturing constituency. While mercantile and financial disasters in England will be, of course, more or less reflected in this country, and hinder English investment in our stocks and bonds, if not inducing further sales of them, and thereby directly affecting our markets, ultimate good is certain to come from the present difficulties.

The local money market is reported unchanged. The activity in mining shares calls for more funds hut so far as we are able to learn the increased call ls readily met. The active mining share market has not, as yet, brought out the class of of outside buyers that it looks as if the inside are trying to get in their net, for the savings hanks do not report any withdrawal of funds by depositors, hut if the present activity in shares continues, it is thought that the depositors will he invcigled into the business when the savings hanks will lose large sums of money which, of course, will go into the pockets of the inside mining-share sharks. The Merchants report increasing remittances from the interior hut as a rule, interior merchants do not owe as much as they usually do at this season of the year. New York advices report that the cholera scare is wearing off and with fears being allayed, there is more disposition to invest money and operate in speculative securities. European mail advices do not report any material change in the general situation.

SILVER —In London the market price for silver hullion has held unchangeably steady, and in New York there has not heen any change since last Friday. The steadiness of the market is a source of surprise, and gives rise to considerab'e speculation regarding its future course. The general opinion is that the price will recede and may possibly go considerably lower than the lowest point touched in this year. This opinion, no doubt, is founded nn the fact that heretofore a steady market was followed by a break. Advices continue to come to hand reporting silver-producing mines shutting down owing to the product not meeting current expenses. Late advices from England confirm the reports that the home government has given the Australian colonies authority to mint silver. The particulars regarding the authorization we are not ahle to get at this writing. The exports hy sea the past week aggregate $118,150 in bullion to Japan.

MEXICAN DOLLARS—Exports the past week aggregate as follows: $143,660 to China and $244,000 to Japan. The market is fairly steady at 67 to 67¼ cts.

QUICK SILVER – Receipts the past week aggregate 356 flasks. The market appears to have a steadier tone.

BORAX—Receipts the past week aggregate 1061 centals, and exports 2410 centals to New York and 93,700 lbs of borates to Liverpool. The market is firmer, with a good Eastern demand reported.

LIME—Receipts the past week aggregate 3026 hbls. The market is slow at $1.25@1.50 per hbl.

ANTIMONY—The market is barely steady. Our quotations might possibly be reduced and still he an outside figure.

TIN—Imports the past week aggregate 6308 boxes plate. The market for pig is steady under moderate stocks and a fair demand for the season of the year. Tinplate is inactive, with the season for the consumption demand from canners passed. Eastern and English advices report slow and weak markets for pig.

PIG LEAD—The market has held barely steady. At the East the market is reported fairly active, hut under heavy supplies prices have shaded.

PIG IRON—The market is dull. To place large consignments, concessions are still in order. London cables report stocks greatly reduced, hut the depression in manufactured iron and steel is against the market. *Iron Age* reports the New York market as follows: "From practically every important distributing point of foundry and forge irons come reports of a firmer attitude of the market. This is due primarily to the attitude of the leading southern furnace companies, which have marked up their prices 25c per ton. As yet, there is very little evidence that they are making any sales, hut it is pretty clear that huyers are taking a little more interest in the market and are more readily picking up what bargains are offered. It is likely that when these have disappeared, they will settle into an attitude of watchful inactivity and test the new-found courage of the makers."

COPPER—The market is weak, with large buyers getting concessions. The markets at the East and also abroad are lower, an increase in the visible stock and quantity afloat being against the market.

COAL - Imports the past week aggregate as follows: Sydney, 2620 tons; Liverpool, 2300; Departure Bay, 2500; Seattle, 3600; totals, 11,020 tons. The market for shipment is reported stronger for hoth English and Australian. The spot market is essentially unchanged. Importers and large handlers continue confident that better prices will rule hefore the fall months pass.

Mining Share Market.

SAN FRANCISCO, Sept. 29, 1892.

The Share Market the past week under review, was quite active with lively and attractive fluctuations. On Thursday, Friday and Saturday the north end shares under the lead of Con. Virginia and the middle shares with Hale & Norcross the leader made quite an advance. The highest figures were reached on the Call, Friday afternoon, when Con. Virginia touched $5; Ophir $4.05, and Hale & Norcross $4.15. The Gold Hill shares under the lead of Belcher also showed a substantial advance. Belcher advanced from $3 on Thursday morning to $5.75 on Friday afternoon. Saturday the market eased off, opening weak and inactive on Monday morning for the north ends and fairly firm for the Gold Hills. In the afternoon the latter strengthened which led up to a rapid advance. Tuesday, at the Call, Belcher sold at $6 50. The advance brought in more outside buyers, but not of the class the reported broker for D. O. Mills appeared desirous of getting in. What the latter is said to wish is good substantial huyers, those upon whom the mill-rings can rely for assessments. On Tuesday the chipping fraternity and the large majority of "mud-hens" and "gutter-snipes" began to unload, taking their profit. This unloading was met by lower prices with a rapid decline on yesterday (Wednesday). The decline is generally accepted as proof positive that the inside does not want to take shares in at an advance, and in not being willing to do so it looks more than ever before like the usual thieving deals to which the public has heen treated since the spring of 1887.

Yesterday the north end and middle shares had a fairly steady tone, which gives the impression that the inside was about ready for another slight up in them so as to prevent a wholesale selling hy outsiders, in which event another up move would he only the more difficult to make. Perhaps this may be what the MINING AND SCIENTIFIC PRESS of Sept. 17, warned the public against. In that issue we said: "It looks very much as if D. O. Mills has instructed Bob Morrow to give the brokers a few crumbs by sending the market up and at the same time, provided gudgeons are drawn in, sell the market down after the leading shares are advanced to certain figures. In selling the market down there must, to make it a success, be rallying points." If this is not the move, then we will probahly he treated to higher prices than have yet heen reached so as to disarm the public of all suspicion and inspire confidence hy which they will hold. It will he the old game, "huy on the breaks for a turn," and the huying will he done once too often, when heavy losses and assessments will have to be met. As long as the mills are run hy private parties and the mines not worked to conform to the laws under which they incorporated, the public had better let the thieving game severely alone.

If the mines are being honestly worked and the ore honestly milled, why is there so much secrecy about everything? And why is the law under which the companies incorporated not conformed to?

It is a great game, this, of working the Comstock mines; it is assessments for the public and hullion for the insiders.

The official letter received this week from the superintendent of Crown Point reports 12 miners at work and 30 other persons in various wage-drawing positions. That is the way the money goes, pop goes the assessments.

The dummy directors in several of the mines are disgusted, for had they known that the present deal was contemplated larger assessments would have been levied, but they find comfort in the thought that the deal insures them assessments for at least a year to come. It is a great game, this, of working the Comstock mines.

The market opened this (Thursday) morning active, at lower prices, for the Gold Hill shares and fairly steady for the middle and north-end shares. After regular call, Belcher sold down to $3.60, but soon recovered to $4.10; then it began to shade off. As the noon hour drew near, the middle shares, under the lead of Hale & Norcross, made quite an advance—from 25 to 50 cents. There is a report on the street that the manipulators of the middle and north-end shares had unloaded on the Gold Hill manipulators, which broke the latter's shares, and that while breaking, Belcher, Crown Point and other shares in that and the middle and north-end shares were bought up. While we do not believe that there is any fight, yet it is quite likely that the selling and buying were done as report says, but it was in the interest of one crowd only. The market now looks as if the move is to be in the middle and north-end shares.

Our advices from the Comstock mines report that

n Con. Virginia they are getting ready to take out the very rich ore uncovered to the west on and around the 1700-foot level. If they attempt to take out the ore, we are authoritatively informed that the company will be enjoined by a west-side company which claims the lode. Our advices also state that it is said, the Savage Co., under the reform management of Geo. Wells, H. Zadig and one or two other inside reformers, is hoisting $300-per-ton ore at night and loading it on the cars at 6:15 o'clock in the morning. Our informant claims that he has good reason for believing this to be the case. It is a great game, this, of working the Comstock mines. Outsiders under the present system of working the mines, and of milling ore, have about as much show of getting anything out of the business as a hen without claws has of getting a living by scratching for worms. The showing now made in Belcher, if made a few years ago, would have sent the shares to $20, but the present manipulators appear to be content with a few dollars and assessments. In Hale & Norcross on the 1800 foot level they are cross-drifting for the west lode so as to cut its downward continuation. Good results (selling out shares) are expected to follow. The work in Mexican continues to be ignored, but perhaps the rings want more of the shares before reporting results. Every move that is being made looks more and more like all former thieving deals. Silver Hill, it is said, can pay dividends from the 2000 tons of rich gold ore which was extracted, and is now ready for hoisting. Trouble may follow if dividends are not paid. Very important work is under way in several of the mines, but it is hard to get particulars sufficiently verified to justify publishing.

Eastern Metal Markets.

NEW YORK, Sept. 29.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	38½	83	11 00	4 00	20 15
Friday	38½	83¼	11 00	4 00	20 15
Saturday	38½	83¼	11 00	4 00	20 15
Monday	38½	83¼	10 85	4 00	20 15
Tuesday	38½	83¼	10 85	4 00	20 15
Wednesday	38½	82½	10 85	4 00	20 15

Quicksilver has a steady tone. Pig tin is barely steady. Copper is lower and weak at the decline. Lead is offered freely. Pig iron is steady at the recent advance.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

STONINGTON PHOSPHATE CO. Object, to deal in all kinds of nitrates, guano and shell deposits in the Pacific ocean, and to acquire rights under Acts of Congress relating to the Guano islands. Capital stock, $100,000. Directors—Shafter Howard, J. A. Magee Jr., T. J. Harris, Jas. Madison and L. E. James.

SUMMIT LAKE WATER CO. Capital stock, $5,000,000. Directors—T. J. Parsons, Byron Jackson, A. W. Robinson, E. P. Rann, I. W. Ross, O. W. Forsyth and Wm. Strader.

COMSTOCK-WATSON CO. (Oakland). Capital stock, $10,000. Directors—M. L. Reqna, C. R Watson, Carl H. Abbot and K. G. Easton.

TAMAR MANUFACTURING CO. Capital stock, $100,000. Directors—Henry A. Hilton, O. H. E. Opie, J. H. Henderson, A. C. Wagner and John J. Hunter.

BARTON OPERA-HOUSE AND IMPROVEMENT CO. (Fresno). Capital stock, $300,000. Directors, Ella G. Barton, H. W. Chase, A. E. B. Ridley, E. de Reynier and J. O. Buxhee.

MATTIE W. MINING AND MILLING CO. (El Paso Co., Col.; office, Cripple Creek). Capital stock, $300,000. Directors—Joseph H. Wolfe Lloyd Jones, Edward I. Jones, Elmer E. Teal and John B. Whitehead.

FAIR CHANCE MINING CO. (Gunnison Co., Col.) Capital stock, $100,000. Directors—C. T. Harkman, W. D. Wright, J. W. Clarke, F. H. Shaw and G. W. Hart.

DEAD CREEK M. Co. (Denver). Capital stock, $1 000,000. The company will incorporate in Hinsdale Co., Col. Directors—W. H. Lindsay, D. M. Sponsilier, J. W. Lecky, L. J. McMurray, J. F. Gillen, C. H. Clarke, W. H. Winank, E. Morton and C. F. Mnssey.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPT. 20, 1892.

483,035.—BUNG—Anthony & Savage, Oakland, Cal.

482,775.—COIN-OPERATED AIR-COMPRESSOR—R. F. Avery, Spokane, Wash.

482,776—AIR PUMP—R. F. Avery, Spokane, Wash.

482,777.—OPERATING PUMPS WITH TREADLES—R. F. Avery, Spokane, Wash.

483,040—BARBED STRAP FOR BUNCHING LUMBER—E. C. Binet, Clipper Mills, Cal.

483 041.—MECHANICAL MOVEMENT—P. A. Bouchet, Merced, Cal.

482,914.—BITUMINOUS ROCK-REDUCING MACHINA—J. T. Cochran, Oakland, Cal.

482,918.—AXLE-LUBRICATOR—J. Q. Finch, S. F.

482,903.—STREET-RAILWAY SWITCH—J. P. Holedger, Spokane, Wash.

482 929.—CALENDAR—Rendell & Pinney, Tulare, Cal.

483,017.—LAWN-SPRINKLER—N. L. Rigby, Los Angeles, Cal.

482,853.—ORE-SEPARATOR—H. H. Taylor, S. F.

482,976.—HYDRAULIC-MOTOR—M. Van Ensley, McMinnville, Ogn.

482 881—PLOW—C. H. Vanderburg, Florence, Ogn.

482 989—WINDOW-FRAME AND SASH—Jas. Wilson, S. F.

The following brief list by telegraph, for Sept. 27, will appear more complete on receipt of mail advice:

California—John E. Armstrong, Santa Cruz, latch and lock combined; George Bryant, San Francisco, machine for grooving shoe soles; William J. Christy, San Jose, stringed musical instrument; Henry S. Grace, San Francisco, cigarette machine; Andrew S. Hallidie, San Francisco, grip pulley; Ferdinand Hoffman, deceased, by C. E. Hoffmeo, administratrix, fumigator; Benjamin Holt, Stockton, traveling harvester; Stephen M. Irvin, San Bernardino, flume gate; John Keao, San Francisco, chimney cap; George J. Perkins, Truckee, locomotive steam boiler; Alexander J Rudolph, San Francisco, two patents, one for a continuous file or index, the other for a library catalogue; Frederick C. Schroeder, Alameda, floor scraping machine.

Oregon—Nieles J. Blageo, Portland, device for closing elevator shafts; John H. Quloton, Portland, hose-hitching device; Frank S. Raeger, Germantown, reel support.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WINDOW-FRAME AND SASH.—James Wilson, S. F. No. 482,989. Dated Sept. 20, 1892. This invention relates to that class of window-frames in which the sash-confining parts of the casing or frame are so constructed that they can be moved out of the way to permit the removal of the sashes.

BITUMINOUS ROCK-REDUCING MACHINE.—John T. Cochran, Oakland. No. 482,914. Dated Sept. 20, 1892. This is an apparatus for the preparation of bituminous rock for the purpose of forming pavements, sidewalks and other surfaces for which it is applicable. It consists, essentially, in a series of oppositely traveling carrying belts inclosed within a casing and so arranged with relation to each other that each upper belt shall deliver its contents from the discharge end upon the receiving end of the belt below, and in conjunction with this of a series of guides to direct the material, and heaters by which the temperature is raised so that it will be in proper condition for the pulverizing and further work when discharged from the machine. The amount of heat is regulated by suitable cocks in the supply-pipe, so that more or less steam may be delivered into either set of the heating-pipes.

Our Agents

J. C. HOAG—San Francisco.
R. G BAILEY—Sao Francisco.
GEO. WILSON—Sacramento, Cal.
SAMUEL B. CLIFF—Crestoo, Cal.
A. C. GOODFRAY—Oregon.
W. H. MURRAY—California.
E. H. SCHAEFFLE—El Dorado and Amador Co's.
C. E. ROBERTSON—Humboldt Co.
CHAS. E. TOWNSEND—Nevada and Placer Co's.
R. G. HUSTON—Mootana.

DELINQUENT SALE NOTICE.

KEYSTONE CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of Works, Amador City, Amador County, California.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 3) levied on the 23d day of August, 1892, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
John S. Haver	11	238	$233 00
John S. Hager	130	100	100 00
M. J. McDonald	137	500	500 00
E. D. Rue, Trustee	138	925	9 5 00

And in accordance with law, and an order of the Board of Directors, made on the 22d day of August, 1892, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, 310 Pine St., Room 43, San Francisco, California, on TUESDAY, the 18th day of October, 1892, at the hour of 12 o'clock M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

J. H. ISHAM, Secretary.

Office, 310 Pine St., room 43, San Francisco, Cal.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN THE MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

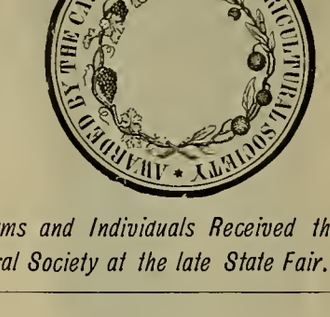
STATE FAIR, 1892.



The following San Francisco Firms and Individuals Received the Highest Awards of the State Agricultural Society at the late State Fair.

J. W. GRACE & CO,
BEST HYDRAULIC CEMENT, "Jasson."

WASHBURN & MOEN M'F'G CO.,
BEST WIRE ROPE.
BEST WIRE GOODS.

PELTON WATER WHEEL CO.
BEST WATER WHEEL---THE PELTON.
BEST QUARTZ CRUSHER---THE GATES.

ELECTRICAL ENGINEERING CO,
BEST DYNAMO AND MOTOR.
BEST SYSTEM OF ELECTRICAL POWER TRANSMISSION.
BEST ELECTRIC PUMP FOR IRRIGATING AND MINING.

W. H. OHMEN,
BEST COMPOUND AUTOMATIC CUT-OFF STEAM ENGINE.

F. A. HUNTINGTON,
BEST QUARTZ MILL.
BEST ORE FEEDER.

GEO. E. WOODBURY,
BEST CONCENTRATOR FOR ORES OF ALL KINDS.

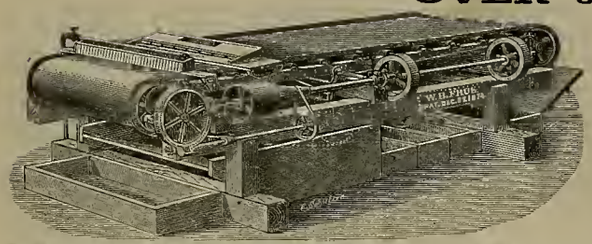
TROWBRIDGE & DYKES, Berkeley,
BEST WELL PUMP.
BEST MINING AND IRRIGATING PUMP.

A. T. DEWEY
W. B. EWER.
GEO. H. STRONG.
Dewey & Co.'s Scientific Press Patent Agency (ESTABLISHED 1860)

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies the information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not few. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, San Francisco.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.



Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

SAN JACINTO ESTATE, LIMITED,
Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Parsdox," "Triumph" and the "Woodbury" concentrators), extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

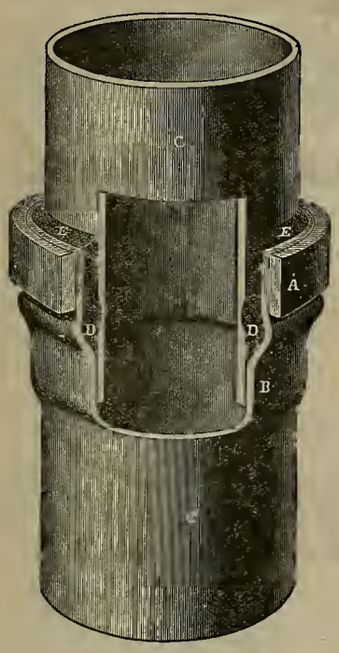
I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner..... 800. f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

For any information, or for pamphlets, or for circulars or testimonials, call on or address

H. J. SUMMERHAYES, Successor to Adams & Carter, Agent for the FRUE ORE CONCENTRATOR.
No. 132 Market Street. - - San Francisco, Cal.

Matheson Patent Lock-Joint Pipe.



A—Wrought-Iron Ring Shrunk on Pipe
B—Bell End Pipe.
CC—Body Pipe.
D—Lead Space showing point Lock Joint.
E—Lead Space.

SIMPLICITY IN CONSTRUCTION,

Permitting Handling Without the Aid of Skilled Labor.

A RELIABLE JOINT,

Whether Used on Light or Heavy Tubing.

A SAVING IN COST

Of Transportation as Compared with Any Other Style of Wrought or Cast Iron Pipe.

THE MATHESON JOINT is now used to a great extent by many of the largest Natural Gas Lines in the country, as well as for Water Works and other purposes. External diameters of either standard Wrought-Iron Pipe or Tubing can be furnished, and of any desired weight or gauge, in connection with the Matheson Patent Lock Joint, and in maximum lenghts and diameters as follows:

2	inches	to 4	inches	diameter,	16	to 20	feet	long.
5	"	8	"	"	20	" 26	"	"
9	"	12	"	"	20	" 25	"	"
13	"	20	"	"	20	" 24	"	"

WATER GATES, HYDRANTS, STAND PIPES AND ALL NECESSARY TOOLS AND FITTINGS FOR COMPLETE WATER WORKS. SPECIFICATIONS FURNISHED.

IRRIGATION PLANTS OF ALL KINDS,

INCLUDING HYDRAULIC RIVETED STEEL IRON PIPE, CAST IRON AND SCREWED JOINT PIPE AND FITTINGS.

Ball Automatic Steam Engines, Heine Patent Safety Boilers, Tubular Boilers, Iron and Steel Fluming, Davidson Improved Steam Pumps, John H. McGowan's Duplex Pumps and Triple-Plunger Pumps, Van Wie's Improved Centrifugal Pumps.

Varieties of Coal.

Prospectors are often puzzled when coal croppings are found, as to the variety and the method of distinguishing it. Of course an analysis will determine all the points but this is a matter of considerable expense. There are certain simple features which should be recognized on the field by all engaged in prospecting for coal. The different varieties of coal may be classed as follows:

Class I. — Hydrous, containing an excess of combined water; lignite; brown coal; pitch coal.

Class II.—Anhydrous, containing very little combined water; glance coal; semibituminous coal; bituminous coal.

1. Hydrous coal, containing 10 to 20 per cent of permanent water; lignite shows distinctly woody structure; laminated; very absorbent of water. Brown coal rarely shows vegetable structure; fracture irregular, conchoidal; color, dark-brown; luster, feeble; cracks readily on exposure to the atmosphere, losing 5 to 10 per cent of water, which is not reabsorbed; burns slowly; contains resin in large masses.

Pitch Coal. — Structure compact; fracture smooth; conchoidal; jointed in large, angular pieces; color, brown or black; luster, waxy; does not dessicate on exposure, nor is it absorbent of water; burns freely and contains resin disseminated throughout its mass.

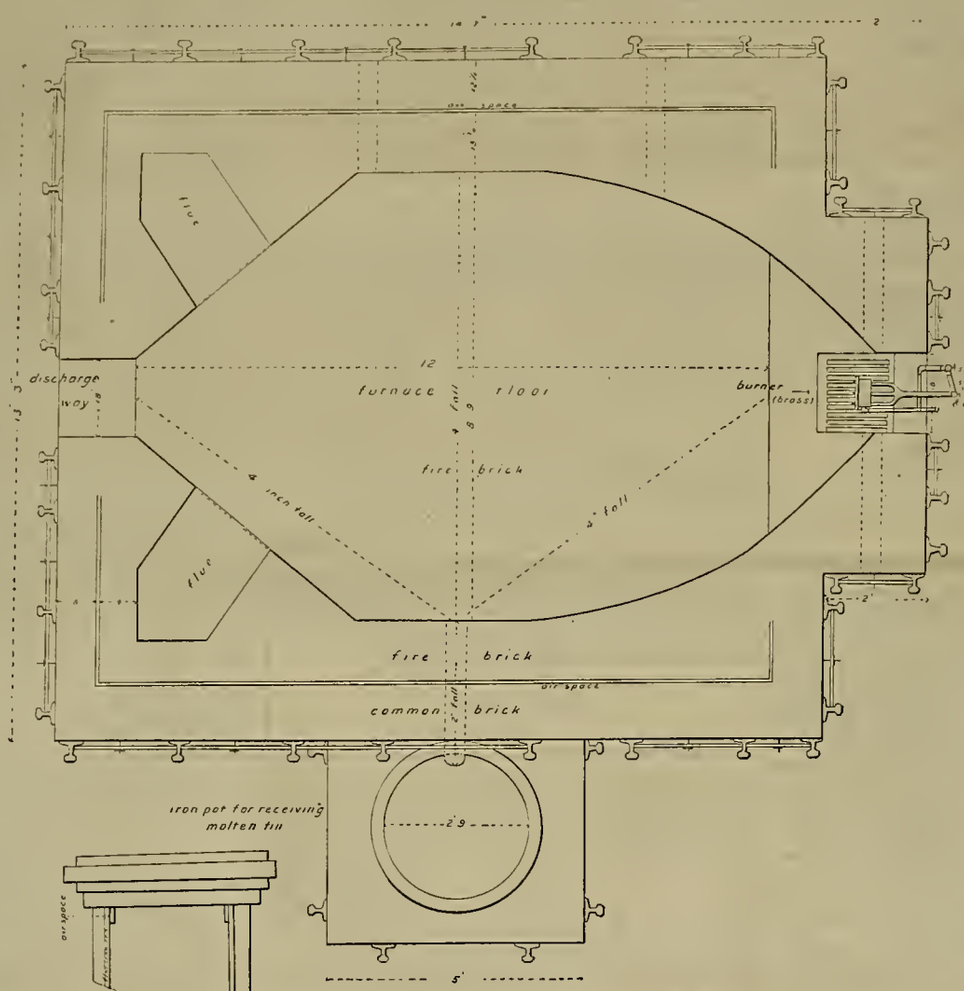
II. Anhydrous Coal. — Containing less than 6 per cent of water.

Glance Coal.—Noncaking, massive, compact or friable; fracture cuboidal, splintery; luster, metallic; structure, laminated; color, black; does not form a caking coal, but slightly adheres. This variety is brown coal altered by igneous rocks, and presents every intermediate stage from brown coal to anthracite.

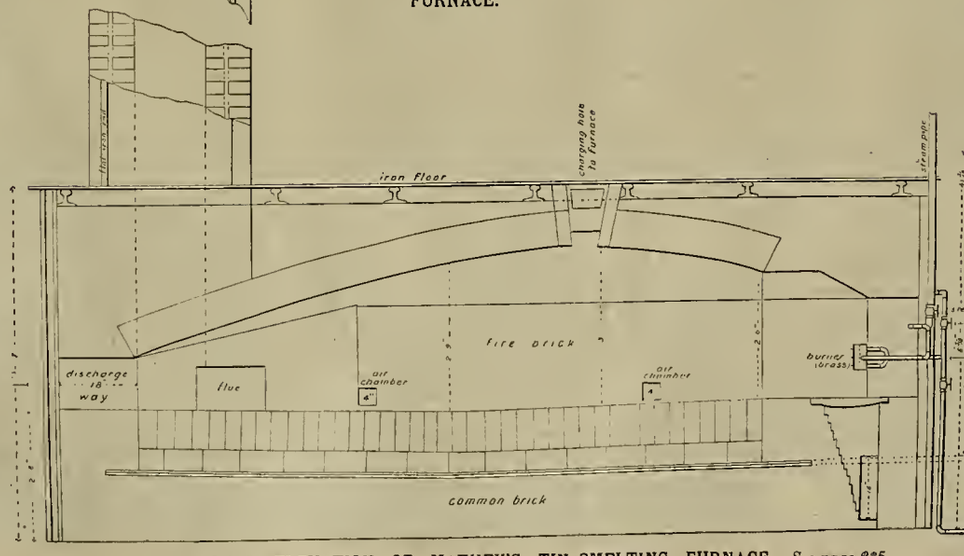
Semibituminous Coal.—Compact with laminæ of bright and dull coal alternately; fracture irregular; luster moderate; cakes moderately, or is noncaking.

Bituminous Coal.—Much-jointed, homogeneous, tender and friable; luster, pitch-like, glistening, often iridescent; color, black with purple hue; powder, brownish; cakes strongly, the best varieties forming a vitreous coke, with brilliant metallic luster.

Anthracite. — Consists almost entirely of carbon, and contains very little hydrogen, oxygen, or nitrogen, that is to say, it is almost free from bitumen — "a native coke." Luster bright, often submetallic iron black, and frequently iridescent. Fracture conchoidal, volatile matter after drying 3 to 5 per cent. Burns with a feeble flame of a pale color.



PLAN (INSIDE) OF TIN-SMELTING FURNACE.



SECTIONAL ELEVATION OF MATHEY'S TIN-SMELTING FURNACE.—*See page 235.*

THE silver-lead miners are having hard times of it these days, with both of those metals at such low prices. Many mines have closed down and more must follow unless an improvement manifests itself shortly. Aside from low price of products in the matter of heavy bullion, the freight charges of the railroads also militate against the profit of far western mines. For instance, the Bunker Hill and Sullivan mines, in the Cœur d'Alene, Idaho, have to pay $30 per ton to get their lead-bullion to Chicago. Mr. Haggin, in Montana, not many hundred miles farther east, gets a rate of $10 a ton to Chicago on his bullion. The far western mines have the worst of it on these freight rates, a few hundred miles farther more than doubling the rate. With lead at four cents a pound, miners' wages $3.50 per day, and freight $30 per ton on bullion to Chicago, a Cœur d'Alene silver-lea mine must have very rich to pay.

A MEXICAN mine, Cosala near San Ignacio, Sinoloa, is turning out $45,000 monthly. The plant consists of four hoisting and two stationary engines, a sawmill, a 25-stamp mill; the ores are treated by the old steam-pan process and the bars are all sent to Culiacan. The mines are managed by an American, Mr. Dodds.

Comment.

San Francisco capitalists have of late been turning their attention to Mexican mines, and now that there is a new mining law more favorable to mineowners, investments in that country will doubtless increase. Among the Mexican mines recently purchased by San Francisco men is El Bagre gold and silver mine in the Territory of Tepic, on the west side of the Arroyo Chimaltitan, a tributary of the Santiago river, and about 30 miles from Tepic. This mine has been purchased by El Leopoldo Gold and Silver Mining Co., of which F. Chappelet, the successful California miner, is president and Jabez Howes, secretary. Mr. Chappelet visited the mine a few months since in company with Ross E. Browne, M. E., who reported upon the property. It is on old Spanish mine, and some of the upper levels have been partly worked when Mexico was under the domination of the Spaniards. For years the ore has been worked in a crude way by arrastres, but modern machinery will soon be put upon it. This will be manufactured in this city and shipped down. It is the fashion for Americans to buy old mines in Mexico instead of opening new ones, for the old claims have been but partially developed, and seldom to any great depth. Yet enough work is generally done to prove the claim a mine instead of a "prospect." A cloudburst in the canyon did considerable damage to this mine last July, but last month they had again worked to within 60 feet of the place where there is known to be an 18-foot ledge. The ore contains both gold and silver and runs from $50 to $400 a ton. Some of the ore worked in this city has shown very high returns. The mine has been opened to a depth of 700 feet by means of tunnels, and more recently a 90 foot shaft has been sunk. There is plenty of water for power to drive a 20-stamp mill, compressors, etc. With a longer ditch a 40-stamp mill can be run. The ore can, it is said, be stoped, delivered and milled for $10 per ton with the cheap Mexican labor. It is an advantage to the mechanics and merchants of this city to have such mines owned here, since supplies of all kinds will be forwarded from this market. Arrangements are now being made with one of our local foundries for milling appliances for this mine. Generally, the ores of Mexican mines run to higher values than in this country; but while labor is cheap, supplies are more expensive and transportation rates are excessive. Once equipped, however, with all the necessary machinery, there is money for Americans in Mexican mines.

Next to Michigan and Montana, Arizona is the largest copper-producer in the United States. The ores are, in general, easily worked and occur in large masses. Of the copper properties, the principal ones being worked at present are the United Verde at Jerome, the Copper Basin, 13 miles from Prescott, and the Boggs, 28 miles from Prescott, and the Agua Fria at Stoddard. The United Verde is owned by W. A. Clark of Montana and is a splendid property, and well-equipped with all modern labor-saving appliances. They have three furnaces with a capacity of 200 tons a day, of which two are now in operation. It is estimated they have 25,000 tons of ore roasting at the present time. The ore is easily mined and cheaply reduced. The amount of ore developed in the mine is simply enormous. The Copper Basin and Boggs property belong to Dodge, Phelps & Co. of New York. As a smelting proposition the Copper Basin has not proved a success and they are preparing to leach a portion of their ores. The Boggs property is well-equipped with all appliances. At the smelters, of which they have three, they have Jig machines, Douglass roasting furnaces, in fact everything that a modern plant should have. The mine is two miles from the works. The ore is delivered to the works by narrow-gauge railroad, locomotive and cars complete, at a cost of 15 cents per ton. The ore is rebellious and some time has been lost in experimenting, but they seem to have solved the problem. The Agua Fria Company at Stoddard is in its infancy and there is still a great deal of development work to be done on the mine, but the prospect for large ore-bodies is good. The smelting plant is a 30-ton jacket designed for black copper-smelting, and will require alterations to handle their sulphide ores successfully.

Judge Hawley, in the U. S. Circuit Court, on Monday, rendered a judgment of great importance to the electrical industry, giving, as he did, a sweeping decision in favor of the Brush Co. as against the Electric Improvement Co. It was virtually a decision that the Wood arc light, owned by the Fort Wayne Electric Co., was an infringement on the Brush arc-light patent. In Chicago, New Orleans, Detroit, St. Louis and some other cities, this Wood system had crowded the other arc lights badly. The Wood system had in many places been proven the cheapest, giving, as it does, a 2000-candle light, at from sixty eight to seventy one-hundredths horsepower, which is much less than other systems require. As the horsepower shows the consumption of coal per hour, from a financial point of view, it is hard for other systems to compete with the Wood. This decision, however, puts it out of the way of the other competing companies. The judge upheld the Brush patent, issued a perpetual injunction and referred the case to the Master in Chancery to fix the amount of damages already accrued from the infringement. The defense has the right to appeal within 60 days.

Foundry Notes.

The most important feature of interest among the foundrymen this week is the final decision of the Fulton Iron Works to locate its new plant at Harbor View, on the bay shore of the San Francisco peninsula, instead of at Oakland, as had been contemplated. The proposed sight adjoins the Seaside Gardens at Harbor View, between Black Point and Fort Point, and consists of five lots fronting the bay, having about 980 feet of water frontage. The Union street cable road runs to the tract. About two-thirds of the tract purchased consists of solid ground, and the rest is in water lots, so that more ground can be made when desired. The water is deep off the bay shore in that vicinity, and there are none of the wide mud flats extending out as in the southern part of the peninsula.

The Hendy machine works have had their shops for some time near the seawall, at the base of Telegraph Hill; but with this exception, all the iron works in the city are south of Market street. The manufacturing sites, however, along the north shore are good ones, and when the seawall is completed and the belt railroad extended all around, more establishments will doubtless go in that direction. At present the buildings of the California Wire Works form the largest manufacturing plant in that direction.

The new site of the Fulton will be four or five times larger than their old premises, and they will have plenty of room for their proposed shipyard as well as their general foundry work. The Oakland people are much disappointed at the decision of the Fulton Co., having hoped the works would be built there. The bonus of $10,000 offered was small, and no guarantee of good title to the harbor privilege could well be given by the railroad company, their title being now contested in the courts.

A more potent reason for the change, however, is that James G. Fair, the millionaire, is to invest in the Fulton Company, and the land at Harbor View belongs to him The Fulton Works are to be incorporated with $1,000,000 capital. The incorporators will be the three original proprietors, Daniel B. Hinckley, James Spiers and Daniel E. Hayes, and also James G. Fair, F. A. Huntington, Henry P. Christie and Richard D. Chandler. A first-class plant will be built, and the buildings will be fireproof as far as possible. The firm has twice suffered great loss by fire. The plans will be drawn at once and work commenced as soon as possible.

Debris Dams Legal at Last.

A decision was handed down on Wednesday by Judge W. B. Gilbert of the U. S. Circuit Court in this city which will be hailed with delight by the mining community of this State. It is in effect that, upon a proper showing that debris dams are effective, the hydraulic mines may go on and work. The judgment was in the case of the United States vs. the North Bloomfield Mining Co., and the decision was contained in the closing paragraph of a long and elaborate opinion prepared after an examination of the impounding basins and dam of the mine by the Judge himself. It as as follows:

In short, the danger to be apprehended from the operation of the North Bloomfield mine, with its imponnding reservoirs as constructed and used, and intended to be used, is so remote and improbable that the court is not justified in enjoining the use of the property and thereby interdicting a valuable industry. In arriving at this conclusion, I am not unmindful of the great damage to navigation that has heretofore resulted from the deposit of mining debris, nor of the important interests that are involved, but I am convinced that in the case of this particular mine the contingency has arisen that was contemplated in the decision of this court in the mining-debris cases, in providing that the decree might hereafter be modified upon a showing to the court that a plan to obviate the injuries had been successfully executed.

The injunction will be denied.

This is the most favorable thing which has occurred for the hydraulic-mining interests of this State for years. The North Bloomfield is the most extensive hydraulic mine in California and was taken as the test mine in the original debris suit which led to the closing down of the mines under the Sawyer decision. In other instances where miners have built debris dams they have still been enjoined, so that the dams have been practically illegal because discolored water passed over them. In this decision Judge Gilbert speaks of this subject, and holds that the evidence goes to prove that this light, fine clay is of specific gravity very little greater than water, and will remain in suspense as long as the water moves with a velocity of a mile in two hours. Therefore, it is not likely to do any damage.

As this discolored water has been the cause of many suits against the miners, and the principal basis on which the Antidebris Association has been able to prevent the use of dams, the judge's opinion concerning it is highly important. The question of fact to be determined in this case was whether or not with the use and operation of the impounding works, mining debris escapes from the mine into the Yuba, Feather or Sacramento rivers, so as to tend to impair the navigability of those streams. The court decides that nothing of injurious character does escape, and that therefore the rivers are not injured.

Of course the decision is in a particular case upon a particular mine, but it is of such a character as to show that it will be followed by others of like character provided the impounding works are of a suitable nature to prevent the debris getting into the rivers.

The miners have always maintained that they could build such works and the antidebris men have maintained to the contrary. This time the judge personally inspected the impounding works and pronounces them satisfactory. This will be a bitter pill to the little clique of antidebris men who are trying again to start an organized opposition to hydraulic-mining in this State. They are organizing to prevent dams being built anywhere; but the same court which stopped hydraulic-mining now legalizes it under certain conditions, and says that dams will accomplish the object the miners have always claimed they would.

This is a distinct and decided legal victory for the hydraulic-mining interests of California. It is, moreover, in line with popular opinion and with the views of the Legislature of California and of the Congress of the United States. For years the miners have been fighting for permission to build and use these dams, but until now the decisions have been against them. In this instance it was not a debris association but the Government which is defeated, and the miners are given permission to go on with their work as long as they can keep their debris out of the navigable streams.

The immediate effect of this decision will be the application of other mines having impounding works, for permission to work. Moreover, other mining companies will build dams and arrange to commence operations. This decision will be a great card for the miners' side at the coming session of Congress, and will undoubtedly lead to the passage of the modified Caminetti bill by the Senate. The U. S. Engineers who reported that hydraulic-mining could not go on under decisions which made it illegal to discolor the river waters, will now find the rest of their opinions will be verified, that obstacle being removed by this judgment. That is to say, they could see no way of getting over that particular objection, but it being removed, they saw a way to permit mining to be resumed. It is now legally removed, and under the specified conditions mining can go on.

It should be a general subject of congratulation to the people of this State that the U. S. courts, anticipating the action of Congress and agreeing with the opinions of the U. S. engineers, should see a way by which the largest hydraulic mine in California can again be worked. We need the new gold from all these mines, and if a way can be found for one to legally work, the same means may be adopted by all.

Mathey's Tin-Smelting Furnace.

At the Temescal tin mines of the San Jacinto Estate, Limited, San Bernardino county, this State, during the past 18 months, they have been using a tin-smelting furnace patented by Henry Mathey, M. E., of this city, and in which oil is used as fuel instead of coal. Mr. S. Harris, the manager, states that the whole arrangement gave entire satisfaction. He is of the opinion that the construction of the furnace is of the best description and will eventually supersede the use of coal for smelting purposes in England. In the southern part of California petroleum is more abundant and cheaper than coal, and Mr. Mathey designed his furnace especially for use at the Temescal mines where the oil is easily obtained. Except in Cornwall, Great Britain, black tin is to-day, all over the world, smelted in blast-furnaces fired with charcoal or coke. The process is simple and the reduction easy, but the loss is much greater than in the Cornwall process, which is not generally adopted elsewhere on account of the difficulty of obtaining coal of proper quality without paying an exorbitant price therefor. During the smelting of the tin-concentrates in both processes the loss by volatilization alone, caused by too high temperature at times (which is very difficult to control), and also excessive draft, is equal to nine per cent in the blast-furnace, but is somewhat less in the reverberatory furnace. Another loss of from four to six per cent is caused by the excessive heat forming a vitreous slag which contains small globules of tin and particles of cassiterite, which are very difficult to recover.

Mr. Mathey designed his furnace with the idea of reducing the loss from these two causes (excessive heat and draught) to a minimum. The accompanying drawings show the furnace in use at Temescal, and which accomplished these results. One is a sectional elevation and the other a plan (inside). It will be seen that in effect the invention comprises the combination of a hydrocarbon burner and a suitable deflecting-roof arranged to receive the flame from the burner and direct the heat downward upon the charge to be smelted. The reverberatory furnace has its chamber narrowed by diagonally arranged walls at the end opposite to that at which the flame is introduced, and it is provided with two or more draft-flues, opening, respectively, from the chamber through this diagonal wall.

The ore is placed upon the iron floor and mixed with an addition of about 20 per cent of its weight of crushed coal. The oil-burners extend into the furnace from the front through the openings provided in the door-front. The burner is so arranged that it may be raised or depressed to direct the flame into the proper position for obtaining the best results. The burners may be of any of the well-known forms in successful operation, and do not require description here. The adjustment of the burner required to direct the flame so as to secure the best results is very slight, the object being to prevent draft upon the surface of the charge and consequent carrying away of the fine particles of cassiterite and tin.

The heat is reflected from the reflecting-roof, and thus operates to smelt the ore, with a scarcely perceptible loss from volatilization. Sometimes, when an extra heavy charge of ore is introduced and the surface thereof is elevated above the usual plane occupied by the surface of a charge, the lower portion of the flame from the burner may be thus brought so near the surface of the charge as to produce a draft. In such cases the burner is elevated by a hand-wheel sufficiently to remedy this difficulty. The ventilating-doors are hinged to the top of the door-frames, and are provided with isinglass-covered openings for observation. The doors are adjustable, to admit the proper quantity of air to the furnace.

In the rear of the furnace, in place of one central aperture communicating with the flue, two are provided—one on each side of the rear of the furnace—each opening into the main flue through short intermediate flues arranged diagonal to the flame so that the draft will not be so direct. In reverberatory furnaces as usually constructed, there is difficulty in securing equal distribution of the heat to all parts of the chamber, on account of the central flue causing a central concentration of the draft. By Mr. Mathey's arrangement of the flues, the heat is equally distributed on each side of the chamber, and superior results obtained thereby.

In working this furnace the oil burners are lighted and the furnace heated to the desired degree. The charge of ore and crushed coal is introduced into the chamber and properly distributed about the floor by a suitable implement. The burners are regulated to direct the flame at the proper point between the charge and the crown of the arch. The ventilating doors are opened sufficiently to admit the air necessary for perfect combustion, and when once regulated there is no occasion to disturb the doors until the reduction is complete. The amount of oil admitted to the burner is regulated from the exterior of the furnace and can be increased or diminished as desired. When the reduction is completed the slag is discharged through the proper opening, and on removing the clay-plug the metal flows off into the receptacle placed to receive it. It is then taken out by means of ladles and poured into the mould.

It is obvious that this improved furnace may be applied to various other uses besides the reduction of tin ores, but it is especially adapted for them. As stated, it has given satisfaction at Temescal, where it has reduced the ores from the mine in a thorough manner. Mr. Mathey has appointed as his agent for this furnace Mr. H. J. Summerhayes, successor to Adams & Carter, 132 Market street, in this city. No description of this furnace has heretofore been published because the patent has only just been issued.

Coast Industrial Notes.

THE Corralitos Water Company's system, including the electric-light plant, has been offered to the town of Watsonville for $150,000.

RICHARDSON BROTHERS' steam wagon, which runs over common dirt roads, hauls from 30,000 to 35,000 feet of lumber daily up at Truckee.

COMMENCING on October 7th, the rate on lead bullion from Utah common points to San Francisco, Stege and Vallejo Junction will be $10.25 a ton, instead of $11 as heretofore.

CONTRACTOR ROBERTS has about 60 men at work on the East Side canal. The canal has been completed from the railroad to the schoolhouse in Sumner, Kern Co. One mile of the canal through Sumner has been cut 2½ feet.

THE several applications for electric motive power franchises were rejected by the San Jose City Council on Monday, as the city exacted that the main supply wires be placed underground, which the companies refused to do.

A NUMBER of property owners on eighth street Oakland have filed a protest with the City Council against granting a franchise to McNear and others to run an electric road along that street between Grove and Franklin. The poles for the proposed road are already in place.

THE Pacific Construction Company will soon commence work in the main line sewer in South Berkeley. The attorney for the company finds that the annexation is legal. The company has put up a bond of $5000 to do the work. The contract price for the sewer is $15 000.

AT Volcano, Amador Co., Mr. Young, a miner, has put up an engine of three horsepower, which he runs with 30 cents worth of gasoline per day. It pumps out part of the south branch of Sutter creek, where the bedrock is very deep, and is supposed to be lined with gold.

GEO A. HARE, of Washington township, has applied to the supervisors for a franchise to construct a railroad between Grass Valley and Nevada City for the purpose of conveying passengers and freight between the two towns. The supervisors have the matter under advisement.

CONTRACTOR GRAHAM, who built the first section of the Lower California railroad last year, says he has the contract for another 50-mile section, and will begin work in December or when the rains come to give water along the line. This contract will complete the road from San Quintin to Colnett.

THE Austin, (Nev.), Reville says, that Superintendent Bray, of the Big Creek antimony mine, after many months of dead work, has put his force of men extracting ore. The first shipment of many months, of 90 tons, has just been made, and if the price of the metal will justify, large shipments will be made frequently.

PLANS are being prepared to be submitted to the Navy Department for the long-talked-of bridge across the Mare Island straits to Vallejo. In addition to these plans, others will be submitted for a large ferry-boat to be run at Government expense. It is, of course, not known which plan will meet the approval of those having the matter in charge.

THE receipts of quicksilver in September in this city, amounted to 1762 flasks. For the past nine months there were 13 978 flasks received, as against 10,581 flasks for the same period in 1891, and 9238 flasks in 1890. The exports for the first nine months of 1892 amounted to 16,844 flasks, against 3213 flasks in 1891, and 8811 flasks in 1890.

THE track of the Mexican International railway was completed to the depot at Durango on Sunday in the presence of 15,000 people, assembled on invitation of Contractor Robertson. The last three ties, decorated in Mexican and American colors, were laid, and the spikes driven by Governor Don Juan Manuel Flores and several other prominent Mexicans.

ON MONDAY the last installment of $10.600 was paid by the Oakland, Alameda and Piedmont Railway Company for the purchase of the Meetz road to Alameda. Already a track has been built from the Twenty-third avenue station over the new steel bridge to Park street and Santa Clara avenue. A new powerhouse will be constructed where the present carhouse stands.

THE Directors of the San Francisco and Atlantic Railway have filed with the County Clerk a certificate of the creation of a $20,000,000 bonded indebtedness for the purpose of locating and constructing a railrord between this city and Los Angeles, via the San Joaquin valley. The Directors of the enterprise are R. T. Harding, Frederick Horner, Lyman C. Parke, Green Majors and A. Judson.

THE new schooner, Prosper, of 224 tons net, which arrived Monday from Coquille river on her first trip, is built on an entirely new model from vessels in the coasting trade. She was designed as a light draught boat purposely to cross the Coquille river bar, which is very shoal at low water. She also operates two centerboards, one forward and the other aft. The schooner has a carrying capacity of 275 000 feet of lumber.

DURING the past two months the building operations in San Jose have been exceptionally lively and are significant of the fact that business men are confident that the city will support many more business houses than it has at present. The increased demand for carpenters and masons has caused many workmen from other places to come to San Jose for employment, and as a result there are more mechanics in town than needed.

FROM County Assessor Feudenthal's report to the State Board of Assessors and Equalization, the Pioche Record Lincoln Co., Nev.) finds that for the year 1892, 13,064 tons,)and 237 pounds of ore gave a gross yield of $359,507.73 and for 1891 10,368 tons and 1674 pounds of ore gave a gross yield of $276,765.57, being an increase of 2695 tons and 613 pounds, of the value of $79,742.16. The mining industry compared with the agricultural shows the sum of $190,087.13 in favor of the mines; the value of the agricultural products being $166,420 and that of the ore from the mines $356,507 73

BIDS to the San Francisco supervisors for the construction of a steel drawbridge over Channel street at Fourth were received as follows: P. McMahon & Sons $23.850, for old material $50; San Francisco Bridge Co. $30,387, old material $750; Coppman Brothers & Co. $28,842, old material $500; Healy Tibbets & Co. $28 465; McCann & McKay $25,690, old material $100; James J. Searle $26,300, old material $100. A resolution of award to McMahon & Sons was passed to print and the resolution referred to the street committee.

THE last rails on the Bakersfield and San Miguel R. R, connecting with Asphalto, were laid last week The men are now ballasting. Asphalto is 49 miles from Bakersfield. The completion of this road marks the enlargement of what is to be one of the most material interests of Kern—the oil and asphalt industry. The road to market is now at their very doors and prosperity is sure to attend them. Stevens station, 16 miles from Bakersfield, will be the shipping point for the oil, asphalt, sulphur, kaolin and other minerals of the Hazelton (Sunset) district, as well as of the lands to the south, and the junction point of oil pipe lines from that district. The Buena Vista Reservoir railroad, with its 12 miles of road completed, needs only 10 miles to form a connection with this branch of the world. Everything argues in favor of the completion of this branch, as, independent of the large freight in oil, asphalt and minerals to come over it, the cattle, wool, sheep, grain and hay of the San Emigdio, La Carissa and other grants will find thence a convenient outlet.

Personal.

MR. C. H. AARON is off on a professional trip to El Dorado county.

ISAAC KLOPP of Granite, Oregon, reports the placer-mining season just closed as a good one. The outlook of Granite is favorable.

J. P. CURRIER, of the firm of Carlson & Currier, will start the new silk factory in Petaluma Jan. 1, 1893, removing there from this city.

THE Oakland City Council has disposed of the idea of an electric road on Harrison street, both the Alsip and Davie ordinances having been defeated.

MESSRS. F. WUNDER AND E. W. MEIER have made some good locations at Bald Mountain, Oregon, 18 miles south of Baker City, at the head of Stices gulch.

A NUMBER of W. W. Slater's new pneumatic signal bells, recently described in the MINING AND SCIENTIFIC PRESS, are being placed at railroad crossings in Oakland.

GEORGE MOORE, one of the owners of the Weatherby placers, Oregon, better known as the Chicken creek diggings, says that the output this season will be about $13,000.

A. B. PAUL, of Middle Creek, Shasta county, the cyanide process expert, has just returned from a visit to the Mercur mill, Utah, where the process is being worked successfully on a large scale.

PROF. JOSEPH LE CONTE, of the University of California, who has just returned from abroad, was banqueted by the Academic Senate of the University at the Palace hotel on Saturday evening.

IT is currently reported that a sale of the Truckee Lumber Company's vast property is likely to be consummated. Experts are investigating the property, and if reports are satisfactory a good offer will be made for the entire lands, stock and business.

A. J. ROULSTONE, of this city, who is an expert in constructing and operating copper-smelting furnaces, is at Stoddard, Arizona, where he has just completed the erection of a smelting plant for the Agua Fria Copper Co. The plant is working satisfactorily.

PROSPER L. E. HUERNE, civil engineer and architect, died in this city on Saturday. He was for some years local agent of the Panama Canal Co., and carried out large dredging contracts on that work, obtaining much of the machinery and supplies in this city.

WHEN Superintendent Slater of the Southern Pacific's electrical department advocated an auxiliary boiler for the ferry steamer Oakland's electrical plant, many of his superiors doubted its advantages over working steam from the main boiler. The scheme has, however, already proven the more economical of the two.

L. O. NELSON, secretary of the Baisley-Elkhorn mine, Oregon, has perfected arrangements for a mill to be placed on the property of the Elkhorn Mountain Gold Mining Co, which is located just above the Baisley-Elkhorn mine and which gives promise of being a valuable property. The mill machinery will be on the way to Baker City in a few days.

THE Colton Marble Works have just quarried the largest block of marble ever taken out in this State. When squared up it will be 15 feet long, 5 feet and 4 inches wide, 6 feet and 5 inches thick and weighs 25½ tons. It is to be cut up into marble slabs 14 feet long, 5 feet wide and 2 inches thick, and will be used in the telephone company's new building at Los Angeles. Another huge block of the same size is being quarried.

MR. OTTO VON GELDERN is surveying Petaluma creek with a view to its improvement by the U S. Engineers. All the measurements are made with considerable detail, so as to base upon them the probable cost of any future improvement. A thorough study will be made of Petaluma river, so as to lay an intelligible plan before those directly interested in its navigability. What those improvements will consist of cannot yet be stated; dredging, however, being the principal work that will be done on places indicated on a chart made by the engineer now in charge of the surveys. The work is under the direction of Major W. H. Heuer, U. S. Engineer.

The Mines of Sierra County.

From Our Traveling Correspondent.

GRASS VALLEY, October 1, 1892.

TO THE EDITOR:—For some years mining interests in Sierra county have been seriously depressed, more so, perhaps, than any other locality in the upper portion of the State. Sierra is primarily, in fact solely, with the exception of its one valley, a mining section. So, naturally, the forced idleness of its hydraulic mines, the exhaustion or suspension of its principal quartz properties and also of its greatest drift mines, have tended in no small degree to blacken the mining eye, as it were, of the county. In a way, it has followed simply the course of evolution of every mining section. It has had its splendid "ups," hut for a long time has had to struggle with a severe case of the "downs." Sierra, however, is not "entirely dead." While there is a prevailing and infectious complaint of dullness, a lack of large-scale operations, and a prayer generally for a change, there is still more cause for hopefulness for mining interests as a whole than there bas been in years. The last year, and particularly the present season, has noted the turn for the better. In many places new men and new capital have come in and recommenced the work of development. It is believed—and everything seems to favor the belief—that there are just as rich mines still unexplored as those were that are now pronounced worked out.

The gravel mines may be said to be the operating and paying mines of the county at present. For quartz there is a flattering outlonk. But, with one or two exceptions where an old mine is working in a desultory manner, quartz properties are still in the state of a prospect, though only a few months more are necessary in several cases to raise these prospects to the dignity of a mine worthy of the days of Sierra county quartz mines.

WESTERN SIERRA AND HYDRAULIC MINING. — The vicinity of Scales, Port Wine, St. Louis, Gibsonville and Howland Flat has been particularly a hydraulicking locality. Consequently the prohibition of hydraulic mining wrought severe injary aad cut off an annual output, it is estimated, of nearly $2,000,000. As these claims were small ones and numerous, representing many individual owners and giving occupation to a great many men, it can be seen how immense the loss was. The result has been, not only depression, but depopulation. Where there were once 50 men there is now scarcely one; and the only reason this one is still here is because, in many cases, he can't help himself. Hydraulicking was never prosecuted here on a grand scale. Banks were low, the water supply limited, and the amount of earth that would be washed in a season would scarcely equal that torn away in a single week's run of some of the great lower-cuuntry hydraulic mines, and which were the ones that caused such havoc to the rivers and valleys. Furthermore, by the nature of the country, the isolation, the character of the streams, and above all, the impounding methods adopted, hydraulicking might have continued here until this day without damage to the country below or to the navigable rivers. The dams in Slate creek were built at the expense of the mines operating thereon, and under the direction of Mr. Chas. Deisen of the once famous Pioneer mine, and they will stand, for a conservative estimate let us say, as long as most of the surrounding mountains. At least, their insured permanency surprised the U. S. Engineers and met with their unqualified approval. A gentleman, who for ten years was a Yuba county supervisor during the height of the hydraulic agitation, told me a short time ago that be never knew the time when the North Yuba, below the mouths o Canyon and Slate creeks, was not clear enough to drink from, sufficiently clear at least to show the amount of sediment carried was insignificant.

I have dwelt this long on this particular locality to show that some hydraulic mines may and have been worked withnut being a "public or a private nuisance." There are many other mines and localities where the foregoing facts will apply with equal force. Of places that I have seen, I would apply them particularly to Spanish creek, Plumas county. Here also, many rich mines are idle that should be allowed to work, and could without the slightest damage. That any one living in these places has actually been obliged to resume hydraulicking in spite of the law, in order to secure the barest livelihood, is heartily poohpoohed by the opponents of the hydraulic system. The miner, naturally, will paint his own social picture in morbid colors, but there is far more truth in it than those who laugh without knowing what they laugh about will allow, or even the outside world is aware of. Despite the apparently successful progress toward resumption, miners generally are not unduly hopeful. The old men feel that the fight belongs to the younger generation, and that they will not be the ones to profit by later and intelligent legislation.

The fight has not been given up by any means, as will be shown by the assembling of the Miners' Convention in November, when each county will be represented by its full quota of delegates. Such are the intentions of Plumas, Sierra and Nevada counties at least. The latter is already prepared to send over 100 men, and the other counties are not far behind. To bring their cause before the whole body of the people is the object of these miners, and the time has certainly come when they must and will attract attention and gain notice through the daily press without having pay demanded for the privilege. The earnestness and popularity of this movement is in grand contrast to the weakening cause of the antidebris alarmists. A little instance may he cited here of the views of the latter on the question:

One day, not long since, a valley farmer living near Biggs, and possessed of some 2000 acres or more, and seemingly also of considerable intelligence, remarked to me in regard to hydraulicking, that he was not opposed to it if it can be prosecuted strictly within the limitations of Judge Sawyer's decision; but as he did not believe that possible, as a shovelful of dirt even thrown into a stream would contaminate it and become a "public and private nuisance," he further believed it would be the best thing in the world if drift mines and all were closed down, as *mining was but a barbarous institution anyhow*! Verily there is much truth in the story of the drowning man and the straw. My friend is not ordinarily considered a crank, but a conservative and thoughtful man and a lenient follower of Mr. Green. In quoting him, I have given him full justice, and were it not for the fact that I have met many other prominent and honest farmers who hold like marvelous views, his opinion would amount to little.

Fortunately for the world, the country at large, and this section in particular, the prosecution of mining is not dependent entirely on the good-will of our valley friends or the hydraulic system. There are many mines, representing an outlay of hundreds of thousands of dollars, that can be profitably worked in no way except by hydraulicking, and the capital here invested cannot be diverted to other channels because it is unavailahle for any other purpose. Where it has been possible, owing to favorable properties and sufficient capital, some old hydraulic mines have been converted into drift mines, but these are few and in no case have they as yet assumed important proportions.

THE PIONEER MINE, at Grass Flat, two miles north of Port Wine, is principal among this class. Work has been going on for the past two years and a tunnel of 1000 feet has been run. Little work has been done this season, as the mouth of the tunnel has been partially closed by slides which caused considerable trouble during the spring. This mine was immensely rich as a hydraulic, and bids fair to continue as a converted drift mine. Chas. Deisen is superintendent.

THE RIFFLE, managed and owned principally by Wm. Prosser, is another once prolific hydraulic mine, and lies below and near the Pioneer. This has been developed by a 2000-foot tunnel.

THE CHALLENGE MINE of the Treasure Bros., adjoining, is now working under a five years' bond by Mr. Wheaton of S. F. There are 2000 feet of main tunnel. A south side drift of about 200 feet this season has given splendid prospects for large developments. All these mines are reaching out for the Port Wine ridge channel. Their workings are generally eastward. However, it is not on these mines that the district is dependent for present support.

THE UNION, or, as is more generally known, the Happy Hollow mine, two miles northeast of Port Wine, taps the ridge from the Canyon creek side. It is a very old mine and in times past has paid richly. The channel is approached by a tunnel 2000 feet long, through hard bedrock. Thirteen hundred feet has been run in the gravel. In places the channel showed a width of 900 feet. When I visited it, a few weeks ago, the wnrk of "drawing out" the gravel pillars was in progress, and when that is done the future of tbe mine is uncertain. At present it is owned by a London company, and since March has been under the superintendence of G. W. Miller. A year ago, 150 men were employed, but only about one-third that numher is now working. That the receipts of the mine have been satisfactory the past season may be judged from the fact that since February $35,000 indebtedness has been lifted, consisting of liens filed on the property, all operating expenses met and still leaving a large surplus. This certainly speaks well for the present management.

THE SUFFOLK.—This mine is a mile north of the Hollow, at Wahoo, and on the same ridge. Owned by the Thistle Shaft Corporation, it has been worked for three years past on a lease by Messrs. David Moore, superintendent, and Chapman of S. F. Three thousand feet of tunnel, mostly in the bedrock, have been run. At present, work is going on in a north drift, 800 feet in. With the ground pitching, and sufficient pay gravel to meet expenses, Mr. Moore expressed himself satisfied with the outlook. About 30 men are employed.

THISTLE SHAFT, on the Gibsonville ridge and two miles below the town of Gibsonville, is the largest and one of the best-paying drift mines in the county. It is owned and operated by the Thistle Fork Gold Gravel Company, a Scotch corporation of immense and varied mining holdings. Mr. C. B. Wingate is managing superintendent. Operations have been going on here for the past two years and a half. This mine differs from nearly every other drift mine in the county, and in the State for that matter, in that all operations are carried on through a shaft instead of through a tunnel. In a district where water is as plentiful as it is here, and where the nature of the ground permits an approach to the gravel channel at most any depth required, it has often appeared strange to those accustomed to the ordinary method why this same method was not followed. Mr. Wingate states, however, that the company does not repent of its action, but is well satisfied. Four steam-pumps have no trouble in handling the water and the mine is kept remarkably dry. The shaft—triple compartment—is down 470 feet, to the bottom of the channel. From its foot 3000 feet of tunnels and gangways have been driven, and they are now working 1400 feet in. Five hundred feet in from the main shaft an escape shaft has been sunk to give further safety to the men and afford ventilation. Thus far the work has been mostly of a prospecting nature, but already it has shown such development as to prove that it is one of the big and paying mines. The gold extracted is of very fine character, both for size and quality.

The geological formation about St. Louis, Gibsonville and Howland Flat has of late started prospectors in a new and hitherto unexplored field. Thr nature of the gravel of the old hydraulic basin is that of washed and rounded quartz, pebhles and boulders. Frequently these have been found rich in gold.

Two broad helts of serpentine traverse the country, and running parallel with these, in a direction generally northwest and southeast, are numerous quartz ledges. Below this formation lie the auriferous deposits. It has previously been held by some geologists that this gravel was brought in by glacial agency from some unknown and perhaps distant quarter; but the foregoing evidence seem to disprove such belief.

It is only within the past few months that attention has been seriously attracted to these lodes. Interest once created, though, is steadily on the increase, and lately a number of locations have been made, as good prospects have been obtained in many cases. In speaking of quartz, F. G. Onkin of Strawberry valley is developing a promising ledge, known in early days as the Eagleville ledge. At one time there was an 8-stamp mill on the property, but the chute of ore becoming exhausted and dissensions arising among the owners, it was abandoned. A new chute has lately been found and a 5-stamp mill is to be erected.

I will continue my description of the mines of this county in another letter. CHAS. E. TOWNSEND.

Some Claims in Nye County, Nevada.

SUTTER CITY, SUTTER CO, CAL, Oct. 1, 1892.

TO THE EDITOR:—Having noticed in a recent issue of your valuable journal that you want to hear from mines in smaller camps and thus assist in the sale of undeveloped mining properties whose owners are not in a position to bring them to the attention of probable investors, I take the liberty to write you concerning some mines in which I am interested. The mines are ten in number and are situated in Nye county, Nevada. They are 54 miles from the narrow-gauge railroad at Leadly and 40 miles from Luning on the Carson and Colorado road. There are four mines in one group and six in the other, the two groups being four miles apart. There is a small valley between the two groups, and with reduction works in the valley the ore from all the mines would go down hill. The mines have been well prospected and the product is all smelting ore. It contains gold, silver and lead. Some of it runs $24 gold per ton and 260 ounces of silver. The balance runs from $40 to $50 per ton. There is plenty of timber, and water would have to be piped about two miles. There is an easy grade from either group of mines down to the valley. The mines belong to the estate of Alfred Welch, deceased, in which I am interested, and being so situated that I cannot develop them I would like to find some one to take hold of them, as I am sure if properly developed they are a valuable property. J. W. WELCH.

Asphaltum Deposits in South America

Asphaltum exists in great abundance near the Pedernales river, an estuary of the Orinoco, opening into the Gulf of Paria, where petroleum wells have been sunk with good results, and a company has been organized in Caracas to work the property. The machinery is on the spot and in process of erection. Inexhaustible mines of mineral pitch also exist near Maracaibo, Merida and Coro. Petroleum wells are abundant in Cumana and Trujillo. On the island of Pedernales, which is formed by the two delta streams, the Cucirina and the Pedernales, its northern shore being that of the Gulf of Paria, is found a vast supply of asphaltum. The land is low, intersected by small streams, and containing many ponds of salt and brackish water. In such ponds on the northern shore is found the asphaltum known as Pedernales asphalt. This differs in the main from that found at La Brea in Trinidad, in being generally more liquid, purer and freer from earthy matter, and in containing a greater percentage of oils. Like the deposit at Trinidad, this is found in a series of springs in conjunction with water, and, as at Trinidad, it forms a thick flooring of pitch in places, and to an appreciable depth. The Pedernales asphalt is remarkahly pure, and when refined, presents a hard, lustrous, vitreous fracture, and in appearance is identical with the Egyptian refined, known in trade as "Epure." As found it is a thick, black, viscous mass, without odor, and strongly adherent. The process of refioing consists in merely boiling it, thus depriving it of a large proportion of the higher volatiles and all contained mniture. Refining may be carried on to any degree, even to the extent of complete reorganization. The deposits at Pedernales may be said to be the same, geographically considered, as that of La Brea, notwithstanding that the Trinidad contains a quantity of earthy matter, well nigh inseparable, although mechanically mixed. These earths are mainly very finely divided clays, held in suspension by the viscous asphaltum. The presence of these impurities adds largely to the weight, and, while proving little detriment to the many uses of the material, debars it from many other purposes. The Pedernales deposit can be used for any purposes known in the art, and is as desirable for varnishes and chemical compounds as it is useful in increasing the elasticity of the asphalt, which contains too small a percentage of volatiles. The Pedernales asphalt can be refined to order, thus exactly fulfilling desired conditions imposed by users.—American Manufacturer.

AN organization is being perfected in Lakeport and vicinity for the construction of an electric railway from the Donohoe railroad to Lakeport. The company is called the Clear Lake and Russian River Railroad Company. The Board of Directors elected are W. J. Biggerstaff, F. W. Gibson, R. W. Crump, J. K. Fraser, W. B. Collier, H. C. Boggs, and D. W. White. D. W. White was chosen Treasurer. The capital stock of the corporation is $300,000. As sooon as the organization is completed it is proposed to go vigorously to work and secure enough of stock and subsidy subscriptions from the people of Lake county to induce capital to take hold of the enterprise. This can be done and Lake county can have a railroad within the next few months if the people want it. The county is now very much isolated, as long stage rides are necessary to enter it. Tourists do not now visit Lake county in any number, but would do so were there proper means of transportation. The region will be a favorite one for summer visitors as soon as they can get to Clear Lake by rail.

The Cyanide Process.

Remarks on the Discussion of Its Novelty.

TO THE EDITOR:—I am not a partisan of "the MacArthur crowd," whose "ooisy claims" fatigue me as much as they can Prof. Morton; yet, in the ioterest of candor and good faith, I must protest against the implication, which I have heard often, and which appears in Mr. Morton's article in your issue of 24th iost., that the process of extracting or dissolviog gold and silver from ores by means of potassium cyaoide was anticipated in any process of electiogilding or electrnplating. I also object to this implication because I think it weakens rather than strengthens the case against the "noisy claims" and exorhitaot charges of the patentees.

I hear aod read frequeotly that the knowledge of the soluhility of gold io aqueous cyanides is not new, and that is true, hut the evidence usually advaoced in proof is utterly fallacious and would he upset in very short order by any pateot lawyer. The solutioos of gold used hy electroplaters are oot made hy dissolving gold in aqueous cyanide; that would he too slow a process; they are prepared hy dissolving a *compound* of gold io that menstruum, and, during the electrogilding, the strength of the solution is maintained, oot hy the slow actioo of potassium cyanide, hut hy cyaoogen, which, in the ahsence of gold or any other metal with which it could cnmhine, would either he set free on the positive electrode or would form some compound with the constitueots of the hath, I confess that I do not know which. This cyanogen is the chemical equivalent of the gold which is deposited on the oegative electrode. There may, perhaps I may say must, also he a slow dissolving nf gold hy the ordinary action of the solution on metallic gold, hut that is of oo practical account in the operation; it is the action of the electrical current which releases gold from its union with cyanogeo on the ooe electrode, and simultaneously causes a combioation of gold with cyanogen at the other electrode.

Io electrogilding, the solutioo of cyanide of potassium serves merely as a solveot menstruum to keep in solution the otherwise hardly soluhle metal cyaoide which is the real electrolyte to be decompounded at one pole and recompounded at the other *simultaneously*. In this hattle of the forces, the potassium is not a priocipal, hut only a second; it does not combine with oxygen, as wheo gold dissolves, independently of precipitation, io aqueous cyaoides, and it needs no reeoforcement hy addition of fresh cyaoide of potassium except as it may gradually hecome oxidized through atmospheric action and other suhsidiary effects. So different is all this from simply dissolving gold in aqueous cyanide that I do not hesitate to affirm that a process of electrolytic solution (with simultaneous precipitation) of the precious metal in ores, whether using aqueous cyanide or any other liquid as a medium, and the cyaoides or any other compounds of the metals as electrolyte, would he eotirely clear of "the noisy claims of the MacArthur crowd," and if it could not he pateoted, that would not he on account of those claims, nor even hecause of the prior practice of electrogilding, hut hecause that *same thing* had heen dooe hefore, io the same menstruum and with the same electrolyte. As a matter of fact, ores have heeo worked hy electrolysis, and I helieve the chief difficulty has heen that hase as well as precious metals were extracted.

The operation of electrogildiog does oot prove that metallic gold cao he dissolved hy a solutioo of potassium cyanide without the aid of an electric current from an extraneous source. Metallic gold cannot he dissolved, to any appreciable extent, hy a solution of common salt, with or without access of air, apparently hecause chlorine is a more negative suhstance than cyanogen, aod it clings with more tenacity to the positive potassium; or, perhaps, it is hecause gold lies much nearer to the extreme positive eod of the scale when in cootact with a cyanide solution thao wheo in contact with a chloride. Similarly, hydrogeo-chloride will oot act sensihly on metallic gold *per se*, yet, under the influence of the electric current, gold dissolves and simultaneously precipitates in either one of the liquids oamed. It is, however, a fact that metallic gold can he dissolved hy means of a solutioo of potassium cyanide, without the use of a curreot, and this fact seems to have heen widely koown loog hefore MacArthur made use of it. I proved it myself, experimentally, ahout 1879, simply for verification of what I had read. But, hetweeo dissolviog gold in a heaker, on the scale of a chemical experiment, and extracting gold on a commercial scale from pyrite or other matrix, there is a distioct difference, which the patent office recognizes; it therefore hehooves those who would cast a douht on the validity of a pateot on the latter to show that *that* was done before. I hope some ooe will do so in ao uoequivocal manoer.

In regard to patents on metallurgical processes, I occupy a position somewhat analogous to that of the Irishman who was "agin the Goverooment anyway;" at least I want to know or helieve that a patentee deserves to he one hefore yielding my assent (a matter of small importance, however). I have thought and said that, eveo though the cyaoide process for ores may he as old as is claimed hy some, yet, ioasmuch as it was not in use aoywhere io recent times and is oot described in the modern staodard works on metallurgy, was not eveo known to maoy ahle eogioeers and metallurgists, the "MacArthur crowd" might well he coosidered deserviog of some compensation for hriogiog the process to our notice lo a practical working form. But have they done this? I hear of hut two places in America where success is *claimed*, aod I hear of many ailures. I hear of large sums of mooey heing paid (or promised) for rights, and I have not heard that the sellers of rights have made any effort to secure or promote the success of their clients.

The royalty demanded on this process is excessive in the case of low-grade ores. If a party must pay ten or fifteen thoosaod dollars for a district, and then pay ooe dollar for each ton of ore treated, he must charge *his* licensees more than one dollar per ton, or lose mooey; this is a heavy addition to the cost of working low-grade ores, aod if persisted io will not only restrict the use of the process, hut will stimulate rebellion against what seems to me to be a flimsy perogative at hest.

One of these days I may have something to say ahout the patents as puhlished io this paper on July 2d, unless this article should have the effect of eliciting a hetter argument thao that hased on electrogilding. In the meantime can aoy chemist or physicist tell us if there has ever heeo offered an explanatioo of the curious fact which the discussion of this process brings into unusual promineoce? I refer to the alteratioo of the electrochemical relations of hodies, in some iostances amounting to reversal, hy a simple change of the surrounding medium. Why, for instaoce, is gold oegative to quicksilver, in most solutions, and positive to it in a solution of a cyanide? C. H. AARON.

Shasta County.

The Scherer Group of Mines.

REDDING, Octoher 1, 1892.

TO THE EDITOR:—It is now seven years since the discovery, in this county, of a veio containing free gold, tellurides and sulphurets upon the Scherer property. The Eureka ledge was the first discovered. An incline shaft was sunk for 98 feet aloog the vein; a vertical shaft was then sunk for 75 feet, from which a crosscut tunnel was ruo to strike the ledge. This tunnel, when run for 35 feet, encountered a fault, hut a drift of 15 feet to the east showed the lead very stroog and 5 feet thick. It was in this drift that the large quantity of free gold was found that first attracted atteotion to the mine. The direction of the veio is slighily east of north, with ao easterly dip of 30 degrees. With a view to further developing the property, a tunnel has lately heen driven from the side of the hill, just ahove Salt creek, for a distance of 700 feet, with a dritt of 65 feet and an upraise of 30 feet. The general formation is a chloritic slate. The hangiog-wall is free, with marked evidence in some places of a slide. In the footwall there are spots frozen to the quartz, hut a clear gouge ohtains for the greater distaoce. Io a few places the quartz appears to he intermixed with the slate.

Adjoiniog the Eureka tellurium mine on the south side, and having a parallel directioo, lies the Hidden Treasury, as yet undeveloped. The Cleveland comes oext, 800 feet southerly from the Eureka, and also a parallel veio. This mine has heeo rapidly developed, and promises to he a very valuahle addition to the company's property. Work has heen commeoced upon it during the present year. The vein has an easterly dip at an angle of 60 degrees and averages 4½ feet wide. A shaft 6 feet in width has heen sunk to the depth of 98 feet. There is a clear gouge of 6 ioches on the footwall and 10 inches on the haoging-wall. A tunnel is being driven to crosscut the vein, and is now in 90 feet and has already crosscut two small veins—one 10 inches, the other 6 inches—hoth giving good assays. This tunnel is 150 feet helow the shaft and 250 feet below the summit. Five hundred feet southerly from the Cleveland, we come to the Shaefer. This mine was discovered five years ago. The course of the vein is northeast and southwest. The croppings are wide; a prospect shaft has heen sunk for a depth of 40 feet, showing a well defined ledge 3½ feet wide with an easterly dip of 65 degrees. Twelve hundred feet south of the Shaefer is the Herhert. This vein ruos northwest aod southeast, with an easterly dip of 75 degrees. Upon this vein a shaft has beeo sunk for a distance of 18 feet that shows that the average width is 10 feet as far as prospected. The Golden Rod and other ledges are also on the Scherer property. The title is good, as it is on an old Spanish grant.

A tramway with steel rails is oow io course of coostruction. It will he 2000 feet long, coonecting the Herhert, Schaefer, Cleveland and Eureka mioes. The engine is 35 h. p. with all late improvemeots; a concrete floor has heen laid in the engine-house. A separate engioe drives the fao for the tunoel. Two Phœoix air-compressor drills have heen used. The Cleveland tuonel is, however, heiog driven hy hand, hut it is Mr. Scherer's intention to have electric power from the works io Redding, which place is only three miles distant.

Middle Creek station, on the Califoroia & Oregon R. R, is only a few hundred yards distaot from the proposed millsite, which will he almost directly opposite the tunnel of the Eureka mine. Mr. E. W. Harlow has lately made some assays of the several mioes, having heen hrought from Oakland to examine the company's property. The following results were ohtained under the ohservation of the writer. The tests were made to ascertain the value of the ore in the newly-opened Cleveland mioe:

No. 1. Sulphurets of Cleveland mine, amalgamated without nitrate, yielded per ton $5184.44. This was so surprisiog to those present that a secood cupellation was resorted to; the result was unchaoged.

No. 2. Sulphurets of Cleveland mine amalgamated hy nitrate process, $1748.76 per too.

No. 3. Tellurium slate sulphurets from refuse oo dump, after nitrate process, $3 per ton.

No. 4. Free gold from two pouods of Cleveland ore, $85 26 per too.

No. 5. Seven pounds of promiscuous ore taken from the Eureka tellurium claim, $40.30 per ton.

A large number of other tests was made, the object heing to determine the accurate commercial value of the Cleveland ore, with the result of giviog ao average of $65 per ton. WM. GREGORY HODSON.

AN important strike has been made on the 2000-foot level of the Empire mine, Grass Valley. The Empire is the oldest mine in the State now working.

THE Centeonial, a Nevada Co., Cal., gravel mine, owned hy Comstock men, now has its main tunnel in 2500 feet.

Results of Irrigation.

WASHINGTON, Sept. 15, 1892.—The Bulletin of the Census Bureau, just issued regardiog irrigatioo in the arid States and Terriiorles of the West, cootains ioformatioo likely to he of value to business meo interested in land enterprises in that section of the country. It would appear that the results of irrigatioo have heen reasooahly satisfactory and that the irrigated lands have paid a fair profit. Of the 124 808 farms enumerated in the arid regiop in June, 1890, 52,584, or 42.13 per ceot, cootained land on which crops were raised in 1889 hy the artificial application of water, the entire area of land irrigated heing 3 564.416 acres—20 72 per cent of the total area of the 52.584 irrigated farms, 9.66 per cent of the total area of the whole number of farms enumerated, and ahout one-half of ooe per cent of the total land area of the arid region. To this must he added 1552 farms, containing 66,965 acres irrigated, in the western parts of North Dakota, South Dakota, Nehraska, Kansas and Texas, designated, for convenience, the suhhumid regioo, where irrigatioo is slowly making its way, as a method of agriculture always advantageous hut oot always absolutely necessary.

The average value of the land irrigated io 1889, with the improvements thereon, is found to he $83.28 per acre, and the average value of products for the year stated $14 89 per acre. By correspoodeoce with over 20,000 irrigators, fairly distrihuted through the arid and suhhumid regions, it has heen ascertained that the average first cost of irrigation is $8.15 per acre, aod the average value placed upon the water rights, where separahle from the land, $26 per acre, or over three times their origioal cost. The average annual expenditure for water, as distinguished from the purchase of water rights, is $1.07 per acre, and the average cost of the origioal preparation of the ground for cultivatioo, including the purchase of the laod at the Government rate of $1.25 per acre, is $12.12 per acre. By applying, with necessary modifications, to the eoumerators' returns the average ohtaioed for each separate State and Territory, it has heeo found that, in rouod numhers, the total investmeot in productive irrigation systems utilized in 1889, in whole or in part, was, up to June 1, 1890, $29,611,000. Their value at that date was $94,412,000, showing ao apparent profit of $64,801,000, or 218.84 per cent. In the same manner the aggregate first cost of the irrigated areas, with their water rights, not iocluding the farms of the suhhumid States, has heen ascertained to he $77,490,000, and the value of the same on June 1, 1890, $296,850 000, showiog an increase io the value of land and water rights of $219,360,000, or 283 08 per cent. Io other words, the laod irrigated io 1889 was worth oearly four times what it cost, oo allowance evidently heing made for failures. The total expenditure for water, includiog the mainteoance and repairs of ditches, in the arid States in 1889 was $3,794,000, and the total value of products $53,057,000. The number of artesian wells used in irrigation in the arid aod suhhumid regions in June, 1890, was 3930, constructed at ao average cost per well of $245 58, aod giving an average discharge of 54.43 gallons per minute. The area of land thus irrigated, averaging 13.21 acres per well, amounted to 51,896 acres, or 1.43 per ceot of the total area of irrigated land in the arid and suhhumid regions.

The following table shows the exteot of irrigation in States and Territories in the arid region:

States and Territories.	Area irrigated, acres.	Per cent of entire land surface of State.	No. of farms enumerated.
Arizona	55 821	0.09	1,448
California	1,004 233	1.01	53 259
Colorado	890,735	1 34	16,505
Idaho	217,005	0 40	5,654
Montana	350,582	0.38	5,664
Nevada	224 403	0.32	1,341
New Mexico	91 745	0.12	4,174
Oregon (a)	177,944	0 39	10,513
Utah	263 473	0.60	10,757
Washington (b)	48 799	0.23	11,237
Wyoming	229,576	0.37	3 216
Totals	3,564,416	0 50	124,808

(a) 15 Eastern counties only.
(b) 13 Eastero counties only.

The following table shows the total approximate cost of productive irrigatioo systems and their value in 1890:

States aod Territories.	Cost.	Value in 1890.	Increase.
Arizona	$465,000	$828,000	$363,000
California	13 005,000	39,446,000	26 441,000
Colorado	6,359 000	25 350 000	18,981,000
Idaho	1,029,000	2,860,000	1,831.000
Montana	1,623,000	5,273,000	3 650,000
Nevada	1,251,000	3,714,000	2,463 000
New Mexico	512,000	1,679,000	1,167,000
Oregon	826,000	2,755,000	1,929 000
Utah	2,780,000	7,072 000	4,292,000
Washington	197 000	642 000	445 000
Wyoming	1,281,000	3,801,000	2,520,000
Suhhumid region	273,000	992,000	719,000
Totals	$29,611,000	$91,412,000	$64,801,000

The following table shows the first cost of irrigated areas, includiog water rights and their value in 1890:

States and Territories.	First cost.	Value June 1, '90.	Increase.
Arizona	$1,114,000	$3 2 4,000	$2,090,000
California	31,814 000	150,535,000	118 821,000
Colorado	16,140,000	59,595,000	43.555,000
Idaho	3,320,000	10 091,000	6,771,000
Montana	4,968,000	17,354,000	12,386 000
Nevada	3,905.000	9 200,000	5,295.000
New Mexico	1,701,000	4,677,000	2,975 000
Oregon	3.288.000	10,143,000	6,855,000
Utah	7,022 000	22,198,000	15,175,000
Washington	759 000	2,440,000	1 681,000
Wyoming	3,459,000	7,212 000	3,753,000
Totals	$77,490,000	$296,850,000	$219,360,000

J. H. RAE, Jr., Superintendent of the Carson River Nev. Placer Mioing and Dredging Compaoy, has received advices from the East to make preparations for huilding a new hoat for dredging purposes, and he will prohahly leave in a short time to procure material in Sacramento or San Francisco for this work. It is understood that the company will put on a large clam-shell dredge this time, capahle of lifting 1,200 tons of material a day. The amalgamator now on hand will he used in connection with revolving screoes and concentrators, and nearly an entire new plant will he put in.

Mechanical Progress.

The Manufacture of Pool Balls.

The manufacture of pool balls is an industry of no minor importance in this country, and the method of making such is interesting. Formerly ivory was generally used in the manufacture of these balls, but of late years celluloid has sprung into use and is now employed almost exclusively. Balls made from the latter are more substantial and will wear out three or four sets of the ivory, and, furthermore, can be put upon the market much cheaper, in fact at less than one-quarter the cost of the latter. Another thing in favor of the celluloid spheres is their absolute unsusceptibility to atmospheric changes, whereas the ivory will shrink, swell and crack like wool under the same conditions.

Celluloid is, as is generally known, a composition of guncotton and camphor, and being naturally of a yellowish tint, for this use is whitened by the aid of zinc white. After the ingredients have been properly mingled with the aid of steam heat, the material is formed in blocks slightly larger than the balls to be made. That the balls may acquire the proper degree of hardness, these blocks are right here subjected to a pressure of 30 tons for each ball. The ball is formed from the block in a lathe, and to insure their being perfect spheres, an automatically operated knife, which cannot cut beyond a certain distance from the center of each ball, is employed.

Then comes the coloring. The first step in this process is to submerge the balls in vats of dyes, the parts not to be colored being protected by little cups of brass ingeniously fastened upon each sphere. In the plain balls of red, blue, green, purple or yellow only the round spot where the number is to go needs to be covered, but in the treatment of the striped balls the matter is not so easy. After they have been fished out of the pots the dyed balls are put on a lathe and made to revolve rapidly, while fine sandpaper is delicately applied, so as to smooth their surfaces. Then a keen knife, manipulated by hand, removes from them the thinnest conceivable shaving all over, which does not take off the color, because the dyes penetrate to a little depth Finally, sandpaper is again applied, and the balls are ready for the last process to which they must be subjected.

Then comes the varnishing and finishing. The balls are placed for this purpose in little wire cups which come into contact with them at as few points as possible, and a transparent lacquer is bestowed upon them by hand. They are then dried and are ready for market. The numbers which appear upon the balls are produced by rubbing plumbago into the marks left by a dye which is applied and cuts the figures just before immersion in the dye vats. Whereas, if these balls, if cut into chips, would burn and shrivel up instantly, in solid form explosion or other like disaster is impossible owing to their density.—Manufacturers' Gazette.

Care of Tools.

One of the duties of the smith, as it is the duty of workmen in every department, is to keep his tools in order. The great trouble in the smith-shop is the battering of the heads of tools and faces of hammers. This battering is due to impact, which is a change of the molecules induced by heat generated by motion. The constant blows set the molecules in motion and cause crystallization, which is simply the forming of the molecules into crystals, which are the natural form of solids as the spherical is of liquids, and by this reformation of the molecules, their cohesive powers are weakened and the strength and resistance of the tool lessened. Steel hammers and sledges become crystallized in less than a year, from constant use, and chip off at the outer edges and sometimes inflict painful wounds. More than one such case has been recorded where chips from hammers have caused the loss of an eye, and where serious wounds have been the result of a careless failure to keep the hammers dressed up.

Hammers and sledges also become hollow on the face, from constant use and neglect, which not only unfits them for use, but makes them liable to split. They frequently split at the eye, which is caused by crystallization, and those which are fullered at each side of the eye frequently break at the fullered portion, causing more or less damage and injury.

Aside from the danger of this neglect, the quality of the work is lowered. Imperfect tools cause the twist in the iron when swaged and the uneveness of the fullering, and that in smoothing off a flat piece of iron, one side becomes thinner than the other, and so on to the end of the chapter, so that, besides being a safer way, it is a more economical way to have the tools kept in proper order. If there is anything that looks shiftless, it is a tool bench with tools all battered up. While it is, of course, utterly impossible to have the heads in the best condition when the tools are in constant use, there is no necessity for leaving them till they are battered way down to the eye and beyond all usefulness and hope of repair, when an occasional dressing and repairing would make them safer and more useful, and at the same time increase their durability. The thrifty workman will not allow this state of affairs to remain, and will find time to keep his tools in good order, however busy he may be; as he realizes that it pays to do it, and in reality saves time in the work. A workman who understands his tools and how they are made will understand how to do this, and needs no advice; but to the apprentice, any suggestions in every line that pertains to his labor are welcome, and in the future we hope to have something more to say on this subject.—Amesbury Vehicle.

ANCHORS.— In the manufacture of its own chains and anchors, the United States claims to secure results otherwise unobtainable on the score of strength and durability, even making its own iron, using nothing but the finest of malleable scraps, and the process is unique. The metal, says the New York *Sun*, as withdrawn from the furnace a glowing white mass, is rolled into long flat slabs of about one inch in thickness, which are cut up into short lengths, to be again subject to intense heat; these, being withdrawn, are rolled into billets of a few inches square at the ends and about two feet long, which are now for a third time thrust into the furnace, and at a white heat are taken out by means of large tongs suspended by a chain from an overhead trolley wheel, then rolled quickly into rods of various sizes and a number of feet long, being allowed to cool gradually in the air. The rods are now cut cold into short lengths for the links, which are formed by again heating and placing upon a special contrivance and turned into a staple shape, the staples being then linked together, completing the chain; the ends welded together by hand, the joining piece then put on, the link being then complete, so far as workmanship is concerned. To test the work, a long ditch running on one side of the shop is provided at one end with secure fastenings and at the other by a hydraulic engine, by means of which the chain is drawn tight and subjected to so many tons pressure; if, under this, a link breaks or exhibits any flaw, it is rejected.

OIL AS FUEL.—When the interest among the naval and stationary engineers is so continuously directed to the question of utilizing oil as a fuel under boiler furnaces, it is interesting to observe something of the relative economy, under favorable circumstances, of coal and oil. In New Jersey, in competition with anthracite slack and Westmoreland coal, it has been found that if the oil he at 2 4 cents per gallon, it would compete with coal at $3 95 per ton, at a test of a 6000 horsepower boiler plant. With coal at $3 10 per ton, and oil at 2.25 cents per gallon, the coal was cheaper; and where, in the coal district, that fuel could be got at $1.50 per ton, and oil at 1 5 cents per gallon, the oil cost one-third more than the coal. The theoretical evaporation of ordinary oil is about 21 pounds of water per pound of oil, and they have been experimentally able to get 16.7 pounds of water per pound of oil 63° B. in New Jersey, and in New England 17.8 pounds of water to steam at 90 pounds per pound of oil. This evaporation is secured by that method by which the oil vaporized to gas in a retort is carried forward to meet warmed air at the burner. A much more efficient combustion is obtainable than when the oil comes as a fluid to the furnace, and many of the difficulties connected with the fouling of the heating surface are avoided.—Engineering Magazine.

IRON AS AN EVIL GENIUS.—Iron is so generally accredited as the most useful of metals that it seems somewhat strange to find it playing the role of a troublesome constituent. But such is the case from the glassmaker's point of view. To the worker in vitrified sand, iron is undoubtedly an evil genius. The public taste objects to the green color of ordinary commercial bottles, and demands a white or colorless glass. If the glassmaker could obtain pure materials at a reasonable cost, the making of white glass would be as simple as that of green. But as the minute quantities of iron in his materials are practically ineradicable, he must seek the desired end by chemical and chromatic methods. In its various forms, metallic, protoxide and peroxide, and the several mixtures of these states, the metal runs through the whole scale of colors—black, blue, green, yellow, orange and purple. All these colors are generally counted common and undesirable. Yet iron finds its way into the glass in so many ways that it is harder to avoid than any of the besetting evils of the glassmaker's work. It is in his sand, soda and lime, in the mixer in which he mixes them and in the barrels that bring these raw materials to the factory. It is in the clay of his pots, and the tempering-mills in which the clay is worked contribute a fair contingent. In the cullet is always to be found a number of nails, and the millings or blacks from the blower's pipes contribute a most baneful, because irregular, quota. Finally, the mischievous and holiday-loving gamin of the factory adds his mite from time to time. All his art and all his oxidizers, arsenic, nitrate and manganese, cobalt and nickel, must be pressed into the service of the glassmaker in order to bring to the nearly colorless state of peroxide as great a quantity of the iron as possible, and the remainder has to be hidden by chromatic effects.—Iron.

Scientific Progress.

What Sustains the Moon.

We have read how the coffin of Mohammed was poised without support in the mosque of the faithful, from which all unbelievers were so rigidly excluded; no material support was necessary to sustain the remains of the prophet, the body itself seemed ever on the point of following the departed spirit to the realms of bliss. A perennial miracle was indeed necessary to sustain the revered sarcophagus in space. The infidel, no doubt, is somewhat skeptical about this marvelous phenomenon, and now, as ever, the truth is stranger than fiction, says *Good Words*. Far over our heads there is a vast globe, larger and heavier than millions of sarcophagi; no material support is rendered to that globe, yet there it is sustained from day to day, from year to year, from century to century.

What is it that prevents the moon falling? That is the question which now lies before us. It is assuredly the case that the earth continually attracts the moon. The effect of the attraction is not, however, shown in actually drawing the moon closer to the earth, for this, as we have seen, does not happen, but the attraction of the earth keeps the moon from going farther away from the earth than it otherwise would do. Suppose, for instance, that the attraction of the earth were suspended, the moon would no longer follow its orbit, but would start off in a straight line in continuation of the direction in which it was moving at the moment when the earth's action was interrupted.

What Newton did was to show from the circumstances of the moon's distance and movement that it was attracted by the earth with a force of the same description as that by which the same globe attracted the apple, the difference being that the intensity of the force becomes weaker the greater the distance of the attracted body from the earth. In fact the attraction of the earth on a ton of matter at the distance of the moon would be withstood by an exertion not greater than that which would suffice to sustain about three-quarters of a pound at the surface of the earth.

QUALITIES OF LITHOCARBON. — Lithocarbon, which is a mineral somewhat resembling asphalt, is the most remarkable mineral of its class known. It is claimed that it makes a perfect insulator; that as a paint it will resist heat or gases of any kind; that it is capable of being rolled into a tissue free from odor, and practically indestructible when employed in the production of mackintoshes, canvas belting, waterproof tents, etc. It possesses peculiar powers, enabling it to enter and fill the pores of iron and steel, rendering these metals impervious to acids, etc. It is also said by *Iron* to make common leather waterproof, and it can be applied to wood-pulp for the transformation of that material into what looks and acts like ebony or horn. The saturation of a ship's plates with hot lithocarbon frustrates the attack of harnacles, and the plate will neither rust nor foul. A portion of the smokestack of the steamer Dean Richmond, where the heat, through the use of a blower, rises to 800° F., was painted with lithocarbon several months ago, and remains undisturbed and unblistered, while other parts of the vessel have necessarily been painted many times. A piece of sheet-iron covered with lithocarbon japan is stated to have been subject to an actual heat of 415° F. without crack or blister, and remained so tenacious that the iron could be bent at any angle without disturbing the glossy surface. For varnishing railway and private carriages, painting iron bridges, roofs, steamships, houses, etc., this material acts as an insulator, and it is reported that it will neither crack nor blister under any known atmospheric temperature. At great heat lithocarbon will soften, but it will not take fire at any point. If all that we hear of this mineral be true it will form one of the most widely useful substances of its class known.

MALE OR FEMALE SKULLS.—It has long been most earnestly desired to discover some anatomical feature which would enable us to distinguish the skulls of the sexes. Two years ago Virchow declared that all alleged modes of differentiation so far discovered were worthless. Very lately, Dr. Thiem-Cotthus, in the "Archiv fur Klinische Chirurgie," Band 37, describes what seems a satisfactory craniological criterion of sex. The os tympanicum forms part of the posterior wall of the glenoid cavity of the inferior maxillary, and also closes in front and below the bony meatus of the ear. It arises perpendicularly from the petrous portion of the temporal bone posteriorily, and turns backward, in the woman at about half the height of the mastoid process, but in man at a less height. In the male, the bone develops a sharp edge, which divides to form the sheath of the styloid process; but in woman this sharpened edge does not exist, the bone is rounded into a tubercular form, and the fossa is shallower and flatter. Thus, in the male this fossa-tympanico-stylo-mastoidea is small, and the posterior wall of the glenoid cavity extends so deep that it is not possible for the condyloid process to slip over it. In the female, it is so much more spacious that this feature alone will serve to distinguish the crania of one sex from the other, and it also explains the surgical fact that luxation backward of the inferior maxillary is observed only in women.

ARTIFICIAL IVORY.—Natural ivory under analysis shows albumen, gelatine, alumina, magnesia, calcium carbonate and tribasic phosphate of lime. By this process quicklime is first treated with sufficient water to convert it into the hydrate, but before it has become completely "slaked" an aqueous solution of phosphoric acid is poured upon it, and while stirring the mixture the calcium carbonate, magnesia and alumina are incorporated in small quantities at a time; and lastly, the gelatine and albumen, dissolved in water, are added. The point to aim at is to obtain a compost sufficiently plastic and as intimately mixed as possible. It is then set aside to allow the phosphoric acid to complete its action upon the chalk. The following day the mixture, while still plastic, is pressed into the desired form in moulds and dried in a current of air at a temperature of about 150° C. To complete the preparation of the artificial product by this process, it is kept for three or four weeks, during which time it becomes perfectly hard. The following are the proportions for the mixture, which can be colored by the addition of suitable substances: Quicklime, 100 parts; water, 300 parts; phosphoric acid solution (1.05 specific gravity) 75 parts; calcium carbonate, 16 parts; magnesia, 1 to 2 parts; alumina precipitated, 5 parts; gelatine, 15 parts.—Scientific American.

RANGE-FINDER FOR COAST LINES.—A range-finder for coast-line defense has been invented by Lt. Isaac N. Lewis, and the first one has been made by the Brandis Manuf. Co., of Brooklyn, and is now set up at Fort Wadsworth, on Staten Island. This range-finder requires a solid foundation as close to the shore-line as possible. The semicular hed plate is 11 ft. long and 8 ft. wide, and most accurately planed. An arm pointed at the center and moved by a hand-wheel, carries a telescope, horizontal and depression verniers, pencil and various bits of mechanism not described. A chart of the harbor is accurately adjusted under the arm, and as the telescope is made to follow a fixed point on the hull of an approaching ship, the movement and position of the ship is traced by the pencil on the chart, on a scale of 1-1000 ins. to 1 ft. Tests made upon buoys 4 and 5 miles distant indicated their true distance within a few inches. The instrument is said to be useful in coast survey work, "as by following the coast-line with the telescope an absolutely accurate map can be drawn." But as the iron bed-plate alone weighs 1800 lbs., and requires a very firm foundation, its use in this direction is not plain.—Engineering News.

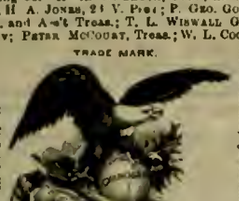
NEW DISCOVERY.

Mines Revived and Miners Enriched

By the wonderful **MacArthur-Forrest Process**, Controlled by The Gold and Silver Extraction Mining and Milling Co. H. A. W. Tabor, Pres.; Leonard Gow, V. Pres.; H. A. Jones, 2d V. Pres.; P. Geo. Gow, Technical M'g'r. and A'st Treas.; T. L. Wiswall Gen'l M'g'r. and Sec'y; Peter McCourt, Treas.; W. L. Cooper, Eng.

DENVER WORKS: On the D. & R. G. R. R., near the Broadway Electric R. R. Depot.

TRADE MARK.



(MACARTHUR FORREST PROCESS)

GLASGOW WORKS: The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Queensland, Etc.

General Office of Company:

Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: Denver; The Livingstone Gold Mining Co., Boulder Co., Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co., Cal; The Shasta Gold Ex. Co., Middle Creek, Shasta Co., Cal.; The Mercur Gold Mining Co., Fairfield, Utah; The Pacific Gold and Silver Extraction Co., Gro Grande, San Bernardino Co., Cal., The Gra B la Mining Co., Yavapai Co., Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz; The Union Mines, Maricopa Co., Ariz; The Revenue Con. Gold Mining Co., Revenue via Norris, Mont; and others in course of erection.

The object of this company is to introduce the Mac Arthur-Forrest process.

We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.

If you desire an experimental test communicate with the secretary.

If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons in Denver.

We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.

The process consists of pulverizing the ores to a fineness of about 50-mesh, and then subjecting the same to an action of a very dilute solution of cyanide. A few tubs especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or mills.

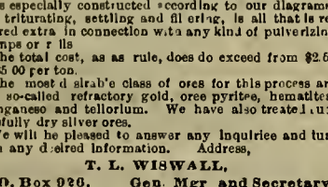
The total cost, as as rule, does do exceed from $2.50 to $5.00 per ton.

The most desirable class of ores for this process are the so-called refractory gold, ores pyritee, hematites, manganese and tellorium. We have also treated successfully dry silver ores.

We will be pleased to answer any inquiries and furnish any desired information. Address,

T. L. WISWALL,

P. O. Box 926. Gen. Mgr and Secretary.



QUARTZ SCREENS

"Transmission of Power by Manilla Rope" Copiously illustrated and described in catalogue just issued.

Electricity.

Long Distance Transmission of Electricity.

The enormous demand made upon electrical manufacturers in America by the rapid development of electric-lighting, and particularly of electric street railways, says the *Electrical World*, has resulted in keeping in the background the less pressing and perhaps more difficult problems, from an engineering standpoint, of long-distance transmission of electricity. In the branches first named, the engineering questions are relatively simple, or, at least, more uniform in character, with a minimum or no risk in their application, while in the manufacturing department their accomplishment necessitates, in general, merely the duplication of standard types. As a natural consequence, all energies have been devoted to this profitable though restricted field, and the questions requiring more variety, both from the manufacturing and engineering standpoint, have been for the moment disregarded. Perhaps the dominance of the direct current, and the suspicion with which alternating current motors have been viewed have also acted as retarding causes, but with the rapidly disappearing system of "systems," which gave rise to these electrical jealousies and prejudices, we are entering an era when professional science will have a free field. We dwell upon these points, because they furnish an explanation why in the branch in question we are so far behind Europe, and why the extensive problems of transmission at Niagara and the Calumet and Hecla mines necessitated the services of European engineers. Recently, however, we are happy to note a general tendency toward a recognition of the demands from this quarter, and once taken up, we may look for the same vigorous progress that has placed us so vastly in the lead in the other electrical branches we have made our own. Any one who gives the subject even casual thought must recognize its great possibilies, and it has been a matter of surprise to many impatient waiters for the realization of these possibilities to their profit that their advances have met with so little encouragement from electrical quarters. There is a vast number of important towns and cities in the United States that are within reasonable reach of waterpowers, either undeveloped or only giving up a fraction to manufactories alongside them, and often in regions where coal is dear. Even if this power could not be transmitted profitably for ordinary manufacturing uses, it would still in most cases be able to displace the expensive, both in first cost and operation, generating plants for electric-lighting and street railways, though to a less extent with the latter, if we assume the continued use of direct-current carmotors. In the gold and silver mining regions of the West, the high price of coal and often excessive cost of delivery render that field a peculiarly adaptable one, and here the work has commenced that will soon render electrical transmission the peer of its now overtowering rivals. The superior engineering qualities that will be developed in this department will not only have their effect in others, but the greater variety in design will, besides exerting a directly beneficial effect, have a tendency, no doubt, toward modifying our present too inflexible devotion to standard types of electrical machinery. Before long, we hope to have in our columns a gradually increasing section devoted to electrical transmission that will, in time, rival those now devoted to current electrical development.

ELECTRIC CASTINGS.—There is no end to the side applications of electricity, some of which, like "electric tanniog," appear to have a certain utility, while others, like "electric sugar refining" and "electropathic belts," are nothing but rank quackery. To which category the treatment of iron and steel castings with a current during solidification belongs we shall not venture to pronounce, but certain it is that a process has been devised by which an arc is applied to a freshly poured casting to retard its solidification and to allow it an opportuoity of becoming dense and homogeneous. The method can be used to add a portion of metal to the casting by making the former an electrode, and allowing it to fuse with the latter, or for keeping one part of the casting fluid, while the rest is allowed to solidify. In this case, a separate electrode of "coke graphite or molten slag" (!) is used. Metals which "boil" when solidifying are thus provided with a free vent for extruded gases. Silicon, and, lately, aluminium have been used with success to produce sound castings, the former being particularly effective in keeping the metal quiet, and hydraulic pressure has also been resorted to. It remains to be seen whether the new plan will aid in the manufacture of steel castings, which are often apt either to be unsound, or, if sound, untrue to pattern.—Industries, London.

The Day of the Electric Launch.

As a matter of fact, the electric launch is an unknown thing in this country. One or two boats have been built and put into commission, but at the present time there is hardly half a dozen of them. In Europe, however, these launches have become widely known. On the upper Thames, for example, it is impossible to spend an hour or two on the water without seeing several of them; and the number used by Londoners is rapidly on the increase. They are certainly preferable te the fussy little steam launches with their ugly "wash," and have not proved costly to build or maintain. Perhaps one reason for the rarity of electric boats in America has been the extreme popularity of naptha launches, whose name is legion; and another reason has undoubtedly been the greater length and width of our inland waters, rendering navigation by small craft more or less risky. A third reason may have been the comparative rarity of charging stations, but in view of the great use made of the incandescent light at our pleasure resorts along the water, this trouble lessens every season. It will be a long time before the Hudson, for instance, has the density and continuity of population that the Thames and Seine have; but even now its shores from New York to Albany are fairly well dotted with places where it would be possible to obtain a supply of current.

Moreover, we believe that with the unquestionable growth in popularity of aquatic sports and pastimes in America, there is to be found encouragement for the formation of local launch companies, such as that which is to carry passengers at the World's Fair. Just two years ago, Mr. Fred Reckenzaun, an authority on this subject, published in these pages a careful and exhaustive article on this subject, and gave it as his opinion that a complete charging plant, with 12 launches, each capable of running 60 miles at six miles an hour, could be equipped, all expenses for land, etc., included, for $32,050; These boats could be run for five months in the year for $905 apiece, making a total run each of 9000 miles in that time. If these boats carried about 10 passengers each trip, the investment would be profitable, at the low rate of a cent per mile. The figures seem to us quite reasonable, as they do not take into accouot any special hiring of the launches—a very profitable class of business; and we would greatly like to see the experiment made. The subject of storage launches is brought up again by the successful trip of the "Vashti." It is late to begin storage battery launch work for this year; but it is none too early to begin mapping out a program for next year, when Mr. Astor, with his new storage launch, bids fair to set the fashion in this field. He will be very extensively imitated. — Electrical Engineer.

INCANDESCENT LAMPS FOR MINES.—Considerable attention is being drawn to the question of lighting the breasts, rooms, and headings of coal mines by means of the incandescent lamps, not only on the score of a great effulgence of light, but also on account of the extra safety which is claimed on its behalf. The matter has been frequently discussed and has given rise to the suggestion that some definite test should be made to determine the exact status of the incandescent lamp in case of breakage of a mine where dangerous gases are present. Of course it is not proposed that the risk of an explosion should be invited before the subject has been solved beyond dispute, but it should be a comparatively easy matter to attain this solution in the laboratory, where every facility is at hand for the performance of such an experiment. It would be highly interestiog, for if it can be shown beyond doubt that the incandescent lamp possesses attributes as a lighting agency far beyond any of the known existing lamps, its general advent in mines throughout the length and breadth of the land will only be a matter of a short space of time. It is already being used in many extensive plants in Pennsylvania and Colorado and has given unquivocal satisfaction. So far, however, there is no record of such a lamp being broken in a gaseous mine, but it may on other grounds be cooceded considerable merit, for gas that might penetrate another lamp could not penetrate the incandescent (unless it was broken) since the vacuum is a safe preventive. There is so much at stake in the safety of lives and the security of property that considerable profit may reasonably be anticipated to accrue from a discussion in the premises.—Chicago J. of C.

Patent Agency.
ESTABLISHED 1863.
Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

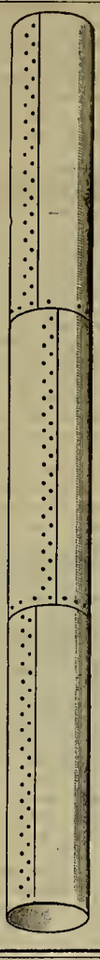
SHEET IRON PIPE



IRON PIPE
ALL SIZES, FOR GAS, STEAM AND WATER.
— WE MANUFACTURE —
SHEET IRON AND STEEL PIPE,
ALL SIZES.
For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.
Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.
In the manufacture of this Pipe, we use only a high grade of annealed Charcoal Iron of great tensile strength.
The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of **ASPHALTUM, PITCH and PETROLEUM, at a Temperature of 300° Fareoheit.** It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

Useful Information.

Something About Whetstones.

"An important industry of the world is the production of whetstones," said Curator Merrill, of the Smithsonian Institution, to a reporter. "Civilization may be said to depend primarily for its development upon edge-tools, and so it is ioteresting to consider the most improved methods so far devised for the sharpening of the implements used in the mechanical and other arts. The finest whetstone known for the sharpening of fine edge tools is obtained from Arkansas. In that State there are beds of what is called 'novaculite,' which is what is scientifically known as an 'altered schist.' This means a deposit of a flinty nature, usually combined with limestone, the rock thus produced being changed in such a manner molecularly, by processes not altogether understood, as to supply a surface most suitable for grinding. Arkansas furnishes the entire supply of novaculite for the United States, also filling a large part of the export demand, which is very considerable. The main deposit of the mineral is in a single hill, about 500 feet high. For the sharpening of keen edged tools, razors excepted, this novaculite is unrivaled. It is a very beautiful stone, of snowy whiteness, and is quite costly, because it has to be cut by diamond dust, owiog to its extreme hardness.

"Next in point of quality for whetstone purposes is a gray, fine-grained sandstone from Orange county, Ind. It is called, indifferently, 'Hindustan stone' or 'Orange county stone.' Very commonly it is made into long spikes for sharpening knives in the kitchen, and for this purpose it is far better than steel. Another sandstone employed for the same purpose is quarried in Cortland county, N. Y., and is called, without any reason, 'Labrador stone.' It is of a dark gray color. A still coarser whetstone, for scythes and other tools, is made from Berea grits, a sandstone found in the neighborhood of Berea, Ohio. Also there are certain qualities of fine-grained mica schists, a crystalline rock of quartz and mica, which are obtained from New Hampshire and Vermont, and utilized for hones wherewith to grind tools of the biggest sort. Nearly every quarry from which whetstones are derived is worked chiefly for obtaining building stone, the small pieces of particularly fine grade only being utilized for making whetstones.

"Three stones imported from abroad are employed in this country for whetstones. Best known of these is the German razor hone, used by barbers. It is found chiefly near Ratisbon, Germany, in the old river bed. During the era of geological formation the river brought down to that point mud, which was deposited on the bottom. The mud varied in material from one season to another, depending upon the source from which it was derived, so that during one year it was white, and during another blue. Because the white stone is costly, it is usual to back a thin slab of it with another slab of the cheap blue stone, fastening the two together with cement. Such is the ordinary razor hone of commerce. There are two other foreign whetstones commonly used in this country. One of these is a fine-grained schist from Scotland, known as the 'Water of Ayr,' and used much by carpenters and stonecutters for rubbing down the surface of other stones. The other is the 'Turkey oil-stone,' resembling novaculite.

"The stones used in this country for grindstones are mostly from Ohio and Nova Scotia, the latter supplying the best grade, which does excellently for scythes. Of foreign grindstones, most come from England. Of all whetstones, the most curious and interesting are those which are used by engravers to sharpen their engraving tools. They are of every shape imaginable, from long needle-like points to fine-edge sticks, the object being to grind the little points and edges of the steel instruments which could not be sharpened upon an ordinary stone."

AN ELECTRIC-LIGHT BATH.—An electrical journal illustrates and describes a new application of electricity, which consists in an arrangement for giving electric-light baths. We have often heard a sun bath mentioned as being beneficial, and it appears that the connection between light from the sun and that from electric lamps is supposed by some to be so close that the latter light can be used for similar beneficial purposes. The device by which electric light is applied consists of a closet whose interior is fitted with a number of 16-candle-power lamps. The closet is of sufficient size to accommodate a person when seated and leaves sufficient room so that they are not brought in contact with the lamps. The lamps are fastened to cleats standing out a few inches from the walls of the closet and the lamps lie flat so as to take up the least room and also present the largest amount of radiating surface. The walls of the closet, or that portion on which the lamps are arranged, are of polished nickel to give good reflecting surface. It is claimed that the effect of such a bath is most salutary and produces a buoyant effect. The person to be treated enters the closet and is seated on a projection on one side and a cover is put in place encircling the neck, but leaving the head free and beyond the influence of the light and heat. Current is supplied to the lamps through a resistance coil, the temperature being regulated as required. The lamps are arranged in sets so that light may be applied from any or all sides. It is stated that in ten minutes time the temperature of the closet can he raised to nearly 150 degrees, and a person receives the benefit of a combined light and vapor bath and the skin is given an appearance similar to that produced hy sunlight—that is, sunburned. It is suggested that if this treatment could be applied to the head also, it might meet with a large demand from those who cannot afford a summer trip to the country or seaside.—Invention.

The Evolution of Brass.

Brass has a respectable claim on antiquity. It was used in the temple of Solomon, was known in old Rome and in the middle ages, was associated with palace gates and monumental tablets, as it is to-day with buttons and pins. It has figured in architecture and statuary and varied its uses from representing the person of a monarch to the dignity of a doorknob. It is found in spoons and kettles, has honored the humble thimble and embellished the deadly cannon. In popular use and general service it has had a royal and ancient lineage, while its hard and unchanging complexion has furnished a metallic comparison for such human countenances as are more of brass than modesty. As an American industry, it owes its inception to an accidental shortage of supplies. When King George made his historic blunder and sent his fleet to blockade American ports, there was a consequent dearth of imported brass and official huttons. The latter was for a time substituted hy bone, but the metallic article, in spite of patriotism, drove the other out of fashion. Israel Coe, of Waterbury, Conn., made a canvass of the local housewives and solicited wornout copper kettles and saucepans. These were cut up by slow and laborious efforts, melted with other alloys in an iron furnace and capsized into rude molds. These uneven slabs of brass were passed through rolls until reduced to the desired thinness, the annealing being done in an open fire of chestnut-wood in the millyard. Success attended these crude and original efforts and led to the establishment of a rolling-mill at Waterbury, where the surprising output was made of 80,000 pounds of brass in one year. To-day they make annual totals of millions. The manufacture of brass kettles was a logical sequence, and the brass industry started in the Naugatuck valley perpetuates as it preceded American enterprise in this direction. It has deployed on every available line of service and kept in touch with the volume of demand and the fastidiousness of taste. It represents an industry with many ramifications, and has kept a level step with progress in improvement and manipulations. Its inception and development is, however, an added example of the persistent and energetic qualities so largely characteristic of American metallurgical progress —Age of Steel.

TELEPHONE SERVICE.—A paper read by Mr. Hugh Neilson before the Canadian Electrical Association makes some interesting comparisons between the long distance telephonic and the ordinary telegraphic service. He says that the long distance telephone rates in the United States are based on a schedule of one cent per mile, with a minimum charge of 50 cents. It appears that some complaint is made by the customers that for distances over 200 miles these rates are too high, but Mr. Neilson points out that owing to the unavoidable differences of conditions, telephone rates, unlike telegraph rates, must be considered from the same standpoint as railway tariffs, that of distance traversed. To carry on a telephonic communication requires the exclusive use for the time of two wires, while by applying the quadruplex system of telegraphy, four simultaneous communications might be sent at once on each of these wires, so that, all things considered, the earning power of a telegraph wire may be anywhere from two to eight or more times that of a telephone wire, computed on the basis of the number of words transmitted. Mr. Neilson therefore considers that the only necessary limit to the distance of telephonic transmission will prove to be a commercial one. He claims that Canada leads all other countries in the general use of the telephone, and asserts that more telephones are there in use, in proportion to population, and at a lower average rental, than in any other country in the world.

THE ARROW POISON IN THE NEW HEBRIDES.—M. Dantec has examined and experimented with the arrow-poison used by the natives of the New Hebrides. He finds that it contains neither vegetable poison nor serpent virus, but consists of earth impregnated with vegetable matter taken from marshy places and containing Pasteur's *vibrion septique*, or bacillus of malignant œdema also the bacillus of tetanus. If the arrows have been kept a long time, or have been much exposed to the sun, the *vibrion septique* may have been destroyed; the danger then is from tetanus. When the arrows have been freshly prepared and the *vibrion septique* is still active, a wound from them causes death in a guinea pig from septicæmia in from 12 to 15 hours; tetanus, which takes longer than that period of time to develop, does not, under these circumstances, show itself. It is interesting to remark that the horse is unknown in these islands, consequently the theory of the equine origin of tetanus would seem to be negatived by these researches.—Lancet.

ASPHALT PAVEMENTS AND GAS —An interesting observation respecting the deterioration of asphalt pavements by escaping illuminating gas is reported from Germany, where, at Frankfort-on-the-Main, asphalt roads that were put down in 1885–86, were shown to he much changed some two years later—1888. Cracks were observed, about one inch wide, quite similar to those in a dry field. In the interior the asphalt had become transformed into a tarry mass, which gave off the odor of illuminating gas That the escaping gas was largely responsihle for the changes in the roadhed would seem to be so from the fact that the alterations were almost altogether ahove the line of the gas mains. On taking up the pavement fissures were found in the concrete underneath, which permitted the gas to reach the asphalt. The carhohydrates were absorbed, principally the henzine. The asphalt became pasty and lost its cohesion.

FOR practical purposes the Mediterranean may be accepted as being what it is popularly supposed to be, a tideless sea, but it is not so in reality. In many places there is a distinct rise and tall, though tide is more frequently due to wiods and currents than to lunar attraction.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Cal voras Co., Cal., Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and have to at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requ ring no more oil, and no more wear and tear than the smaller t bles. My repair account for the past six months has been too small tomention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

Price of 4-foot wide Plain Belt Frue Vanner ..... $550, f. o. b.
" " " Improved Belt Frue Vanner ..... 800, f. o. b.
" 6-foot " Plain Belt Frue Vanner ..... 800, f. o. b.

For any information, or for pamphlets, or for circulars or testimonials, call on or address

H. J. SUMMERHAYES, Successor to Adams & Carter, Agent for the FRUE ORE CONCENTRATOR.
No. 182 Market Street, - - San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

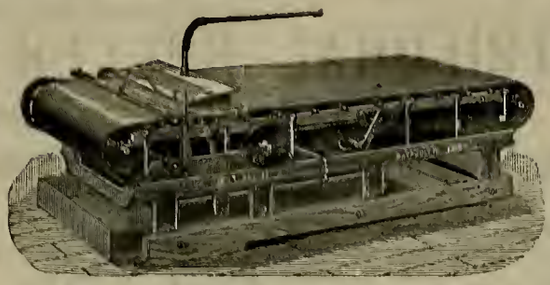
—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be.

Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

—o—

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1888.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

DAVID McKAY, Jr.,
Signed] Sup't North Star and Original Empire Mining Co.

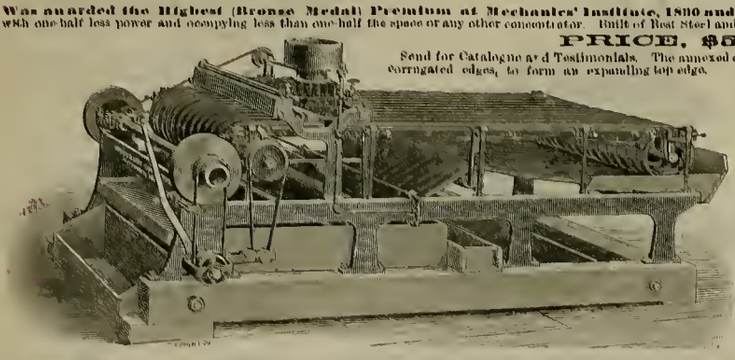
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

Was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1880 and 1891. MORE THAN DOUBLE THE CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of Best Steel and Wrought Iron. Strong and Durable.

PRICE, $575, f. o. b.

Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge.



THE SAN JACINTO ESTATE—Office of the General Manager. CAHUILO, Oct. 30, 1891.

GEO. E. WOODBURY, ESQ.—DEAR SIR: In reply to yours of the 27th inst., respecting the working and efficiency of the "Woodbury" Concentrator placed in our works by you, I am pleased to inform you that it is giving entire satisfaction; it has a much greater capacity than any other machine, and is doing fully one-third more work, with the concentrates a nally clean, as from either of the machines at work here.

[Copy] Yours faithfully, S. HARRIS, Manager.

THE SAN JACINTO ESTATE, LIMITED—Office of General Representative, P. O. address, South Riverside, San Bernardino County.

CAHUILO, February 17th, 1892.

GEO. E. WOODBURY:—Your letter of inquiry about your concentrator came to hand in due course. Your machine is doing well, the motion is all right, and the machine is giving entire satisfaction. Yours faithfully S. HARRIS.

PATENTED Aug. 19, 1890.

GEO. E. WOODBURY, Man'f'r, 213 to 219 First St., San Francisco.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

—BUILT SOLELY BY THE—

BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,

BUCYRUS, OHIO. U. S. A.

DIAMOND ROCK DRILLS.

For prospecting Mineral Veins and Deposits, Boring Vertically, Horizontally, or at any angle to any desired depth, taking out a Cylindrical Section or Core the entire distance, showing exact character, and giving a perfect section of the strata penetrated. Also for Boring Artesian Wells perfectly straight, round and true.

Machines for Channeling, Gadding and other kinds of Quarry Work, Shaft Sinking, Tunneling, Mining Railroad and all classes of rock-boring. Manufactured by

THE AMERICAN DIAMOND ROCK BORING CO.,

15 CORTLANDT STREET, NEW YORK.

P. O. Box 1442. Send for Catalogues and Price List.

THE JENCKES MACHINE CO., SHERBROOKE, P. Q., CANADA,

Sole Canadian Representatives and Manufacturers.

TUBBS CORDAGE CO.

(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal.

THE RUSSELL PROCESS.

For information concerning this process for the reduction of Ores containing precious metals, and terms of license, apply to

THE RUSSELL PROCESS CO.,
Park City, Utah.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

RAND DRILL COMPANY,

ROCK DRILLING, AIR COMPRESSING, MINING AND QUARRYING MACHINERY,

23 PARK PLACE, NEW YORK, U. S. A.

BRANCH OFFICES: Monadnock Building, Chicago; Ishpeming, Michigan; 1316 Eighteenth St., Denver; Sherbrooke P. O., Canada; Apartado B30, City of Mexico.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

SUTTER CREEK.—Amador *Ledger*, Oct. 1: Mining in this section continues to look more and more encouraging every day. The sound of the 40 stamps at the Hector is expected to be heard; the dumps in the mill and the big bin midway between mine and mill are full of ore. The compressor, which has principally been the cause of delay, is finished, and in a day or two sufficient men will be in the mine to keep the mill running steadily. The Belmont is running about as usual, with a very slim force. They are very much hampered on account of the incapacity of the hoisting machinery. The Wildman is running along in the usual prosperous way. The South Eureka continues to improve as developments go on. They have a ledge now on the east eight feet wide, which is sprinkled throughout with the precious metal in paying quantities, and they all feel confident that it is only a few months till the South Eureka will be classed with the best paying mines of the county.

STRIKE.—Wm. Sturnaman and his partner, Scott, have made a very rich strike in the Pioneer district. They found a ledge from 15 to 18 feet by 18 to 22 inches of free milling gold and sulphurets. Experts place the value of the rock in sight at from ten to fifteen thousand dollars.

QUARTZ MOUNTAIN. — The Gold Mountain quartz mine is still booming under the administration of Mr. Farwell and Wm. Ford. They have commenced operations on the McCulbert mine, with a small force of men. The Goodman is still at a standstill.

COYOTE HILL MINE.—*Dispatch*, Oct. 1: The Coyote Hill mine, above Ione, is turning out very rich. The main tunnel is in 800 feet. An 80-foot west drift found gravel that yields five cents to the panful. The channel at this point is from two to three feet wide. Fourteen men are now employed at the mine. They board at John Evans, near by, but Supt. D. G. Hughes of Sutter Creek says that the company will erect a boarding-house in the near future. A ditch six miles long, and just completed, furnishes water from the head of Cedar creek.

El Dorado.

TAYLOR.—Georgetown *Gazette*, Sept. 29: Few of our people comprehend the real magnitude or the importance of the Taylor mine, and the beneficial influence which its steady and advancing growth in bullion output is having upon the possibilities of our quartz-mining industry. One of these days there will be such an awakening in the development and milliug of gold-bearing lodes ou this divide as was never seen before. There is no boom in this slow but steady growth now going on. It is a cold-blooded, legitimate business advance, and for that reason few people catch on, as they belong to the old school of miners and businessmen who seem never to wake up and get a move on only when some one blunders on to a pile in the grass roots, or some new placer find. Our great lodes of milling ore have scarcely yet been prospected, and few of our resident population realize their extent and value.

THE INLAWILD GOLD MINING CO., whose mine is between here and Garden valley, is receiving a heavy consignment of machinery for the additional 20-stamp mill now going up. New buildings are being erected and the camp presents a scene of much life and enterprise.

Mono.

BONIE CON.—*Miner*, Sept. 30: During the last week, east crosscut No. 1, 550-foot level, has extended eight feet. North drift from Fortuna stope, above the 300-foot level, was extended six feet. Upraise from north drift, 200-foot level, was extended 11 feet. There were employed six miners, one carman, and jointly with Mono one engineer, one blacksmith, one watchman, one fireman, one foreman.

MONO. — During the past week we have cleaned out and timbered the main south drift, 50-foot level, a distance of 60 feet.

BULWER CON.—A north drift has been started from the flat upraise and driven in vein matter along the footwall a distance of 12 feet. An upraise has also been started from the old stopes south of No. 5 upraise, near the footwall, and it is now up 13 feet; the face is in vein matter of a favorable nature. Are rebuilding the main ore-chute from the Bulwer tunnel level up.

Nevada.

WYOMING MINE.—Grass Valley *Telegraph*, Sept. 29: The Wyoming mine, situated in South Grass Valley, is continuing to send out good ore. Samples brought to town to-day show well in free gold and carry sulphurets that are rich in the precious metal The Wyoming is indeed a most promising prospect and has a location that almost insures success as a big payer. Work is being prosecuted with the diligence and with proper economy.

CREEK-MINING.—Grass Valley *Union*, Oct. 5: Since the stoppage of hydraulic-mining the debris in Deer creek has washed out to such an extent as to permit of the resumption of sluice-mining in the bed of the creek, and there are now a number of white and Chinese miners at work in the vicinity of Nevada City, Newtown and other localities.

THE DELHI MINE.—Grass Valley *Union*, Oct. The present appearance of the Delhi quartz mine, on the Middle Yuba river, is very encouraging as to its future prospects. The lower tunnel, which is about 90 feet above the level of the river, has been driven to the vein and a shaft sunk upon it to the depth of 50 feet. The vein in the shaft is from 18 inches to 2 feet in width, and the quartz extracted from this shaft has paid all the expenses of sinking. One hundred tons of this quartz has been crushed at the mill, and has yielded an average of $20 per ton. The development is so good that pumping machinery is now to be put in which will be of sufficient capacity to handle any flow of water that may come in, as it is expected that when the shaft is sunk below the level of the river-bed that considerable water will have to be contended with.

Plumas.

EXPLORATIONS RESUMED.—Quincy *National-Bulletin*, Sept 28: Prof. J. E. Mills, manager of the interests of Agassiz & Shaw, in this State, is now preparing to resume explorations in American valley by sinking two shafts about two miles above Quincy. This is a very important move, and we are glad to chronicle it. It will result in scattering considerable money in this community—a very much needed article at this time. The enterprise should have the best wishes of every person in the county.

THE CRESCENT.—Several days ago a large body of ore was encountered in the Crescent mine, on the 400-foot level, in the drift running in a southerly direction from the shaft. The body of ore is what is known as the Horseshoe vein, and it is about ten feet wide. It is low-grade as yet, but may develop into something much better. Twenty-four stamps of the mill are now running steadily. The development just made is of very great importance, as it proves that the veins in that section go down. We believe this is the deepest quartz mine in the county.

GREEN MOUNTAIN.—Not a large force of men is employed in this mine at the present time, but the work is important. A rich body of ore in the face of the lower tunnel is reported, likewise good developments in other parts of the mine. The recent developments in the Crescent near by, which are probably 700 feet below No. 6 tunnel of the Green Mountain, furnish a strong argument as to the quantity of ore in the latter mine below the present workings. However, years will be required to exhaust the large ore-bodies beyond and above the face of the present lowest tunnel. There is no question that this mine is in one of the greatest mineral belts in this part of the State, the Crescent mine being the eastern development and the McGill & Standart the western. Intervening are the Green Mountain, the Altoona, the Indian Valley and others. From the Altoona, Judge Emmons is now crushing ore which, we hear, is paying him a good profit, although it is hauled about two miles to be milled.

MCGILL & STANDART.—Through the columns of this journal, our readers have become somewhat familiar with this property as the Drury mine, purchased by the present owners nearly two years ago, and successfully operated by them since. Twenty stamps of the Kettle mill are running steadily on ore from this mine. The mill, to which the quartz is hauled, is situated about half a mile from the mine. The owners have opened up the property, and while doing so, have extracted, during the past year and a half, close to $30,000. In the canyon east of the McGill & Standart propsrty, Firmstone, Richards & Cozzsglio are running a small mill on ore from the Phœnix. Although operated in a small way only, good reports come from the property. At Wolf creek, about ten days ago, McIntyre & Warren started a new mill on ore from a mine which they have been prospecting for some time. Not a sufficient test has yet been made to determine the value of the property.

Shasta.

SOUTH FORK NOTES.—Cor. Anderson *News*, Oct. 1: It now looks as though we were going to have reduction-works here at last. E. L. Ballou commenced work last week getting ready to put up a mining plant. He is going to put in a Tustin crusher and Frue concentrator, and then reduce the concentrations by the chlorine process. He will work both gold and silver ores. Mr. Ballou will only work on custom ore when slack of ore from his own mine. He thinks that by this process he can make $7 ore pay. Joe Moody is running his arrastre on ore that assays from $30 to $50 per ton, but all he can save with the arrastre is from $3 to $9 per ton. Quite a loss. The Shirland Bros. are working for Ballou, getting out timber for the new plant. They have several good mines that they will work as soon as they have any way of reducing the ore. Hubbard and Kingsbury have stopped work on their mine for a short time. They have some good ore on their dump, some of it assaying as high as $160 per ton. W. D. Bull has the boss mine so far. He has at the depth of 30 feet a fine showing, the ore streak being from 4 to 8 inches thick and worth over $250 per ton. Men who claim to be good judges say he has several thousand dollars in sight. Judge Read is talking of putting in a concentrating plant in a short time. He has located the old Willard water right, and will put in his plant somewhere near the Hubbard place on South Fork. J. P. Wright has several men at work on his mine and is taking out some good ore. Lewis & Co. have shut their mine down for a short time. Wm. Irelan, of San Francisco, father of the State Mineralogist, was here last week looking after mining interests. While here he located a millsite where the old Chicago mill stands. He is going to have it patented, and thinks there will be a party from the city in a short time to take charge of the old Chicago mine.

Sierra.

LONA STAR MINE.—Grass Valley *Telegraph*, Oct. 3: George Mainhart, superintendent of the Omaha mine, and Theo. H. Wilhelm have returned from the Lone Star mine, near Gold lake, in Sierra county. They found everything looking in tiptop shape up there. There is a ledge between two and three feet in thickness in the face of the tunnel, and they have fully 200 feet of backs. Some of the ore brought down can be seen at Theo. Wilhelm's butcher-shop. It is full of mineral and shows good coarse gold very freely. Mr. Mainhart thinks well of the prospect In a short while the company will hold a meeting and will then determine what steps they will take for working the mine this winter.

Siskiyou.

HUMBUG MINES.—*Telegraph*, Oct. 1: Mr. Hunt is down about 65 feet on a five-foot ledge, at the bottom of which he has formed a station for the purpose of running side drifts, but will also keep sinking. He is working both night and day with a force of 18 men. He is moving the old mill up to the new mine and it will be in working order in about a month. The Spencer mine is down about 280 feet, where the ledge has narrowed but is of very high grade ore, and they are taking out sufficient to keep the mill running constantly. The Boyle mine is working a full force of men, with indications of a very rich mine. He is in about 30 feet on his lower tunnel. The Humphrey mine is working a full force of men and are now transporting ore over their new road to the Hegler mill. They struck an exceedingly rich bunch of ore in their mine last week. The Jones boys have a large amount of ore on the dump which they intend crushing soon. Mr. Jackson has a crosscut of about 80 feet with a tunnel 60 feet in length on the ledge, showing up a fine body of ore. There have been several other good prospects found lately. This is a prosperous camp, with a very bright future in store for those who have property in this district. Lash & Morrison have cleaned up for the season, having made a very good season's run. They are now stopping at the Franco-American hotel and are both on the marry. This would be a fine catch for some of our young ladies, as they are both hard working young men, and money, "don't mention it." Cartwright & Phillips have about completed their air tunnel. They will now commence to open up stopes on the main ledge to get a large quantity of ore out on the dump before putting up their mill. They have a fine chute of pay ore in their air tunnel, which prospects fully as well as the pay chute on the main ledge.

Trinity.

FROM CINNABAR.—Trinity *Journal*, Oct. 1: We take the following from a private letter written at the Cinnabar mines in this county: Material for an occasional item from this camp will be very limited for some time, as I don't think the Integral Company will employ more than 8 or 10 men during the winter months. At present they have from 18 to 20 men steady on their work. They are building a furnace at the present time of over 30 tons capacity, and have been running their sawmill, with 10,000 feet capacity per day, for the past month. The lumber has been used chiefly in putting up new buildings, among which are a large boarding-house, a sleepinghouse for the men, also a sawmill and barn, and a furnace in course of construction, all of which are situated at what is known as the Boston mine. The company have also built a barn and are putting up a building euitable for a store and their office on what is knowu as the Altoona camp. The prospects for a large camp next year are very favorable.

Tuolumne.

A MINING STRIKE.—Modesto *Herald:* About a year ago the *Herald* made mention of a promising quartz claim in Tuolumne county owned and in process of development by M. A. Turner of Salida and W. E. Garrett of Ripon. The claim is situated on the Yosemite valley road, 25 miles this side of the valley and not far from Crocker's station. The owners have lately performed the annual assessment work on the property and have a tunnel in sufficient distance to cut the vein at a depth of 75 or 80 feet. A shaft about 15 feet in depth is also on the ledge. Recently a quantity of the ore from the vein, which is nine inches wide, was sent to Henry G. Hanks, of San Francisco, for assay. On Monday we were shown that eminent gentleman's assay certificate, by which it is seen that the ore yielded at the rate of $62.01 per ton in free gold and $1.67 per ton in silver. As Mr. Hanks remarks in a letter accompanying the certificate, this is unusually high-grade ore and will undoubtedly yield very profitable by mill process. Next spring and summer the owners propose to carry on development operations on quite an extensive scale.

NEVADA.

Washoe District.

CONS. CAL. & VIRGINIA.—*Chronicle*, Oct. 1: 1750 level—Have continued to extract some milling ore in working upward from the sill floor to east crosscuts Nos. 1, 3 and 5 from the main south drift, and from the point where the upraise from the end of the drift run south from the end of the crosscut run west from the end of the main southwest drift connects with the 9th floor openings. The upraise started in the crosscut run east from the end of the south drift last mentioned has been carried up 8 feet; total length 45 feet; in ore of milling value. Have continued making repairs to the southwest drift. 1800 level—Along the south end of the drift running south from the crosscut run east from the winze No. 1 sunk from the 1750 level, we have continued to extract some ore from the sill floor upward of milling value. In stoping upward from the drift run south from the crosscut run east from the bottom of winze No. 2, down 45 feet, have extracted some milling ore. There has been extracted from all parts of the mine during the week 1001 200-2000 tons of ore, which was shipped to the Morgan mill, the average value of which, per car samples, was $28.25 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $23.64 per ton per battery samples. Bullion shipped to Carson Mint, assay value, $17,492.02.

OPHIR.—1465 level: From the south drift, 101 feet below the sill floor of the 1465 level, from the Mexican into the Ophir ground, the west crosscut No. 2 has been advanced 14 feet; total length, 115 feet; in porphyry and clay carrying a little quartz of nominal value.

MEXICAN.—On the 1465 level, the west crosscut, which was started from the drift run north from the crosscut run west from the bottom of the winze sunk 101 feet below the sill floor of this level near the south boundary of the mine, has been advanced 23 feet; total length, 116 feet, continuing in a soft porphyry and clay formation.

UNION CON.—900 level: The joint Union Con. and Sierra Nevada west drift has been extended during the week 18 feet; total length west from the joint shaft, 2455 feet. The face is in hard black porphyry.

UTAH.—The north drift from west crosscut No. 2 has been extended 22 feet; total length 60 feet. This drift continues in porphyry formation showing some quartz with clay separations.

SIERRA NEVADA.—West crosscut No. 2, from Kenosha tunnel, started from south drift, 800 feet in, has been advanced 32 feet; total length, 180 feet; face in porphyry. The Cedar Hill drift has been advanced 14 feet, from which some pay ore has been saved; face in fair-grade quartz. No work has been done in the intermediate tunnel the past week, as we are engaged in putting in compressed air pipe and making wagon roads to the tunnel.

ANNEX.—East crosscut north on 420 level was advanced during the week 22 feet; total length, 164 feet; formation clay and porphyry.

GOULD & CURRY.—On the Sutro tunnel level, work has been temporarily discontinued in the face of the joint north drift, and the men are cutting a drain and doing some needed repairs.

BAST & BELCHER. — During the week east crosscut No. 2, 145 feet north of east crosscut No. 1 has been advanced 10 feet through hard porphyry; total length, 24 feet; also did considerable repairing on this level.

HALE & NORCROSS.—We continue retimbering main shaft above the 1000 level. Main Incline—Are making the necessary repairs. 1100 level—Have made some repairs to the north drift. 1300—Are retimbering the main north drift on this level. 1800 level: During the week advanced No. 1 west crosscut 25 feet; total length, 25 feet; face in clay, porphyry and streaks of quartz. West crosscut No. 2 on this level was advanced 18 feet; total length, 18 feet; face is in quartz of low assay value.

CHOLLAR.—We are making necessary repairs on the upper levels. The east crosscut, 160 feet south of north line, 930 level, is in 102 feet; face in soft porphyry.

POTOSI.—Extracted and sent to mill the past week, 442 tons of ore from the 550, 930, 1100, 1150 and 1300 levels. Average battery assay, $23.32; average car sample assays, $31.36. Shipped to the Carson Mint 370½ pounds of crude bullion.

BULLION.—The north drift from top of raise, 320 feet south of north line, 1300 level, is ont 37 feet; face is in porphyry and streaks of quartz. The joint southeast drift from bottom of Potosi winze, 1850 level, is out 92 feet from footwall; face is in porphyry and quartz. The northwest drift from 1800 station, Ward shaft, is out 900 feet; face in porphyry.

WARD SHAFT.— The joint Alpha and Exchequer west crosscut, 1800 level, is out 100 feet; face is in porphyry. The joint Potosi and Bullion northwest drift, 1800 level, is out 900 feet; face is in porphyry.

OCCIDENTAL.—From the stopes on 350, 400 and 450 levels we have extracted and milled 172 tons of ore of the assay value of $17.45 per ton as per battery samples.

ALPHA.—The joint west crosscut on our north line of Exchequer, 1800 level of the Ward shaft, is out 160 feet; the face in porphyry.

EXCHAQUER.— The joint west crosscut on the line of Alpha, 1800 level of Ward shaft, is out 100 feet; face is in porphyry.

NEW YORK. — The south drift from the winze, 50 feet below the 650 level, is out 30 feet; the whole distance is in fair-grade ore. The west crosscut, 800 level, 110 feet north of shaft, is out 22 feet; face in clay.

SILVER HILL.—We are stoping out on a streak of ore on the 400 level about 2½ feet wide that will assay from $25 to $30 per ton. Extracted and sent to mill the past week 199 1905-2000 tons of ore from the 260 and 490 levels. Milled during the week 199 1905 2000 tons of ore. Average battery assays, $20.47; average car-sample assays, $25.42.

Ely District.

CHAINMAN.—Cor. Salt Lake *Journal*, Sept. 30: The Chainman, at Ely, is improving every day and the big eale ie assured in the near future. McGill is making a success of the cyanide process of ore-reduction and saves up to 95 per cent on the Chainman ore. The Florida ie being worked in a capable manner by McDonal and Cupid, and will bring them money in the next year. Gen. Thomas and partners are working the Robust, Mohawk and others; all ehowing good gold ore. Williamson & Co. are working the Aurora, and light soon will come and they will reap a golden harvest in the near future. All this camp needs to make it second to none in the West is a little capital judiciously expended, and we will live despite the gold bnge.

Osceola District.

DAY-WAEHINO.—Cor. Salt Lake *Journal*, Sept. 30: At Osceola the drywashers are paying well and the O. G. Co. are having a very prosperous run, and have 35 men at work all the time. Millick & Co. have etrock it rich in the Comberland, eo I hear.

Ferguson District.

AT WOAK.—Ferguson *Lode*, Sept. 30: There is a force of men at work on the Jake mine, timbering and straightening the ehaft, and ae soon as thie is completed sinking will he commenced. The owners think they are on the Magnolia ledge and are confident the claim only needs development to make it a paying proposition. A new strike has been made in

the Gold Wedge mine on Gold Hill. Ore hes heen encountered which looks identically the same as the pay rock of the Magnolia, end the owners are, es a consequence, in juhilant spiri's. On Tuesday, the 20th inst., Mr. John Sevenoaks honded a one-fourth interest in the claim known as the South Extension of the Magnolia. This claim is owned by R. G. Crendall and C. E. Holt, and Mr. Sevenoaks takes Mr. Crandell's interest in the property. The price to be paid is $5000. It is wanted for the purpose of working the Magnolia.

ARIZONA.

SALVATION ARMY MINEES.—Tomhstone *Prospector*, Sept. 29: The claim on the south slope of the Auachuca mountains, heing worked by memhers of the Salvation Army, is proving to be e paying property. Two rock-crushers and a Frue-vanner concentrator are in place end ready to start up. The engine which runs the mechinery is a new one, and the trial run was successful. The concentretes are worth $300 per ton in copper and silver. Sufficient ore is in sight to run the works for three years. It is the intention to plant a colony at the mine, which is in a very picturesque part of the mountains. A number of salvationists from Los Angeles will join, and rules similar to the Topolobampo idea will be adopied on a broeder plene. The perty is a contented and happy one. Services are held morning end evening.

IDAHO.

SOUTH MOUNTAIN.—Ideho *Avalanche*, Sept. 27: All of Adams & Hnnt's and Berry & Hunt's mines heve heen closed out to a Colorado party represented by T. N. Shank. The deal includes the now famous Union mine, the first mine in South Mountein in which gold in paying quantities has been discovered. The new owners intend to develop the properties on a large scale, and have sent over a crew of miners for that purpose. Shipments of high-grade ore will commence at once, and within a month South Mountain will be heard from es a producer of the yellow metal.

BLACK JACK.—They are still drifting south on the vein, the ore continuing in about the same quantity and quality as when last reported. The winze is now down 55 feet in good ore, but water is hothering them considerably. Ore is still being sacked for shipment, though no stoping is being done at present.

BLAINE.—The Blaine tunnel is now in 1671 feet, and it is expected that the Trade Dollar ledge will he cut at almost any time.

TRADE DOLLAR.—Winze D from tunnel No. 3 has reached a depth of 105 feet. Sinking has been discontinued for the present, end a drift is being run north, now in 40 feet. The vein is five feet wide, one foot of which averages $200 per ton. In the 55 foot level, now in 60 feet, they have 16 inches of $500 ore in face of drift and in the stope. Returns were received Thursday night from the last car of ore shipped as follows. $884 per ton, or a fraction less than $10,000 for the car. There is nearly enough ore at the railroad, en ronte, and ou the dump for another car which will be shipped shortly.

SILVEA VAULT.—This pioperty was recently bonded by W. H Dewey, John Galey end E. H. Dewey. They have sunk a shaft 45 feet, but have not found the footwall. Thirteen feet of this ledge assayed from $33 to $240 per ton.

THE NEW CAMP OF DIXIE.—Cor. Elmore *Bulletin*, Oct. 2: Nearly everything in the way of development work is at a standstill, but prospecting is being carried on vigorously. It will he remembered that Peter Johnsen got a bond on three of the leading mines from the Wilson boys some time ago. Since then Mr. Johnsen has heen busy trying to sell the property to Eestern capitalists, and it is thought hy those interested that the sale will be made inside of two weeks, and, if so, the purchasers will put up suitahle machinery yet this fall for the reduction of base ores, and then Dixie will be second to no other district in Idaho, for we have good mines and lots of them. The Gold King mine, owned hy Groff & Kerchner, is now heing worked hy sinking a winze and shows a fine vein of very rich quartz. There have heen about 50 locetions made here this snmmer.

NEW MEXICO.

CROWN POINT.—Silver City *Enterprise*, Sept. 20: Tulloch and Givens mede a shipment of ore last week from their Crown Point mine in Cow Springs mining district. The ore ran 198 ounces silver per ton. This was an experimental shipment. There are large hodies of ore in the mine ready for extraction, end several tons on the dump, which will run much higher then the first shipment. The Piedmont district is steadily coming to the front. McDermot shipped 14 tons of ore to tbe Deming sampling works last week, which averaged $175 per ton. The lessees of the Alabama also made a shipment of the same amount to the same place which returned about the same.

ALHAMBA.—At this camp, in the Alhambra mine, in both levels the wonderfully rich ore for which this mine is famous has been encountered and severel tons are now piled in the orebouse to be broken np and sacked, or already sacked for shipment. Much of this ore is of too high a grade to risk transportation by freight and will have to be shipped by express or melted into bars of bullion at the mine. A large proportion of the ore from the mine will run above $8000 per ton. In the Hobson mine, in both the lower levels, rich ore of the same grade as that produced in the Alhembra, has heen found. The ore is native silver and argentite, the only approach to base metals found in the mines of the camp being nickle, which is found as an alloy with the native silver, and also as a sulphide assaying high in silver. There is prohably no mine in the country that can show as much development work done on as permenent and economical a basis as these two mines. They are both thoroughly equipped as to hoisting facilities, orehouses, and everything necessary to an economical system of mining, without further extraneous expense for years to come. In the MINING AND SCIENTIFIC PRESS of the 17th ult. there appears an article in regard to the rich ores of the Golden Fleece mine at Lake City, Colorado, stating that the ores were so rich as to necessitate the shipment of the ore hy express. Now, here is a camp that has made shipment efter shipment hy express, and not from one mine alone, but from four different properties. The Alhambra, the Hohson, the Solid Silver and the Rose mines all ship their high-grade ores hy express. Nor is this ore found in such exceedingly small bunches or pockets, but in regular chutes, as ore of lower grade is found other mining localities. There is in the *Enterprise* collection one piece of native silver-ore four inches in thickness and nearly a foot in length broken from a mass weighing several hundred pounds. This sample has heen prononnced hy professors connected with the Smithsonian and other great institu es the finest single specimen produced in the United States, and yet it would hear no comparison with other pieces produced from large ore-hodies in these mines. As, for instance, the writer has seen blocks of native silver which came from Solid Silver Company's mine which were 10 inches in thickness and 18 inches to 2 feet in length that were 80 per cent native silver, and on last Tuesday saw a block which was more than a foot in thickness and about 18 inches in length, showing by the fracture on either side that it came from a mass of equal thickness on every side.

MONTANA.

ON BOULDER CREEK.—Phillipsburg *Mail*, Oct. 1: R. T. Rombaner and Simon Johnson have made quite a nice strike on Boulder creek. Their claim is called the Meda and is located about three and a half miles above Medhurst, on the Mt. Powell road. They ran in on the vein about 30 feet above the lead from the incline shaft where they struck the first galena ore, about 50 feet in from the mouth of the tunnel. They have a lead about six feet wide where they are working, between two nice walls. The vein-matter is principally pyrites of iron and white qnartz and assays taken some time ago gave 90 ounces in silver and 40 per cent lead, with some gold.

THE ELIZABETH.—A new wagon-road is being graded from the Granite road down toward the Elizabeth boist, and a good many people are of the opinion that a resumption of operations will soon be hegun on that property.

ON BALD MOUNTAIN.—William Frazer, one of the owners of the Carpp & Frazer mine, on Bald mountain, was in town during the week and made known the important fact that they had reached the ledge in the west crosscut. The ledge where found is said to he quite extensive, but no definite knowledge of the ore-deposits could be ascertained. All the expert reports on this property have been to the effect that the permanence of the mine depended on the western developments. The Malony property, which joins Carpp & Frazer on the west, has lately heen bonded to an Eastern syndicate.

THE SALT HILL.—Work is being prosecuted steadily on Charles Clark's property, the Salt hill, under the supervision of Harry Clarke. It is not the intention to sink, as has heen erroneously reported. The purpose is to erect a shafthouse on the property. They intend to upraise instead of sink, and the present anticipations of those operating the property are to have the shafthouse built and the machinery in running order this fall.

OREGON.

MINING NOTES.—Bedrock *Democrat*, Oct. 1: The 65-ton mill plant at the Baisley-Elkhorn will be in operation about Oct. 1st. The mill plant of the Robinson Mining Company at Elkhorn mountain is about completed, and will be started crushing hy the first of the month. Its capacity will be 25 tons every 24 hours. The Hurdy Gurdy Mining Company is erecting a Tremaine prospecting mill on their property near Rock creek. The new ten-stamp mill on the White Swen mine is in course of building, and when in operation, large bullion outputs will be had. Geo. Borman came in yesterday from a prospecting tour in the Robinsonville country, and reports fair success. The Schnarr property at Greenhorn is said by those recenily visiting the mine, to be the greatest mine in the country. The placer season throughont Baker and Grant counties is about over, and the yield hes been greater than for meny years. The season's run at the Nelson mine is about closed. Good times are reoorted from Cracker Creek. The Eureka and Excelsior mines are running with a large force, and the mill of the P. R. M. Co. is pushed to its full capacity. The North Pole Company has a large force of miners employed, and the millbuilding operations are being pushed rapidly ahead. Upward of 300,000 pounds of machinery purchased in the East will soon arrive here. The Baker City Foundry and Machine Works is engaged in turning out 13,000 pounds of shoes and dies for the White Swan mill, hesides a large amount of other work for various mill plants throughout the country. It has been about conclusively demonstrated, we are informed, that the White Swen ledge is a continuation of the Virtue mine and is a true fissure. The sales of the great Le Bellevue at Granite and the Robbins-Elkhorn at Elkhorn mountain, should negotiations be closed, will give Baker county the moet extensive advertising in the mining world that hes ever before been her good fortune, and. from the very moment that capital takes hold, there will be an advance movement of the mining industry of Baker county that will bring about increased prosperity to our people.

SOUTH DAKOTA.

TIN-MILL.—Deadwood *Pioneer*, Oct. 1: It is now given out upon unsettled authority that the Harney Peak Tin Co. will endeavor to place its new mill at Hill City in operation by November 1st. Over 300 laborers are employed upon the railroad spurs to the mines, and their construction is being hurried with all possible speed. Operetors of the Minerva mine in Blacktail gulch are still engaged in pumping water from the lower levels. A large quentity of ore, broken and ready to mill, is covered by the water, and operations of the mill will commence as soon as the mine shall have heen placed in a thoronghly dry condition. The Welcome chlorination plent et Rapid City has heen closed down for abont ten days in order to give an opportunity to reline the present roasters with firebrick, end to put in position the machinery for the two new roesters which is expected deily. When the plant starts up again, it will have a largely increased capacity, and will give employment to an increased force of men.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPT. 27, 1892.

483,318.—LATCH AND LOCK—J. E. Armstrong, Santa Cruz, Cal.

483,416.—DEVICE FOR CLOSING ELEVATOR SHAFTS—N. J. Blagen, Portland, Or.

483,319.—MACHINE FOR GAOOVING SHOE SOLRS—Geo. Bryant, S. F.

483,136.—MUSICAL INSTRUMENT—W.J. Christy, San Jose, Cal.

483,380.—CIGARETTE MACHINE—H. S. Grace. S. F.

483,442.—GRIP PULLEY—A. S. Hallidie. S. F.

483,484.—FUMIGATOR—F. A. Hoffman, Byron, Cal.

483,449.—HARVESTEA—Benj Holt, Stockton, Cal.

483,455.—FLUME GATE—S. M. Irvin, San Bernardino, Cal.

483,384.—CHIMNEY CAP—J. Keane, S. F.

483,473.—LOCOMOTIVE STEAM BOILEA—G. J. Perkins, Truckee, Cal.

483,514.—HORSE-HITCHING DEVICE—J. H. Quinton, Portland, Or.

483,389.—REEL SUPPORT—F. S. Reeger, Germentown, Cal.

483,312.—CONTINUOUS FILR OR INDEX—A. J. Rudolph, S. F.

484,313.—LIBEAAY CATALOGUE—A.J. Rudolph, S. F.

483,173.—FLOOA SCAAPRA—F. C. Schroeder, Alameda, Cal.

The following brief list by telegraph, for Oct. 4, will appear more complete on receipt of mail advices:

Oscar W. Beach, South Riverside, Cal., vehicle axle; Harry J. Bennett, San Francisco, broom guard; Joseph R. S. Birch, San Diego, cigar lighter; Adam E. Chodzko, san Francisco, rock drilling machinery; Edward Ferris, Alta, Cal., machine for reducing the brasses of journals; Amasa P. Flaglor, San Francisco, device for modifying and controlling the rays of light for photographic purposes; Horace H. Fisk, Florence, Or., barrel stand; John H. McDade, San Frandisco, coin operated opera glass receptacle; Albert Minnlnck, Colton, Cal., ventilating device for railway cars; James W. Mollere, San Francisco, electro-therapeutical instrument; William G. Murphy Jr., Marysville, Cal., electric railway; Walter B. Noyes, San Francisco, folding bed; William A. Peters, San Francisco, apparatus for making malt; George W. Scott, Santa Rosa, Cal., hinge-seat cutter; Charles Smart, San Francisco, sanitary seal for covers of toilet vessels; Stephen F. Tuver, Puyallup, Wash., window shade supporter; Henry Vayre, San Francisco, awning; Charles Vogel, San Anselmo, Cal., grip for cable railways, two patents; Russell Whitman, Oakland, harness saddle pad.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TRAVELING HARVESTER.—Benjamin Holt, Stockton. No. 483,449. Dated Sept. 27, 1892. The invention in this apperetus designed to cnt, thrash, clean end sack grain consists in so constructing it as to enable it to travel upon sidehills and maintain the body of the thrashing and cleaning machine in a horizontal position and the wheels in a vertical position at all times whatever may be the inclination or variation of inclination of the ground npon which the mechine is working. The object is to enable a traveling harvester and thrasher to be used upon sidehills of any description and maintain the frame of the thrasher and cleaner at all times in a horizontal position and at the same time meintain the bearing-wheels in a vertical plane. It has also for its object the application of a suitable simple mechanism by which the position of the bearing-wheels reletive to the frame may be changed to suit the varying declivities over which the machine will pass.

AXLE-LUBRIOATOA.—John Q. Finch, S. F., assignor of one-third to A. W. Sanborn. No. 482,918. Dated Sept. 20, 1892. This device, which the inventor terms "a car-axle and bearing lubricator," is especially adapted to bearings where the weight rests upon the horizontel rotating shaft or axle, es in the case of cer-axles. The object is to supply the lubricant to the journal while the latter is in motion, and to have the feed cease when the journal ceases its motion. The inventor employs one or more coils or spirals, made of fine wire twisted into a small cord or etrand, this cord being then wound into the form of a spiral. This spiral is placed in the oil-box beneath the axle. The upper end of the spiral or cord is kept in contact with the lower part of the revolving axle or journal by the elasticity of the spiral pressing it upward. The effect of this is to agitete end cause a slight vibration of the spiral while the journal is in motion. The inventor says: "Practice has shown that with this motion a certain amount of the lubricsnt will be carried up partially hy capillary attraction, perhaps, and supplied in small quentities to the moving journal. As soon, however, es the journal ceases to move, the supply of oil ceases, and while I am not able, scientifically, to explain the operation of the device, the fact remeins, and the result is to feed the lubricant when the parts are in motion and to cease feeding when the parts stop, in which respect it differs from ordinary wicking or fibrous material, which feeds hy capillary attraction and feeds all the time, whether the journal he in motion or not. The device will not take up any dirt or foreign matter which is in the oil and thus become clogged and need cleaning, and hy reason of its rigidity and elasticity the upper end is kept in constant and yielding contact with the part to he lubricated."

FUMIOATOR.—Ferdinend A. Hoffman, Byron, Contra Costa Co. (Clara E. Hoffman, administratrix of said F. A. Hoffman, deceased). No. 483,484. Dated Sept. 27, 1892. This is one of that class of devices for exterminating small hurrowing animals, like gophers and groundsquirrels, and in which means are provided for generating end forcing noxious fumes end vapors into the holes. The object of the invention is to provide an exterminator of this class in which the fumes or vapors shall be generated freely and shall mingle with and load the air forced through them, whereby they are carried down into the holes or hurrows of the animels.

GRIP PULLEY.—A. S. Hallidie, S. F. No. 483,442. Dated Sept. 27, 1892. This invention relates to that class of pulleys known as "grip pulleys," and it consists of an improvement in construction hy which greater efficiency end portebility are obtained. The object of the invention is to construct the pulley of parts which can be separated so as to reduce a large pulley to small packages for transportation on mulehack or otherwise, which is necessary in mountainous localities where these gulleys ere frequently used.

New Incorporations.

The following companies have heen incorporated, and papers filed in the office of the Superior Conrt, Department 10, San Francisco:

WEST SHORE LANN CO. Capital stock, $50,000. Directors—Hermenn Zedig, Edward K. Chapmen, William Nicol, D. P. Belknap, S. Eppstein.

UNION LITHOGRAPH Co. Capital stock, $51,000. Directors—J. C. Hall, S. H. Strife, William W. Carter, E. M. Hall, W. K. Smith.

THE S. F. WREKS Co. Capital stock, $100,000. Directors—S. F. Weeks, James R. Watson, Albert B. Emerson, S. F. Weeks, Jr., end Joseph C. Cæsar.

CALIFORNIA KINDERGARTEN TRAINING SCHOOL. Capital stock, $1000. Directors—Nora A. Smith, Helen E. Bradhury, Mary P. Light, Kate Donglas Wiggin, Horatio Stebbins.

RIVEESIDE, SAN BERNARDINO AND LOS ANGELES R. R. Co. Capital stock, $2,000,000. Directors—D. S. Dorn, Samuel Miller, hoth of this city; M. H. Sherman of Arizona, R. J. Davis of Alameda. The object is to build a standard-gauge road on the following route: Commencing et the Morengo pass, near the city of San Bernardino; thence to Colton; thence to Riverside and thence by a route not yet selected to Los Angeles.

WOONY CONS. M. & M. Co. (Denver). To mine in Pitkin Co., Col. Capital stock, $2,000,000. Directors—J. J. Yeckel, B. D. Spencer, E. C. Simpson, J. J. Engelbarts and J. G. Fleming.

BULL HILL MINING Co. (Denver). Capital stock, $1,000,000. Directors—J. S. Johnston, A. S. Tyler, A. G. Chalmers, M. W. Smith, W. D. Combs, G. W. Dickinson and G. G. Shaver.

Market Reports.

Local Markets.

SAN FRANCISCO, Oct. 6, 1892.

General trade the past week has been only moderately fair for the season of the year. Trade continues to be dominated by a spirit of conservatism and from this well-beaten path large, and as for that, small dealers also, do not depart unless under exceptional inducements. The general tenor of information is of a very favorable character, and that confidence is developing in several branches of trade. Eastern mail advices are more favorable for an enlarging demand and improvement in several branches of trade. The improvement which is setting in appears to be more the result of a legitimate demand than of a speculative character, and therefore it will be apt to develop into larger proportions. The first decided improvement was noticed with woolen manufactures, and now the iron industry is falling into line. All leading and shrewd financial and commercial men accept the iron industry as a barometer to trade.

The local money market is reported quite active, with no trouble met in placing funds at 6 per cent. The demand for money is chiefly from mercantile circles and also for advances on warehoused grain. So far as we are able to learn, there is an absence of a demand for speculative purposes, it being with few exceptions for legitimate trade purposes. Remittances from the country are only fair, but with a further improvement in the market for wheat, considerable sums which are now tied up in that cereal will be unlocked and find their way back to the general reservoir. The decision of the U. S. Circuit Court in favor of hydraulic-mining, when the debris can be safely impounded, is accepted with much satisfaction, and gives promise to that greatly-abused industry forging ahead in the near future. With the rehabilitation of the industry, mining will again come to the front in this State.

Eastern mail advices continue to report an active money market with a free demand for funds from the central and southern States. The improvement in the market value for both cotton and wheat, with woolen manufacturers running on full time, and pig iron stiffening, is a more favorable outlook for the future than there has been at any time within the past three years. New York exchanges say the bank statements show a decrease in loans which are regarded by some as indicating a contraction of general business. This brought out the explanation that foreign bankers had taken advantage of the advance in the rates for money, particularly on time, by selling sterling bills short, or practically for the account of their foreign correspondent, and loaning the proceeds in the New York market. In this way a large amount of foreign capital, popularly estimated at from $8 000,000 to $10 000,000, had been loaned to those who had previously been borrowing of the banks.

The International Monetary Conference continues to attract attention, and, now that the conference has been called to meet at Brussels on November 22d, the interest will increase. The conference which met a few years ago did not attract such deep and widespread interest as does this. In consequence of this interest, the silver problem has met with a freer and fuller discussion, pro and con, than ever before. Under this discussion, it looks very much as if bimetallism had been strengthened. There can be no doubt but general trade stagnation the world over, combined with failures in the gold-standard countries, has materially assisted in promoting a better understanding of the financial situation and given strength to the movement for remonetizing silver. A Washington telegram says that the Powers which will be represented are Austria, Hungary, Belgium, Denmark, France, Germany, Great Britain, Greece, Italy, Netherlands, Portugal, Roumania, Russia, Servia, Spain, Sweden Norway and Switzerland. The delegates from the United States are Senators Allison and Jones, Congressman McCreery, Henry W. Cannon of New York and F. A. Walker of Massachusetts. It is expected Minister Terrill at Brussels will be made a delegate. The *Journal of Finance's* cab'egram from London says: "The Director of the Bank of England says there is certain to be consequential results for the whole world growing out of the coming monetary conference. This same authority avers that England and the United States will stand together in favor of the monetzation scheme for silver, which will give a largely increased volume of currency under conditions which will guarantee safety. It is rumored there are very marked differences of opinion touching the matter in Bank of England circles."

SILVER—The market has made a slight advance with a seemingly strong tone at the close. The strength of the market appears to be the natural result of a growing scarcity of the metal, which fact is being forcibly brought out by the prominence given to the discussion of bimetallism as the time draws near for the meeting of the monetary conference. Another factor is also contributing to the strength of the market, viz., a gradual improvement in several branches of trade at home and abroad and multiplying signs of returning confidence. With renewed activity in general trade the world over, a return of confidence and greater tendency toward speculation, it will most unquestionably be found that the gold standard will not meet the world's requirements, owing to the small supply of gold compared with the volume of trade and metallic-money requirements in more active times. Advices continue to come to hand of silver mines shutting down.

MEXICAN DOLLARS—The market appears to have a stronger tone, in sympathy with silver, at around 67¼ cts.

QUICKSILVER—Receipts the past week aggregate 401 flasks by coast, rail and 150 flasks of domestic reshipped from Sydney. The exports by sea aggregated 144 flasks to Mexico. The market is easy at a shading in prices. It is said that some outside parcels are obtainable at concessions on trust prices.

LIME—Receipts the past week aggregate 3771 bbls. The market is irregular at $1.25@1.50 per bbl. The demand is reported as only fair.

ANTIMONY—The market continues to rule in buyers' favor. New York mail advices quote as follows: 10c for Hallett's, 11c for LX, 11¼c for Crown and 11¾@12c for Cookson's in round parcels.

PIG LEAD—The market is barely steady. Eastern mail advices report a fairly active market for pig at 4 cts in New York for round parcels, but at over $4.05 per 100 lbs, buyers do not take hold.

PIG TIN—Imports the past week aggregate 654 pigs from Australia. Our market continues to rule steady, with supplies well in hand. The demand is good for the season. The strengthening of silver has slightly improved pig tin abroad; with further advances in silver, it is thought that tin will also appreciate. Tin plate is easy and inactive.

PIG IRON—The low price ($19 to $20 per ton) at which American is put on this market operates very materially against the foreign product. The consumption, outside of shipbuilding and for railroad purposes, is said to be light. Eastern mail advices report that the markets are working into better shape for the selling interest. The advance of 25 cents by southern ironmakers had restricted orders, but it is thought that this is only temporary and would be followed by heavy purchases.

COPPER—Exports the past week aggregate 110,755 pounds of matte to New York. The markets abroad and at the East have advanced under a freer demand and stronger bolding. At present very little confidence is placed in the advance.

COAL—Imports the past week aggregate as follows: Cardiff, 8834 tons; Coos Bay, 450; Tacoma, 7106; Departure Bay, 3408; Newcastle, N. S. W., 3760; Baltimore, $3000; total, 26,558 tons. The market is reported stronger at an advance of about 25 cents per ton for the foreign on spot and to arrive. It is reported that about all the foreign coal on the way cared for, gives a better tone to the market, which is strengthened still further by the strong tone of the freight markets abroad.

San Francisco Metal and Coal Market.

Eastern Metal Markets.

NEW YORK, Oct. 5.—The following are the closing prices the past week:

	Silver in Londom	Silver in New York.	Copper.	Lead.	Tin.
Thursday	38¼	83¼	10 90	4 00	20 25
Friday	38¼	83	10 20	4 00	20 35
Saturday	38¼	83	10 90	4 00	20 40
Monday	38¼	83	11 05	4 00	20 45
Tuesday	38 3-16	83¼	11 15	4 00	20 30
Wednesday	38¼	83¾	11 15	4 00	20 30

The market is easy at lower prices for quicksilver, in sympathy with a decline abroad. Borax is strong, with a good demand reported. Pig tin is steady. Copper is stronger at a slight advance. Lead is fairly steady.

Mining Share Market.

SAN FRANCISCO, Oct. 6, 1892.

Mining shares the past week were active at declining prices up to Monday, when a steadier tone set in, which has since been followed by firmer prices, with the upmove chiefly in the north-end shares, under the lead of Con. Virginia. On last Saturday there was a decided break with Belcher, after the regular call selling down to $2.60 per share, against sales on Tuesday, Sept. 27th, at $6 50. Other south-end shares suffered proportionately. The drop ended with the usual result—uncovering of margins and heavy financial losses to bulls, but patrons of the PRESS who heeded our remarks in the issue of Sept. 5th—at which date Belcher shares were selling at around $1—made money. The remarks then made will bear reproduction, for they apply with equal force now that they did at that time. We then said: "The lessons of the past have made it a certainty that when a sufficient number of gudgeons buy on promises which are as unlikely to prove true as that a pot of gold will be found at the end of the rainbow, they will find it is a down market, with assessments until the outside is frozen out and the rings get the shares for a great deal less than the collected assessments aggregate. It is time enough for the public to take a hand at the game when there is a prospect of the mines being worked and the ore milled according to the laws under which the companies incorporated. The inside ostrich trick of hiding the head while exposing the body, does not deceive, and until they put others to the front, as relormers, than those who have been closely connected with the rings, the public bad better keep a close eye to the windward. The writer will place bimself on record, as he has repeatedly done, on the upmoves made within the past five years, by affirming that when the rings have peddled out a sufficient number of shares, there will follow the usual low range of values—60 to 80 per cent below the highest figures reached. Of course, the old stale cry of big bonanzas and something big near at hand in the share market will be the allurements to keep gudgeons, when in the net, from pocketing what loss or profit, as the case may be, they have met, and not take the certainty of heavy losses. While raising a warning cry at this early day against the game as now theivingly carried on, yet the writer thinks that the ring will have to send the market somewbat bigber before it can induce gudgeons, through their cappers and paid newspaper writers, to load up."

Time proved the correctness of the above prediction, and time will again prove that the present upmove, which we appear to have entered on, will be more disastrous to the bull interests than has followed any upmove since 1887. What tactics insiders will adopt to get the public to load up, the writer does not pretend to know, but that they have some kind of a devilish game concocted goes without saying. Owing to our early warning regarding the last upmove, the rings did not succeed in accomplishing that which it looked as if they attempted, for although a number of outsiders were caught on the bull side, yet the majority not only sold the stock they were long on, but shorted the market and came out big winners. It now looks as if the outsider who keeps cool and does not fear that the market will go skyward, will again have an opportunity of making money by selling; but this time it will probably be more difficult than ever to resist the temptation of buying and holding shares.

Everything now indicates that the inside wants to put out one or more lines of assessments this winter, which they want outsiders to pay on the usual rainbow promises of dividends and big things in the sweet by-and-by.

Our advices from Virginia report that H. M. Levy had arrived on the Comstock lode. It is said that his arrival and also that of J. L. Flood, had given rise to reports that they were in Virginia to look after the reported stealings from the milling of Savage ore. It is said that Mr. Levy is as much interested in the Comstock mines as ever before, but not now openly. It is a great game, this, of working the Comstock mines.

If the directors of the Savage Mining Co. desire to free themselves from even the suspicion of collusion with the mill rings, they will either buy or lease a mill or let the contract for milling the ore to the person who made so favorable an offer. The person is entirely responsible and would return the bullion to the Company for dividends, instead of, as report says is now done, to a mill ring or rings for dividing among the members.

The Quijotoa companies have lately been collecting assessments, and it seems as if Mr. Lyle, president of several of them, could not resist the temptation of visiting the mines. The only result the writer can see that has come from former visits of Mr. Lyle to the mines, has been the decreasing of the money collected for assessments. It is said that Mr. Wells, the reformer, is the legal adviser for the Quijotoa companies.

The share market this (Thursday) morning opened inactive, but with a firm tone. After regular Call, the market was irregular but its general action indicated that Bob Morrow's brokers were taking in shares. Whether the buying is preliminary for an upmove it is hard to say, but it looks as if it is, but for how much each reader must be the judge.

Con Virginia's bullion output in last month aggregated over $78,000. There was a large increase in the percentage of gold.

News from the Comstock mines is to the effect that in the Gold Hill group more men are to be put to work. It is also said that enough water will soon be flowing down the Carson river to admit of starting up the mills on ore which has accumulated in several of the mines. It is said that while in Virginia J. L. Flood instructed the superintendent of the Con. Virginia mine to increase the ore assays. It is a great game this, of working the Comstock mines, provided the above is correct, by orders from Pine street. The last official letter from Belcher reports the starting of new work and more favorable indications encountered. In Overman, the work is quite important, as it is in Kentuck, Crown Point, Jacket and other Gold Hill mines, but much of it is still kept back. Perhaps this is done to induce buying when made public later on. What outsiders will get out of the bullion from any of these mines, under the present milling system, is not likely to stay a hungry stomach, let alone putting any money in the purse. The work under way in Hale & Norcross is being closely watched, as is that in several of the north-end mines. Probably the watching is all that will come out of it. There is no doubt but several of the mines can be worked so as to pay dividends, but it looks as if they will not until more rigid measures are brought to bear against the demurring directors to have the mines worked and ore milled for the benefit of outsiders as well. It is now said to be done for inside rings.

A Successful Concentrating Belt.

It will be seen by the new "ad." of the Blasdel Concentrating Belt Co. that they are now manufacturing, in addition to their riffled belts, smooth ones with their Blasdel Patent Flanges. These patent flanges have already demonstrated their many advantages over the edges heretofore used on concentrating belts, as they conform to the change of direction in passing over the end rollers without breaking; thus they avoid the nuisance of frequent stoppage of machines to repair the flanges. One can only wonder why a device so simple, yet so efficient, has not been invented before. The company are now arranging to introduce their belts in all the mineral States and Territories. Further particulars may be had by addressing H. G. Blasdel, Jr., Manager, No. 419 California St., San Francisco.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

DELINQUENT SALE NOTICE.

KEYSTONE CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of Works, Amador City, Amador County, California.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 3) levied on the 22d day of August, 1892, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
John S. Hager	11	233	$233 00
John S. Hager	130	100	100 00
M. J. McDonald	137	500	500 00
E. D. Rue, Trustee	138	926	9 6 00

And in accordance with law, and an order of the Board of Directors, made on the 22d day of August, 1892, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, 310 Pine St., Room 43, San Francisco, California, on TUESDAY, the 18th day of October, 1892, at the hour of 12 o'clock M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

J. H. ISHAM, Secretary.

Office, 310 Pine St., room 43, San Francisco, Cal.

The Evans Assay Office and Chemical Laboratory.

628 MONTGOMERY ST., San Francisco.
ROOMS 46 and 47 MONTGOMERY BLOCK.

Ore Assays, Analyses of Minerals, Waters, etc., made. Lessons given in Assaying and Chemistry.

W. N. JEHU, Manager.

DIVIDEND NOTICE.

OFFICE OF THE PACIFIC COAST BORAX COMPANY, San Francisco, Sept. 30, 1892. At a meeting of the Board of Directors of the above-named Company, held this day, a Dividend (No. 22) of One Dollar ($1.00) per share was declared, payable MONDAY, October 16, 1892, at the office of the company, No. 101 Sansome Street, Room 26. Transfer books will close October 5, 1892, at 3 o'clock, P. M.

ALTON H. CLOUGH, Secretary.

Undeveloped Prospects Not Salable.

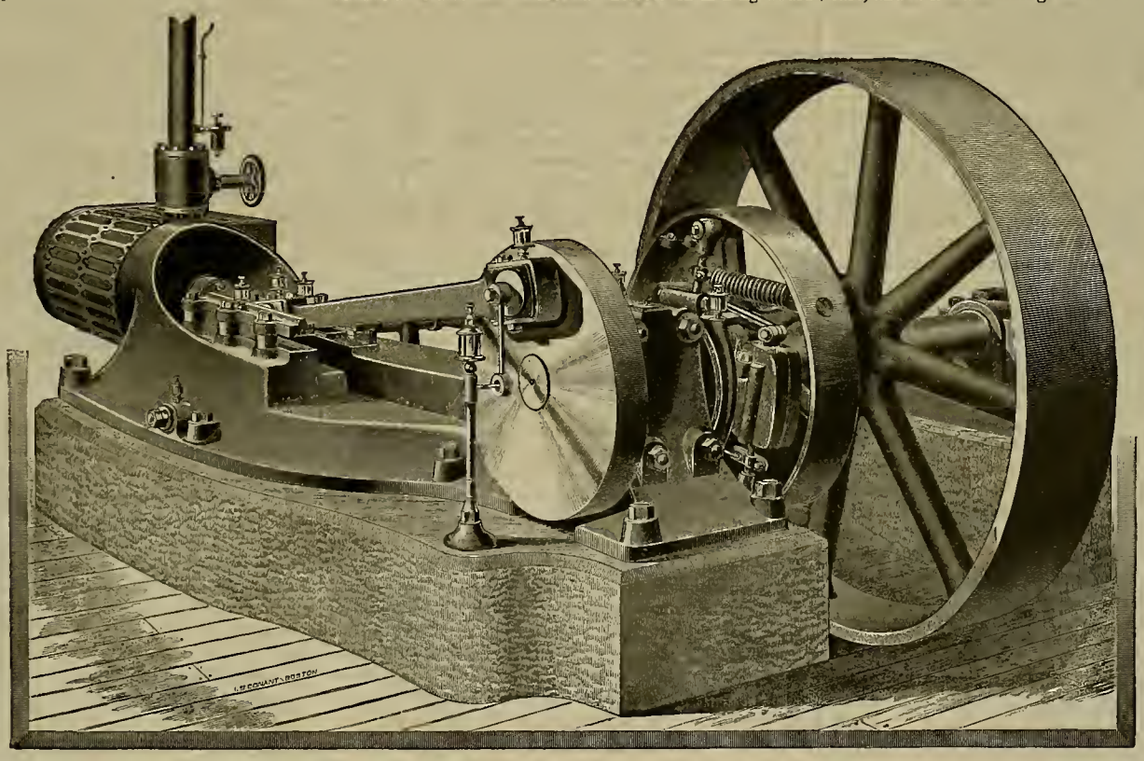
In glancing over our exchanges we frequently see mention of new strikes in old mines and claims that have been suffered to lie idle for years, when taken hold of by some man on a possibility that they may prove of value. Some of our best paying mines are those that bave been suffered to lie idle for want of faith in them or want of capital to carry the work to a point to determine their value. There are hundreds of such claims all over the State that the owners have suffered to go by default or doing only sufficient work to comply with the law, thereby enabling them to be held; the owners continuing to hold them in the hope that some man with money may come along and purchase. Thus these undeveloped claims are held from year to year for the purchaser that never comes. This is a mistaken policy as purchasers are not likely to see sufficient development to justify giving attention to what might with a few months work by the owner open up a claim to a point to determine the question of its future possibilities. It is a mistaken idea that a purchaser can be found willing to take all the chances and risk, whereas a certain amount of work might show some prospective value which can never be determined as long as the claim is suffered to lie idle.

The owner himself is equally ignorant of the value of his claim and is often doubtful whether it has any real value. He is not likely to meet with any experienced miner or capitalist having any greater faith in the soslightly developed property than he has himself; hence the only way to settle the question for his own satisfaction and put it in marketable shape is to do the necessary work to determine whether it is worth doing assessment work.

We believe that if the owners of mining claims and prospects, instead of waiting for some thing to turn up or the purchaser who never comes, would go to work earnestly to develop their prospects we should have more instances of old and abandoned claims coming to the front. There are probably as many good mines at present valueless for want of such development unknown and unheralded as are now in profitable operation all of which were in this condition of doubt and uncertainty until such labor as we recommend was done upon them.

The complaint of the general dullness and apathy in the old mining districts is as much the fault of the miners owning claims as the indifference of capitalists. In fact it is an error to say that the capitalists are indifferent for at this moment there is an abundance of capital awaiting investment in mines, but the proposed investor cannot be induced to take up a property in its undeveloped condition.

In urging upon owners of mines we do not advocate the outlay of capital beyond the actual labor of their own hands which is all sufficient to soon determine whether it would be justifiable to hire additional labor. There is sufficient idle capital at present in this city to invest in mines showing a prospect of future value to justify every miner having a claim which he believes only needs development to be valuable to go to work on it with an almost certain chance of finding a purchaser. It will be found that purchasers are more numerous than is at present supposed, but such investors will not assume the initiative and do the preliminary work; that tbe miner and owner must do if he ever expects to realize a dollar for his claim. We believe an era of most successful interest in mining would be inaugurated if this suggestion was adopted and there would be no more complaints of apathy on the part of capitalists in mining investments. It is difficult for the capitalist here at the present time to realize more than 6 per cent for his money. He will be glad to invest his capital in mines that will pay him 10 or 15 per cent per annum. It is the miners part now to furnish him the mine; hence we say again to the miners go to work and develop your claims.



GIDDING'S AUTOMATIC CUT-OFF ENGINE, PORTER TYPE OF BED.

THE Witwatersrand (South Africa) gold output for August is reported at 102,322 ounces, as against 59,070 ounces in 1890. This product, while a gain of 1042 ounces on the July output, is a loss of 678 ounces on the June output. The output for the eight months ending with August aggregated 705,747 ounces, as against 437 114 ounces in 1891 for the like period, or a gain of 61½ per cent. The estimated value of the eight months' output is $13,209,136.

THERE is great excitement in Valparaiso over the reported discovery of heavy placers of gold on an island in the Terra del Fuego.

High-Speed Automatic Cut-Off Engines.

In the Giddings medium, high-speed automatic cut-off engines made in Sioux city, Iowa, and for which the Park & Lacy Co., of this city, are coast agents, one of the principal features is the "equilibrium" slide valve. This valve consists of one piece, takes steam from underneath, supplies the cylinder through double ports, giving twice the usual port area, and close approximation to boiler pressure. Is self-adjusting to wear and position, and free to lift from its seat, sufficient to relieve the cylinder of water. Equilibrium is obtained by two needle ports in brass plugs in the top-edge of valve, one supplying live steam to the back of valve to avoid lifting, another connecting with exhaust passage, thereby preventing accumulation of pressure, and still maintaining about two pounds of surplus pressure per square inch on back of the valve, which insures a positive and permanent tight joint. The connection is made by a hinge joint whereby the valve can be opened outward like a door without disconnecting.

The Giddings automatic cut-off governor, while similar in general appearance, possesses several advantages over other shaft governors, having a greater degree of stability, and capable of the closest regulation. Its construction consists of two eccentrics; the auxiliary eccentric rotating on the hub of the governor disc by the usual system of weight-arms and levers. This eccentric has a cross-head strap which gives a motion square across the shaft, preserving a constant lead. The main eccentric fits over this cross-head by means of lugs, and its throw is varied hy the movements of the same, thereby changing the travel of the valve to give the required port opening for varying loads and boiler pressures, at the same time preserving an *absolute* uniformity of motion. This combination of two eccentrics gives the greatest possible degree of stability, as it is mechanically locked in every position.

In design, these engines possess a great degree of stiffness and rigidity, insuring perfect alignment, and consequent light-running, and by reason of the valve used, they are economical engines. Nothing hut the best of material is used, and the workmanship is excellent.

CLARENCE L. COLEY has been appointed assistant professor in the department of mechanics at the University of California at a salary of $2000 for one year.

SOUTH MOUNTAIN will be one of the leading camps of Idaho when it has railroad communication.

Comment.

The establishment of a trading station on the upper Yukon river, Alaska, is an important thing for the miners and is the cause of many remaining this winter at their claims instead of returning home as usual. The high price of provisions in inland Alaska during winter has been a great drawback to the mining industry. Flour used to cost $15 to $18 a sack and nothing less than $10 a day diggings were worth bothering with. Chicago capitalists recently organized a company for opening placer fields on the upper Yukon and they have established a trading station at Upper Ramparts, 2000 miles from the mouth of the river. Flour will be sold at $3 per sack and other things in proportion. The comparatively low prices have induced many miners to remain at their claims for the winter, saving the long trip back to the coast. The company which has established this new station has taken improved machinery in to work its own mines. It will send in next spring about $15,000 worth of machinery and provisions. Several hundred men will also be sent into the various mining claims owned by the company, which is known as the North American Transportation and Trading Co.

CHAS T. YERKES, the street-railway magnate, proposes to give to the Chicago University the largest telescope in the world—larger than the Lick, in this State. Alvan G Clark has, it is said, undertaken to make a 45-inch glass. The Lick is a 36-inch aperture refractor, and Clark has since made a 40-inch glass. These large glasses can be made now much cheaper than when that for the Lick telescope was cast. Mr. Yerkes expects to get his telescope for $500,000. The Lick Observatory cost $700,000, including the buildings. It will take several years to cast, grind, polish and finish the proposed glass, and it is not likely that it will, when finished and set up at Chicago, be able to accomplish the work the Lick does here. The atmospheric conditions at Chicago are very unfavorable for astronomical work. A large body of water at one side of an observatory is a great detriment in the first place, and the atmosphere of a great city is still worse. Chicago is, however, a city of big things, and the largest telescope in the world would be a first-rate advertisement, even if no specially startling results were accomplished with it.

Judge Hebbard has denied a motion for a new trial in the famous case of M. W. Fox vs. the Hale & Norcross Silver Mining Co. et al. In his opinion the court states its position as regards the defendants very clearly. He speaks of the defendants by name, and says that with the single exception of H. M. Levy, he does not believe that any one of these directors ever received a dollar's worth in value of the property diverted from the company. With the single exception of Mr. Levy, he believes they would have scorned a division of the spoils of the conspiracy in any amount whatever. "But," continues the court, "I am thoroughly satisfied that these same directors, by their gross carelessness and negligence, by the violation of the trust reposed in them by the stockholders of the company, and by the violation of the duty imposed upon them by law, allowed and permitted the other defendants to misappropriate the property of the corporation." No one not interested can well find fault with this decision. If these directors, by ignorance or negligence, levied unconscionable assessments and confirmed dishonest contracts of conspiring employes, by which the stockholders were robbed, they ought to be held responsible. This should have a salutary effect on changing the habits and customs of mining-company directors. They will be more careful in the future and find out exactly what they are doing at their meetings. The decision should also clear the moral atmosphere of the mining-stock dealings and give investors a better chance than they have had to get returns for their money.

The Bay and the Mines.

The San Francisco *Bulletin* does not think Judge Gilbert's decision in the North Bloomfield case will satisfy San Francisco, because the fine clay held in solution has been deposited in Suisun, San Pablo and San Francisco bays, north of this city. It confesses the channel has kept at mid-depth pretty well, but it has been narrowed and the bays filled up on either side, a process which will go on and decrease the tidal scour and eventually shoal the bar at the harbor mouth, damaging San Francisco bay. This is mere surmise on the *Bulletin's* part, because there is no evidence that the bar has shoaled at all, or that it will. As far as San Francisco being satisfied is concerned, this city has done as much filling of the bay as the miners have. There has been a constant mania for filling in. They first filled in Yerba Buena cove, the natural harbor of the city. They then filled in Mission bay, a large, fine cove, eminently adapted for shipping purposes of a great city; a place where ship and car could have come together. They are now filling in Islais creek cove or bay, the third of the three great indentations on the San Francisco peninsula. In front of the city proper, they shoved the seawall way out and filled behind that. Then the cove behind Black Point was filled in. Beyond, and extending to Fort Point, they are now filling in. The sandhills of the entire city have been dumped into the bay, a process which has been going on for 30 years, and still continues. For the people of this city to remonstrate against others dumping into the bay, after what they have done themselves, is laughable. There are no coves left for shelter from Fort Point to Hunter's Point. Every one has been spoiled. As a result, ships go to Port Costa, Martinez, Oakland and Saucelito, instead of laying-up here. This is all due to the filling-in process, which has destroyed the natural shelters. If decreasing the tidal scour is bad, San Francisco has done most of it thus far. As to the upper bays, north of the city, there never were any cities or towns along the shallow part of their shores. Wide flats extended out from the shores when this country was first settled, before mining commenced. The middle ground of Suisun bay existed then, as now. The flats have shoaled somewhat since then, and, as the *Bulletin* asserts, have widened, narrowing the main channels. But the Government spent some millions in narrowing just such channels at the mouth of the Mississippi, in order to deepen them. The same result has been accomplished here, at a profit; that is, working the mines and depositing the silt, narrowed and deepened the channels in the main San Pablo bay, the first northerly arm of San Francisco bay, and the most important, leading, as it does, to Mare Island Navy Yard and Port Costa. Thorough investigation of this subject, 10 years or more ago, by the Board of Trade of Vallejo, proved these facts.

There is a great deal of nonsense talked about the shoaling of the bay by people not familiar with it. There is a wide channel each side of Southamptoo shoal which lies between Raccoon straits and Red Rock, and which existed in 1849, before mining commenced. The shoal is no larger than it was then. But the Presidio shoal, off the north city front and extending down toward the Gate, has shoaled and enlarged. This shows that the decrease of tidal scour resulting from the filling operation around San Francisco has had an effect, since the waters from the south side of the bay flow down that channel. The waters from the main rivers of the State, where the mining comes down, flow to the sea, past Southampton shoals, through Raccoon straits and that part of the bay north of Alcatraz Island. Therefore, the shoaling of the lower bay is due more to the senseless filling in for 25-foot lots, than it is to mining operations, and in thus filling in, the bay, as a shelter for vessels, has been spoiled. The famous seawall as a place for discharging and loading vessels is first rate; but as a protection there is valueless. It is worse; it is a danger. The seawall to the north of the city is a dangerous place during northers; and southeasters will make the southern seawall bad when built. The Pacific Mail Steamship Co. has refused to move to the north seawall fearing to endanger its valuable steamships, and will move to Oakland rather than take the chances of a berth north of the city.

Nobody has said very much about this filling in of the coves about the peninsula, because it makes real estate which can be sold, and that makes business in San Francisco. But it is and has always been detrimental. Even now they are making these lots with garbage on Mission bay. All the filth of the city is dumped in. The stuff that flows from the sewers on the water front and sinks is dredged up and taken in barges to the anchorage in front of the city and there dumped. For 25 or 30 years these barges of the Harbor Commission have been daily dumping this mud and filth while keeping the wharf-slips deep. It all goes to the bottom of the bay and has helped extend the Presidio shoal.

And the *Bulletin* does not think Judge Gilbert's decision will satisfy San Francisco, because silt from the mines may shoal the bay. It has done no harm to navigation whatever. The mud flats were never used for anything—navigation nor building. The channels where the shipping goes have been deepened. Their width is of little moment, for in San Pablo bay the channel is a couple of miles wide even now. In the lower bays they remain the same.

If the State has any cause of complaint, it is against the city of San Francisco rather than mining or agricultural residents of the interior, although both have contributed to the material entering the lower bays. The bay south of the city has shoaled greatly in the last 40 years, but there are no mines there, and nothing but agricultural debris and natural brush enters it.

An immense area is drained by the Sacramento and San Joaquin rivers and their tributaries, and all this water must pass through the bay and Golden Gate to reach the sea. Nothing that man can do could stop this flow; it could not possibly be dammed back. And while the water flows it will cut channels to make its way. It is all foolishness to talk of the bay filling up. The bights between points are always shoal in any bay, though they are shoaler here than is usual. But the main channels remain as deep to-day as they were when the State was first settled by Americans, and the bar at the harbor mouth shows no radical change one way or another.

Comparative Cost of Carrying Passengers on Street Roads.

There is more or less discussion on the subject of comparative cost of carrying passengers on street railroads, by the different systems of power, the main rivalry being between cable and electric roads. One large city, at least, has an excellent opportunity of comparing practical results and that is Birmingham, England, where the Birmingham Central Tramways Co., limited, operates an extensive system. They own and operate steam roads, horse roads, cable roads and electric roads. A copy of the annual report of this company is at hand, and a perusal is of great interest. The directors say: "The subjoined statement of traffic and profit shows that the profits of the steam department have been naturally reduced by the charge for fuel and by repairs to engines. The electric department shows a loss, chiefly due to the heavy charges for renewal of batteries, but your directors now have under consideration a contract for maintenance of batteries which, it is hoped, will tend to material economy and profit of working. The cable department has again shown a gratifying result, and it is evident that upon miles of heavy traffic and severe gradients, no other system of traction at present in operation can compete with the steel rope."

An increase of revenue is desired, and to do this the company proposes to spend $300,000 in converting the Stratford-road line into a cable road.

We have not space for the complete report but will take such figures as illustrate the difference in cost of carrying passengers on the different systems. In the steam department the expenses, for engines, car repairs, traffic, permanent way and buildings, charges, etc., amount to $303,-859.41; passengers carried, 14,659,240. This makes a cost of 2.07 cents per passenger. Miles run, 1,212,624, which is 12.07 passengers to the mile run.

In the horse department the expenses were $131,681.89; passengers carried (both tramway and omnibus), 3,750,741. This makes the cost of carrying each passenger 3.50 cents. The miles run amounted to 634,551 and they carried 8.39 passengers per mile on the tramways and 5.25 passengers per mile on the omnibuses.

In the cable department the expenses for haulage,

cables, repairs, traffic, permanent way and buildings, general charges, etc, amounted to $80,003.12; passengers carried, 5,922 304; cost per passenger, 1 35 cents; miles run, 621,210; passeogers carried per mile, 9,53.

In the electric-road department the expenses for electric haulage, machinery, repairs, traffic, permanent way and buildings, general charges, etc., amounted to $60,508,91; passengers carried, 1,382,997; cost of carrying each passenger, 4 37 cents; miles run, 188,760; passengers carried per mile, 7.32.

These figures are from the official report of the company to the shareholders. They are not mere theory, but are based on the actual work of the year. According to these, the cost of carrying each passenger on each style of road is as follows:

	Cents.
Steam	2.07
Horse	3.50
Cable	1 35
Electricity	1 37

It must be admitted that this company has exceptional facilities for comparing the systems, since it has all four in use. The results speak for themselves, and will be read with interest by all street-railroad men.

Coast Industrial Notes.

THE Petaluma silk factory buildings have been completed.

THE bids for supplying the San Bernardino Insane Asylum with machinery and electrical apparatus were all rejected and will be readvertised.

MINING assessments falling delinquent this month amount to $109 000, of which Nevada mines want $55,500, California $28,500 and Arizona $25,000.

THE force at the Mare Island Navy Yard has been reduced something like a hundred men during the past two weeks, there being now but about 530 on the rolls.

THE Spreckels Brothers have expended about $400,000 on electric railways in San Diego, the system being 12 miles long. They now desire to build another branch on D. street, which will cost some $50,000 more.

THREE thousand two hundred and four acres have been subscribed to the Cooperative Sugar Factory at Anaheim. Deeds to 1700 acres have been handed into the corporation, and now the work of putting up the factory will begin.

THE Hueneme *Herald* says: Well No. 2 of the Sisar Oil Company is producing a large amount of gas, and there is every indication that it will soon yield a good supply of oil. The stock in this company is owned principally in Hueneme.

N. E. SAGER, of Redding, is in the city closing up a deal for $300,000 worth of Mendocino county timber lands. The purchasers are Chicago capitalists, who will probably put in some extensive sawmill plants to furnish redwood lumber for the Eastern markets.

THE large saw and shingle mill of Bothell Brothers, at Bothell, Wash., was burned on Saturday. Several hundred thousand shingles were also burned. The capacity of the mill had just been doubled. It employed 50 men and cut 100,000 shingles a day.

THE bids submitted for a large amount of dredging for the improvement of Olympia harbor and Swinomish slough were opened by Captain Symons, United States Engineer, at Portland, Or., last Saturday. The lowest bid was made by Gieger & Zabriskie of California, who propose to do the work at Olympia for 13 cents per cubic yard and at Swinomish for 16 cents per cubic yard. They operate a Hercules dredge.

THE Board of Trustees of Sacramento have granted a franchise to H. P. Livermore and Albert Gallatin of San Francisco to construct and operate an electric railway through the principal streets. Power is to be furnished from works at the State Prison at Folsom, a dam for which has been built in the American river at that place. The board also passed a franchise granting them the right to bring into Sacramento City by wire electric energy from the Folsom dam for lighting and motive-power purposes.

GRADING on the extension of the Metropolitan electric railway from First avenue and Carl street out I street to North avenue has been completed. Tracks have been laid as far as Fifth avenue, and but a short time will elapse until the road is finished to the terminus near the Olympic Club grounds. The Omnibus Cable Company has laid a 50-foot strip of double-track cable road on Carl street, between Willard and First avenues, sufficient to keep the terms of its franchise for a road out Carl street to First avenue..

THE San Francisco lumbermen interested in controlling the cargo output of the coast have prepared a schedule of the amount of lumber each mill may cut under the pool arrangement. The schedule is based upon the output of 1891, and is unsatisfactory to most of the small millowners, who may be subsidized, although it is not the plan now to subsidize mills. The new schedule, if made, may, instead of subsidizing, increase the output of small mills. It is held that $9 per 1000 can be secured just as readily as $7 per 1000, if the output can be controlled.

THE borax receipts in this market for September aggregated 242,900 pounds. The total receipts for the past nine months amounted to 1,276,909 pounds, as against 1,593,300 pounds in 1891, and 1,812,300 pounds for the same period in 1890. The returns of the exports in September have not yet been received, but in August they amounted to 1,057,994 pounds. The total exports for the past eight months amount to 8,955,013 pounds. In 1891, the exports for the first nine months of the year amounted to 9,327,003 pounds, as against 7,672,067 pounds in 1890.

Practical Work With the Cyanide Process at the Mercur Mill.

SALT LAKE CITY, UTAH, Oct. 7, 1892.

TO THE EDITOR:—On page 204 of your issue of September 24th inst., I find a report of a statement made by Prof. Morton at a meeting of the Shasta County Miners' Association, from which he seems to have fallen into error in regard to the working of the ores from the Mercur mine at the company's mill.

Because the representatives of the MacArthur-Forrest process, in Denver, stated in their report that it was the intention of this company to increase their capacity to 50 tons per day, he takes it for granted that they have done so and makes his deduction on that basis. This company, although it intends so to do in the close future, has not yet increased the mill capacity to 50 tons per day, and never has been in the habit of advertising its business, being satisfied with what is being done. Huwever, as a very wrong impression might prevail among mining and milling men, on reading a statement made by such a noted man as Prof. Morton, I deem it well, in justice to this compaoy and the MacArthur-Forrest process, to make the following statement:

The workings for the months of May, June, July and August were as follows:

	Tons del'd at M ll.	Battery Assay.	Tailings.	Net Extracted.	Per Cent.
May	880	$15.01	$2.67	$12.34	82
June	305	17.57	2 56	15.01	85½
July	402	17.50	2.85	14.65	82⅝
August	755	18.90	3 30	15.60	82⅝

By actual returns, per certificates received from the Omaha & Grant Smelting and Refining Co., and now in my possession, were as follows:

	Gold ozs.	Per oz.	Total Value.	Tons Milled.	Total Extracted.
May	413 74	$20.00	$ 8,274 80	880	$10.859.20
June	262.33	20.00	5,246.60	305	4.578.05
July	303.43	20.00	6,068.60	402	5,889.30
August	550.40	20.00	11,008.00	755	11,778.00
		Totals	$30,598.00	2342	$33.104.55
			Difference		$ 2,506.55

This difference is accounted for by gold still in solution and product left in the precipitating boxes, the result of ore put into tanks during August included in the tons milled; but as we do not make an absolute clean-up every month, there is always quite a lot of valuable product left over. The actual cost of mining and milling, including superintendency and royalty, is $5.60 per ton, so that 2342 tons worked cost $13 115.20, leaving a profit of $17,482.80, or $7.47 per ton.

This shows a net extraction of $13 07, or 77 per cent, by actual returns from the refinery. If a thorough clean-up had been made, this percentage would have been much higher.

The cost at present is excessive, as all the ore extracted and milled is obtained in development work, no stoping having been done thus far; consequently, as any miner will acknowledge, this class of work is the most expensive. By increasing the mill capacity to 50 tons the cost of milling will not be increased, as the same number of men as now employed can readily handle that quantity. When we get ready to stope, the cost of extracting the ore from the mine will be merely nominal. Yours respectfully,

R. L. SCANNELL,
Sec'y Mercur Gold Mining and Milling Co.
P. O. Box 870, Salt Lake City, Utah.

That White Powder.

SAN FRANCISCO, October 8, 1892.

TO THE EDITOR:—In view of the question recently raised by Mr. Aaron, as to whether the white powder formed from the contact of a cyanide solution with zinc might not be a source of loss, the following extract may be of interest. It is from a letter received by the writer from Mr. Gill S. Peyton, the manager of the Mercur mine.

"* * * We are not bothered at our mill (the Mercur) with this powder. At our Nevada plant we see the powder forming. I had some of it sent me, but only found a trace of gold in it, and made a test on the solution after it had passed through the zinc, and found only 80 cents a ton in it. * * *" C. W. MERRILL.

Personal.

DR. LUX and Mr. Wilbur have been visiting Downieville, Sierra County, on mining business.

R. G. HORN, the well-know stock broker and president of the Pacific Stock Exchange, has returned from Cincinnati.

HORACE D. RANLETT, the California coffee operator, is at present in New York, but will shortly return to San Francisco.

AT a special meeting of the directors of the Belcher Mining Company W. E Sharon was appointed assistant superintendent the mine.

CHRIS MALLON, Superintendent of the Delhi quartz mine, Nevada Co., says they are now putting in heavier machinery to handle the water, and cutting out a new station for the purpose of opening up a new level. The mine is looking finely.

W. PICKERING, of London, arrived in Tucson, A. T. last week. He is in the interest of the Canada Del Oro Mining Co. He is highly pleased with the outlook of the Canada Del Oro properties in Pima county. He states there is plenty of ore at the smelter, and the different mining claims show large bodies of good ore. Mr. Pickering proposes to become a permanent resident of Tucson.

Ancient Placers in the Land of the Incas.

Rehabilitating the Gold Fields of Ecuador.

SAN FRANCISCO, Oct. 8, 1892.

TO THE EDITOR:—Heretofore our California mining prospectors have shown themselves the pioneer explorers of the mineral regions situated on the Pacific slope of the continent. Until recently they had been the first to enter and open up all mining territory lying west of the Rocky mountains, and also of the great Andean Cordillera of South America; but, if reports may be credited, the New Yorkers have at last stolen a march on us, having some two years since secured in a quiet way title to an extensive tract of rich placer ground located in the Republic of Ecuador, South America; what makes this event the more noteworthy being the fact that this country has never been considered especially rich in the precious metals.

To Peru, its neighbor on the south, tradition has assigned a great wealth of both gold and silver, this having been the land of the Incas, whose immense store of these metals led to the speedy conquest of the country by the Spaniards, who, immediately they had obtained a foothold, proceeded to despoil these native princes of their treasures. So enormous was the plunder thus obtained by the cruel and ferocious Pizzaro and his followers that they sufficed to load many galleons sent home to Old Spain.

It does not appear that these freebooters secured any great amount of plunder in the country now known as Ecuador, and for the reason probably that the larger cities and the bulk of the population then, as now, were located in the distant interior, occupying the great valleys lying between the two principal ranges of the Andes. In one of these valleys, far from the coast and difficult of access, is situated Quito, the chief city and capital of the republic. That the ancient inhabitants of this region were not behind their neighbors in architectural or other kind of artistic skill is evidenced by the well-preserved remains of their palaces, fortresses, causeways, bridges, etc., some of which are very extensive, all being built of solid material and well constructed. That their religion was closely allied to that of the Peruvians, if not the same, is denoted by their temples and sepulchral mounds, these peoples, like the Mexicans, being sun-worshipers.

INCEPTION OF THE ENTERPRISE.

The history of this new movement, as we obtain it from Russell F. Lord, C. E. E. M, is as follows: About two years ago, Otis S. Gage, of New York, while on a business visit to the city of Guayaquil, in the Republic of Ecuador, met there a banker named Jose Maria Borja, who gave him information about three Spanish grants located in the Province of Esmeraldas, and which were represented to contain extensive placer deposits. The title to these properties rested in the banker, he having inherited them from his ancestors, to whom they had many years ago been granted by the King of Spain. These placers are worked by the negroes who inhabit the country, but in such an inefficient way that they afford the owner no revenue. As a consequence, he was anxious to have them pass into the hands of parties who could make their wealth available to all concerned.

Senor Borja had procured these mines to be examined and reported upon by Clarence E. Dougherty, a mining expert who had resided in Ecuador for 20 years, having at one time been in the service of the Government as State Engineer. Encouraged by the statements made in this report, Mr. Gage took an option on the entire property, which, on his return to New York, he passed over to a syndicate of capitalists, who sent F. S. Ketchum, an experienced mining expert and engineer, to further examine and report upon it.

A little later, Mr. Lord was by these same parties dispatched on a similar errand, he being further charged with the duty of selecting a suitable point at which to commence operations, make estimates for plant, etc., if in his opinion the proposed investment promised to be a good one. That the syndicate should have reposed such confidence in the judgment of this gentleman is explained by the fact that he had held many responsible positions in the line of his profession, having formerly been superintendent of the Delaware and Hudson canal, aod at a later period manager of several large and successful mining enterprises in Central America. He is a brother of Major Lord of the U. S. Army, now stationed at the Presidio, and comes of an ancient New York family, several members of which have been distinguished in both military and civic life.

RIVER SYSTEM—NAVIGABLE STREAMS, FORESTS, CLIMATE, ETC.

As before stated, the properties in question consist of three Spanish grants, named respectively the Cachavi, the Uimbi and the Playa de Oro, each comprising about 35,000 acres. They are situated in the Province of Esmeraldas (the emeralds) which occupies the extreme northwestern aogle of the republic, being nearly under the equator and close to the Colombian line. They are separated from each other by large and swift-flowing rivers, coursing generally toward the southwest and west, these rivers being named the Santiago, Bogota, Cachavi, Rio Cito and the Cayapas. The country between these rivers consists of low, rolling hills, cut by many *quebradas*, or ravines, through which flow streams of greater or less magnitude, all tributaries of the rivers mentioned. The Santiago river, of which all the others are confluents, is navigable for large vessels 18 miles up to Barbon, and for light-draft craft thence on 16 miles, nearly to the town of Conception, located near the junction of the Bogota and the Cachavi rivers, northern branches of the Santiago. From Conception freight can be taken in canoes up as far as the Cachavi mines. Vessels drawing six feet of water can go from San Francisco to Gage City, located on the river Santiago at a point six miles below Conception; thence to the Uimbi and the Playa de Oro mines a cartroad will be built, making but one transfer necessary between this city and these mines. On the bar at the entrance to the Santiago river

there is 15 feet of water at low tide, with a depth of 30 feet, and a safe harbor inside. At the mouth of this river stands the town of Simones or Posa, now the principal port, a distinction formerly enjoyed by Bolivar, situated on an outletting arm of the Santiago, a short distance to the north.

The country, with the exception of a few small clearings, is covered with trees of large size, with the dense undergrowth common in most tropical regions. From some of these trees, a species of cedar, a fairly good lumber can be made.

While the coast, both to the north and the south of this point, is hot and unhealthy, the climate in this particular district would appear to be both salubrious and comfortable, there being but little sickness among either the native or foreign population. The temperature keeps within the range of 72° to 82° the year round; these more favorable meteorological conditions being due to the influence of the cool ocean current from the north that here strikes the coast, to the many swift-flowing rivers that traverse this region and to the proximity of the Andes, several of the higher peaks of which stand close by on the east, their upper half never free from snow. While there are several months that are considered dry, showers occur here almost every day in the year.

THE GOLD BEARING DEPOSITS

Which cover nearly the entire area included within these grants, are composed of a body of gravel ranging from 20 to 100 feet in depth, the average being about 60 feet. This gravel, with the exception of a four-foot stratum of soil on top, is auriferous throughout, the presence in it of a small percentage of clay having prevented the bulk of the gold sinking to the bedrock, a soft formation, apparently of marine origin. The elevation of this bedrock above the outletting streams varies from 20 to 100 feet, insuring everywhere ample dump for tailings. The altitude of these several tracts varies from 50 to 800 feet above sea-level. As the gravel here contains no pipe-clay, hard cement or large boulders, it can be broken down and washed with a moderate head of water, no bedrock tunnels, derricks or powder-blasting will here be required. This gravel will, it is claimed, yield, under hydraulic-washing, an average of 40 cents per cubic yard.

When fully equipped and in operation it is believed that the total output of gold on each of these grants will exceed $8,000,000 per annum—$25,000,000 for the series of properties. That the net profit realized on this production will be large it is needless to say, that is, assuming that the data on which these several mining engineers and experts have based their calculations to be correct.

WATER SUPPLY—QUANTITY AND VALUE OF GRAVEL.

Any quantity of water can, by means of short ditches, be brought upon the mines, and there delivered under all the pressure needed. The supplying streams, having their sources in the foothills and outlying spurs of the Andes, are numerous and never-failiog, the rainfall in that region being superabundant. Owing to the loose and porous nature of the soil, much iron pipe and fluming will be required for bringing in the water.

For prospecting the gravel the facilities existing here were found to be extremely good, the many ravines and the open cuts made by the natives for washing out the gold affording ample opportunities for determining both the grade and the amount of the auriferous material, which latter, careful examinations, conducted at many points, showed to be very extensive. While the average value of the gravel was fixed at the figure mentioned, the experts are of the apinion that it will go much higher. The quantity of the gold-bearing gravel standing upon each one of these several grants was estimated at 700,000,000 cubic yards—2,100,000,000 for the whole property, giving a total of $840,000,000 in gold! These seem like big figures—in fact, they are big—hut they are not of our framing; we give them as we have received them, together with the authorities on which they are based; the same, as there is reason to believe, being wholly reliable.

PRIMITIVE METHODS OF GOLD WASHING.

Gold-mining in this section of country is not a new thing, the business having been practiced here for hundreds and perhaps thousands of years; first by the aborigines and later by the present inhabitants and their progenitors, and always of course by the crude implements and methods now in use; hence the small impression made on these deposits though worked for so long a time. These workings—mere open cuts of limited extent—sufficiently denote how little exhaustive have been the implements and methods of washing here employed. The present inhabitants of this district are pure negroes, descendants of the slaves formerly held in bondage by the Spaniards. Although they cultivate a few patches of ground, raising corn, melons, plantains, etc., their chief occupation is gold-gathering, a business pursued in the following manner: The miner seeks, not the richest ground, but a spot where rain water can best be collected, or the bank of a small stream into which he can cave down the bank with a crowbar and thus ground-sluice the dirt, a batea for cleaning up being used. If, by this process, his earnings amount to 25 cents per day, the miner is content; nor will he work beyond what his most absolute wants make necessary. Indeed, he has very little time left for work after having observed the numerous holy days imposed upon him by his religion, and which are said to slightly exceed the number of days in the calendar year! But, although thus handicapped by this creed and lacking in thrift, these natives are so faithful and manageable that with a little of the right kind of training they could be converted into good workers: wherefore it is expected that their labor can be made profitably available in operating the mines. All that the new owners of these properties purpose doing, when ready to begin active operations, will he the employment of white overseers, mechanics, etc., the common labor being performed by the natives of the country. For handling the canoe, packing goods, and various other kiods of unskilled labor, these people, both men and women, are very expert.

LAND AND WATER CARRIAGE.

Almost the only means of transportation in this country is by canoes on the more rapid streams and by larger vessels on the navigable rivers, or on the backs of men and animals, these other means of transportation being absent. There are not over 30 miles of railway nor more than 200 miles of wagon road in the entire republic, all other land communication being by mule trails, always bad and in very wet weather wholly impassible. The streams are generally without bridges other than those of the suspension type—a rope carried from bank to bank with a sort of car slung beneath, in which the traveler with his traps is hauled across. Made of agave fiber, these ropes, flimsy concerns at best, are liable to early decay, if they do not sooner part entirely, thereby rendering the passage of these streams, always deep and rapid, exceedingly dangerous.

It is a strange thing that a republic with its capital city so far inland should yet have between it and the seaboard no other means of communication than a mule trail; and yet the Spanish race has been in possession of this country for more than 300 years! Before Virginia City, the site of the Comstock mines, was ten years old, it had been connected with this port by rail, a great mountain range and a distance of more than 300 miles intervening between these two points. But then we have more enterprise, with fewer holy days, than this younger republic under the equator; secular time counts here!

From Engineer Lord, who, on his way to New York, stopped a few days in San Francisco, we learn that most of the plant for the new mines, which are to be outfitted and worked on a vast scale, will be procured in this city, the big iron pipes, giants, etc., having already been contracted for. As most future supplies will also be obtained here, San Francisco may expect to largely benefit by these great enterprises so about to be inaugurated in the land of the Incas! D.

Gold Mines of Sierra County.

From our Traveling Correspondent.

TO THE EDITOR:—In continuing my description of the mines of Sierra county, consideration will next be given to Forest City, where the mining interests have a more substantial appearance than any other part of the county. The place has from the earliest days been a successful camp, though it has of course known its dull times. But as one mine has become exhausted, another has risen to take its place and continue the flow of bullion. The Bald Mountain followed on the course of the Live Yankee, and now comes the Extension and the Ruby to fill the place of their once famous predecessors. The Bald Mountain channel, or Blue lead, as it is sometimes called, is an ancient river gravel deposit that has proven rich wherever developed. Its course has been traced from the southern portion of the county, near Minnesota, through Chipp's Flat and Alleghany, and north as far as the noted Monte Cristo diggings. Under Bald Mountain the channel seems to have branched; one branch running to the east and the other continuing northward. The character of the gravel in these branches is distinct, showing they were separate channels and from different points of origin. The north branch, as well as the main channel, is generally of a quartz formation. The east is distinguished by the granitic and porphyritic character of its gravel and boulders. Both have proven rich, though the east has been less developed, as it soon loses itself under a lava capping, and tracing it from the surface becomes impossible.

BALD MOUNTAIN EXTENSION.—This lies in the east channel and, as its name signifies, adjoins the old Bald Mountain mine. Captain Wm. Meikle is superintendent. The working tunnel is entirely in bedrock, a mile in length, and 25 feet below the pay channel. Consequently work goes on through upraises. Two drifts have been run north and south a distance of 900 and 700 feet respectively. Breasting is going on in the former, but not in the latter, as it is necessary to work this by incline.

The present indications are that the channel is widening and improving its even now splendid prospects. At times, lava spurs have run into the channel, directly across the course of the chute, that has threatened to pinch them out completely, but continued operations have invariably overcome the obstacle and carried them on to even richer portions. About 40 men are at work.

THE RUBY GOLD GRAVEL MINING CO.—This company's property lies in the north channel and, like the preceding mine, is an extension of the old Bald Mountain. Mr. E. McCormick is superintendent. The mine is developed by a bedrock tunnel 2200 feet in lengh, run in a southeasterly direction, and by about 8000 feet of drifts and gangways. They are now working northward toward Rock creek and also toward their southern bounds. The gravel here lies particularly in benches and work is done from three levels varrying as much as 100 feet in different channels. Thirty-five men are employed. The mine is said to be in splendid financial condition. A few months ago a nugget weighing 206 ozs. was found, valued at $3700.

WISCONSIN EXTENSION.—This is still in the nature of a prospect, but as it lies in the same general line as the foregoing, adjoining the Ruby on the north, it is well worthy of mention. Its channel, though well defined and rich, is supposed, however, to be distinct from the Bald Mountain. It is operated, under the superintendence of Mr. Henry Grant, in the interests of several Marysville capitalists. Work has been going on, the present season, on a small scale, through a 500-foot tunnel. The next spring, an old 2000-foot tunnel will be opened up and work begun in earnest—so 'tis said.

THE MAMMOTH SPRING CHANNEL.—In the Forest City district, east of and nearly parallel with the Bald Mountain channel, is another ancient gravel deposit known as the Mammoth Spring channel. It is, however, far less developed than the former, owing to the depth at which the gravel lies and the difficulty of tracing its course. Two companies are now vigorously exploring it. The first is the Mammoth Spring mine of F. A. Davis and E. B. Rambo of San Francisco and E. Spaulding, superintendent, of Forest City. A bedrock tunnel 2000 feet in length has been driven, and a few feet more was expected to bring them upon the gravel channel.

THE MAPLE GROVE MINING CO., under the superintendence of Dr. C. P. Saxton, is operating the west extension of the Mammoth Spring, and with a 325-foot tunnel also expect soon to be in rich ground.

ALLEGHANY.—Two miles south of Forest City is the Alleghany mining district. The interests here are entirely quartz, and the mines are, as far as quartz properties are concerned, the most promising of any in the county.

Messrs. Grant and Apple were the first to start a boom in this direction by developments in their Mariposa mine, half a mile south of Alleghany. Till two years ago, this was only an abandoned tunnel, run 25 years since. They bought it, ran ten feet farther, struck the ledge, and took out $75,000 in about a week. They have continued work and are now at the bottom of the creek, where it has become necessary to put in machinery to handle the ore and water. This will be done the next spring, and at the same time a ten-stamp mill will probably be erected.

Others quick to realize the quartz value of the district and develop promising properties are L. E. Newton of the Golden King, Chas. Hellman of the Rising Sun, and Fessler of the El Dorado. These claims are all on Kanaka creek, and about two miles east of Alleghany.

GOLDEN KING.—Mr. Newton has arranged for the immediate erection of a ten-stamp mill. The ledge, averaging two feet in thickness, and from $30 to $40 per ton in free gold and sulphurets, is exposed by three tunnels, the longest being in 160 feet, and from that a shaft sunk. A new tunnel is now running, and is in over 100 feet. The ore is being stored on a dump preparatory to crushing.

RISING SUN CONSOLIDATED.—Chas. Hellman of Oakland is the principal owner and superintendent. This also has all the promise of a big mine. The ledge averages four feet, the ore mostly free milling and high grade. Mill machinery will not be erected until next season, and the work now is entirely that of development. Four tunnels are in, the lowest being 200 feet, giving 300 feet of backs. An air shaft is being sunk to meet this tunnel.

THE EL DORADO, or, as it is more generally known, the Fessler mine, has also proven very rich as far as developed. San Francisco parties now have a bond on it, and they will in all likelihood buy it and erect proper milling works, etc. The mine is opened by three tunnels, the longest being 340 feet.

The ledges of these mines, and of the entire district, have a prevailing direction of southeast and northwest, and are presumably in the same mineral zone as the Eureka district of Nevada county, though the formations of the two counties are quite different. In Nevada they are almost entirely in granite, occasionally being on the contact of the slate. In Sierra, a haoging wall of serpentine and a footwall of slate and sometimes porphyry is the general rule. The middle Yuba traces the line of change.

Another promising quartz property in this district is the the Warwick mine, in French ravine, under the superintendence of Capt. W. H. P. Smith. This ledge is in serpentine and porphryry, and, as far as prospected, has given favorable evidences of a good continuous milling ledge.

At Pike City, the Alaska mine and its 40-stamp mill still stand idle on account of litigation. Parties owning it are anxious to work it, and others stand ready to buy if there is a chance of securing it. The mine was last worked at the 500-foot level, but has been allowed to fill with water during the past four years. There is talk of operations being resumed soon.

THE PILGRIM.—This is another splendid mill lying idle. It is at American Hill, seven miles east of Forest City, and is owned by San Francisco and Eastern capitalists, who spent immense sums of money in erecting a 30-stamp steam mill, and in developments, and then found there was lots of quartz, but not enough gold to pay for running the mill.

In the Downieville district, there are a few mines that are not worked out, but either lying idle pending a sale or working desultorily.

THE GOLD BLUFF MINE, of A. Van Slyke, two miles north of Downieville, is expected soon to he transferred to New York capitalists, in which case it will be reopened and large and new mill works erected. A 12-stamp mill is now on the property, but has not worked for two years. The mine is opened by three levels from the surface, the longest being 2300 feet.

OXFORD MINE, known as the Good Hope, lies back and northwest of the former, and on a parallel ledge between serpentine and slate walls. An aggregate of 1800 feet of tunnel has been run. Its operations will depend on what is done in the Gold Bluff. Mr. H. H. Purdy is the principal owner.

WIDEAWAKE MINE.—This is a gravel mine nine miles north of Downieville, on the Middle Fork of the North Yuba. W. B. Bosch is superintendent. The channel is reached by a 1300-foot tunnel. This is one of the very best mines in the district, the gravel having paid as high as $170 a car; yet it is not being worked with particular vigor.

ASBESTOS.—Four miles west of Downieville on Goodyear's Creek, B. F. Derickson of Forest city, has a splendid asbestos ledge. The ledge is two feet in thickness and has been traced a distance of 3000 feet. It has been partially exposed by a tunnel and a shaft, and at present San Francisco parties are negotiating for its purchase. The lode matter is of very fine quality, suitable for all commercial purposes. Timber and water are plentiful and available for a large manufacturing plant.

SIERRA CITY, once the center of the great quartz operations of the county, is wofully quiet. The closing down of the Sierra Buttes mine, and the suspension of several of the other prominnent mines, have left things here very much at a standstill for three or four years. Appearances seem to point now, however, to an early resumption of operations in many of these old mines, and to the opening of new ones.

THE SIERRA BUTTES.—Work was practically suspended here three years ago. The great lower or No. 9 tunnel,

two miles long, was abandoned, and is now caved the entire length. The 60-stamp steel mill is gradually being dismantled. Twenty stamps are engaged doing custom work; 10 have been removed to the hill or upper works of the mine; 10 have lately been sent to the Uncle Sam mine, Shasta county, owned by the same company; 10 stamps have been sold to the Mountaineer mine, and the other 10 have been dismantled for the parts. A few men have still been engaged working in tunnels 2 and 3, and washing the surface dirt and croppings. How long this work may continue is not known, as all operations may be suspended at any time.

THE PHOENIX.—This is the east extension of the Sierra Buttes. It is one of the few active mines hereabout, and even in the financial embarrasment of its former owners, necessitating a change of management in the past few months, its 10 stamp mill has continued busy. In the mine, a crosscut is run on the vein 700 feet, giving 500 feet of backs; the east and west drifts are 250 feet each, stoping going on in the latter. A wire ropeway, the invention of two Italians of Sierra city, is used to convey ore from the mine to the mill. This is one of the most interesting features of mining machinery to be met with anywhere. There is a single span of 2200 feet running from a point 1000 feet or more vertical height above the mill. Gravity furnishes the motive power. Two cables, one stationary, support the weight, and the other moves the buckets. The distance is traversed in about a minute and a half. To one who has never traveled by telegraph, to sail thus through the air 150 feet above the earth and suspended by a thread, comes nearest to the realization of that form of rapid transit. It is intended at some future time to run a tunnel from the mill, 1600 feet into the ledge, and thus secure nearly 1000 feet more of backs.

THE BIGELOW.—In the same group of mines is the Bigelow, a quarter of a mile above town. Mr. Geo. L. Morrison is working it at present under a nine months lease, and crushing the rock at the Sierra Buttes mill. This is another of those abandoned mines that only a blast of powder more was necessary to open up a rich chute of ore. The workings are open from the surface, the ledge being bent and quite flat, but dipping more steeply as it is followed in. This is the surprise mine of the camp. Mr. Morrison and his brother, both young men, took hold of it as a prospect, and in the first month's (July) run cleaned up $7000 on a 350 ton run.

BUTTE SADDLE QUARTZ MINE.—This is a quarter of a mile east and north of the Sierra Buttes ledge, and 1000 feet higher than the upper works of that mine, and at an elevation of nearly 8000 feet, the highest mine in this portion of the State. F. J. Seitz is superintendent. No permanent developments further than the two tunnels on the ledge have been made. The longer tunnel is in 1000 feet; 400 feet in a rich chute of rock was struck and a shaft of 40 feet sunk, showing a seven foot ledge between good walls. The owners are sanguine that it is a second Sierra Buttes bonanza, but lacking means to develop it fully, are anxious to bond or sell it. It is a good opportunity for the man or company with plenty of capital.

COLOMBO.—Robbin & Son of Trenton, N. J., are the owners; Wm. Penaluna, superintendent. The mine is west of the old Independence bonanza, and about four miles from town. As to its operations, further than the fact that its 10 stamp mill was running steadily on paying rock, I was unable to learn anything definite.

The Keystone group of mines, lying south of Sierra city, includes the Keystone, Marguerite, Mercer, Salinas and Cleveland mines. The last two are the only ones at all active. The ledge features of this group are an east and west strike, dip generally to the north, rock low grade, free milling, and country rock of slate and serpentine.

THE KEYSTONE, the axis of the group, is the property of Senator W. H. Mead. Its 20 stamps have remained idle for some time, and the lower workings of the mine have been allowed to fill with water. The mine comprises some 15,000 feet of vein and has yielded immense sums of money in the past. It has been stoped to a depth of 700 feet. Mr. Mead has arranged for the formation of a large company to reopen the mine. His plan is to run a tunnel from the river level and on the ledge, thus securing 2500 feet of backs in a distance of half a mile. It can he made one of the greatest mining enterprises in northern California.

THE MARGUERITE has remained idle for nearly two years on account of litigation. The mine is nominally owned in Boston, but at present is in the hands of lienholders. This is a very expensive property to work on account of the immense amount of water that must be handled, as the ledge runs east and west with the Yuba river and dips beneath it. Expensive and powerful machinery has been tried, but without success; a Knight's hydraulic engine proving even a failure after a long and costly trial. The mine has been worked through two shafts a depth of 400 feet. Whether practicable means of working this mine may be found or not is a question. There is a fine 20-stamp mill on the property. Five of these stamps are engaged on custom rock from a promising ledge lately opened by Chas. Rogers, four miles above Downieville, on the Sierra City road. Regarding the Cleveland mine, I was able to secure but few particulars. It is owned and superintended by John Castagnetto. It lies southwest of the Keystone, has a 12-stamp will and has been running more or less continuously for some months.

MERCER AND SALINAS.—Mr. J. Hutchison is superintendent of this mine. The property is a mile south of the Cleveland and on a parallel ledge which averages four feet and is here nearly vertical. There are two tunnels on the ledge, the upper in 560 feet and the lower 900 feet. The milling is done from the upper tunnel at present, although it is intended shortly to stope downward. Owing to lack of capital this mine has not shown the developments that its natural advantages warrant. It has a 10-stamp mill.

WILLIAM TELL.—This is a small though promising property a mile and a half southeast of town, and superintended by Caspar Joos. It has six small stamps. There are three tunnels, the working or lower one being in 500 feet, and it is expected soon to be on the ledge. This is on the same belt as the Keystone group. West of this is another small mine of encouraging prospects, owned by J. F. Mora and four associates.

THE YOUNG AMERICA has lain idle for nearly two years. This was one of the bonanzas, but through reckless and extravagant management or mismanagement its career has been varied and shorter lived than it should have been. Mr. A. C. Busch has now a controlling interest and it is his purpose to recommence operations this fall or the coming season. The mine was opened to the 2200-foot level, connecting with a 3000-foot tunnel. Much of the old works have caved and it is the intention now to work from the surface downward.

MOUNTAIN MINE.—This is the north extension of the Young America. It has a 10-stamp mill, an 800-foot tunnel and a well-defined ledge between good walls. The ledge is not yet sufficiently developed to keep the mill busy, but, "another season," Messrs. Winter and Berger, the owners, hope, will see them well under way.

CHIPS MINE.—This is about the one mine of the district that seems to be "standing on its own pins," and the management cares little about making public, facts concerning it. The mine is east and opposite of the Phœnix, on the east side of the Yuba. Mr. Sam Locke is superintendent. Work is prosecuted through a 1000 foot tunnel, and at present stoping is done from above. Next spring, with the introduction of proper hoisting works and pumps, sinking from this tunnel will begin. The rock is medium grade and the ledge averages four feet. Twelve stamps of 850 pounds each, do the crushing. Three power drills are used, two National and one Phœnix; also a Phœnix air-compressor 18x20, double cylinder, run by waterpower under 240 feet of pressure.

At Gold valley there are several mining enterprises of more or less pretension. I was unable to visit the place, but understood that Mr. Giles Gray of Oakland was operating a Tustin mill with considerable success. Lately, he had been putting in the MacArthur-Forrest process. On good authority, I hear it has not proven as satisfactory as its introducers had hoped. CHAS. E. TOWNSEND.

Mining Exhibits in Tuolumne County.

SONORA, Oct. 8, 1892.

TO THE EDITOR:—The fair of the 29th District Agricultural Association was held at Sonora, Tuolumne Co., Cal., on the 28th, 29th and 30th of Sept. and Oct. 1st. The attendance was exceedingly good, both at the pavilion and racetrack; about 1500 to 2000 persons visited both resorts daily. The directors of the Association, Messrs. Chas. R. Parsons, C. S. Fitch, Wm. Sharwood, Joe Majors, Dan Berger, Tom Barney, Jas. Goodwin, Jno. Shine (president), and W. Jones (secretary), are to be congratulated on the success attending everything in connection with the fair. Mr. Hawley, as assistant secretary, contributed largely to the prosperous working out of the details at the pavilion. To give an elaborate statement of all the exhibits would require too much space in your valuable paper, but I will briefly mention the mining, mineral, jewelry and machinery exhibits—the subjects most interesting to your readers.

One of the most prominent industries of Tuolumne Co. is the marble works of Messrs. Bannister & Co., situated on the banks of the Stanislaus river, near Columbia. Their exhibit was located in the center of the pavilion, being both conspicuous and attractive, as it was surrounded by the mineral and mining exhibits—all enclosed by a handsome gilded iron railing. The marble specimens were formed in an obelisk of pyramidal structure, rising some seven feet high, as follows: First, the base was a beautiful polished block of black or dark-mottled calcite; second, a cube rising upward of white and gray marble; third, a blue-gray variegated cube; fourth, a beautiful cube of pure white; fifth, cube of pink, with green streaks running through the block, rare and choice; sixth, and lastly, on top of pyramid, forming apex, a white block of calcite of white ivory cast, cut to a point, each and all clearly finished and polished, which reflected great credit from the perfect workmanship and artistic designs of the company exhibiting. They obtained the first premium. The future of this industry is assured.

Below the back of the marble obelisk, which rested on a raised platform of four sides, with radiating steps covered with black cloth, consisting of four tiers, were displayed the following stalactites, minerals and specimens of blocks of quartz from the undermentioned mines: Golden Gate, quartz rich in sulphurets of great value; Rawhide (mother lode), block of milling rock showing free gold and rich sulphurets with azurite and telluride of gold in profusion; Buchanan, rich rock; Soulsby, rich in free gold, galena and iron pyrites; Santa Maria, very rich pieces of quartz showing large quantities of free gold; Noonday, rich quartz; Eastern, rock worth $150 a ton; Labrador, good rock; Sonorita, valuable pieces; Monitor, rich block; Gerrymander, good, payable quartz; New Albany, many large blocks of splendid looking rock, value $8 to $15 per ton; Kettz, large blocks of fine rock, value $12 per ton; The Algerine, payable rock; Porto Fino, blocks of remarkably handsome quartz and sulphurets of very high grade, free gold value $35 to $42 per ton; Rising Sun, good exhibit of rock showing free gold of value of $10 to $40 per ton; Fair View, late Batten, exhibited block of sulphurets, value $1700 per ton; Alta, $100 rock; Charlotta, exhibited very handsome quartz, free gold $25 to $60 per ton, sulphurets of very high grade; Belcher, good rock; Gem mine, rich rock; App mine, mother lode, valuable quartz; Badger, Private, Joe Hooker and Geo. Mapes, ore rich in silver and gold, and many others of great merit merit too numerous to mention.

The mines above enumerated are mostly working, and all milling propositions, which entitles old Tuolumne to to class among the first rank of gold-producing ores, needing only the capitalist to invest and develop to secure fortunes. This county has been hiding her charms long enough under a bushel. She must take her place more prominently in the near future than in the past. It is certainly not the fault of Nature's laboratory that she has been kept somewhat in the dark. But she needs capital to unlock her treasures: then, under skillful management, she will be a large producer of the precious metals, second to no county in this State.

The present association is doing much in bringing our mines to the notice of the public, which in time will bear fruit. The formation of our county is varied—metallic slates, magnesium slates, metamorphic slates, porphyry, diorites, quartzites, syenites, granites, porphyritic granites, gneissic granites, schist, serpentine (or hydrous silicate of magnesia), limestones, talc or steatites. Samples of most of most of the above could be seen in the mineral collection. The display of gold specimens from some of the pocket mines and milling mines were truly magnificent. A few of the most beautiful must be mentioned:

The Sonora Bonanza, specimens of almost solid gold of great value; the Rawhide mine, specimens very rich in free gold and telluride of gold blended together; the Colby mine (pocket), exceedingly rich; the Fair View, rich specimens; the Sell mine (pocket), very rich specimens free gold intermixed with petzite, worth thousands of dollars per ton; the Sugarman, very rich specimens of free gold surrounded with petzite, very handsome; nuggets of pure gold from Saratoga Hill (pocket) of great value.

Under a special glass globe in the same case was a most beautiful specimen of gold, resembling a butterfly with wings extended, pink quartz forming the body, the wings a perfect tracery of delicate, gold-filiform crystals, feather-like or fern-like in structure. This is owned by Mr. James Goodwin of Mountain Pass, Jamestown. Large amounts of coin for this beautiful specimen have been frequently offered, but the owner refuses to sell at any price.

The particular specimen that took the first premium was intrinsically of greater value than the butterfly. It was recently discovered in a mine (pocket) on Bald mountain, owned by Messrs. Burney, Munroe and Wainwright. The quartz is of a pure white, hard and dense texture. The gold crops out in long crystal spikes, permeating the structure, rising two inches in column form above the plane of the matrix. The contrast of the pure white and yellow metal in such ahundance was rare indeed. The value in gold is several hundred dollars.

In the department of special cahinets there were exhibits by the following gentlemen: Messrs. David Oliver (Bonanza), C. S. Fitch, M. B. Harriman, F. Conrad and John H. Freak. Space, however, will not permit us to particularize their contents. We noticed a very handsome piece of ruhellite—a variety of tourmaline—being red or rose-colored. Mr. Cahezat exhibited a very fine collection of placer gold, some pieces weighing four ounces. We noticed also silver wire, natural product; ribbons of gold in all sorts of fantastic shapes of the precious metal—a study of themselves; how they could he so grotesquely shaped in nature without the aid of man is a puzzle. The same exhibit contained the following minerals: Chrome iron, cinnahar ores and cinnahar crystals, corundium (from Shaw Flat), chalcedony (polished and rough), copper glance, copper sulphates, chalcopyrite, hornite (or purple copper), native pure copper, chrome yellow, manganese (silicate), 65 per cent, opalized wood, silicified wood, pure tellurium, telluride of gold and silver, petzite, sylvanite (from Sugarman mine), tin hullion (Temescal). The whole of this department was in charge of the curator, Mr. J. H. Neale, as also the collection of jewelry made in Sonora and manufactured hy Mr. Neale, he being a practical goldsmith and jeweler. His mounting of diamonds and precious stones were greatly admired, and meritoriously received first premium. This display was a very pretty feature in this exhibit, showing the rough gold and the manufactured. The following is a short list of the principal gems and pieces shown: Large crescent of diamonds with ruby star in center; single-stone diamond rings; bar diamond pins; daisy-center diamond earrings; solitaire diamond earrings; rings of rubies, sapphires and emeralds. There were also miscellaneous specimens of jewelry, precious stones and mounted quartz—all manufactured in Sonora by Mr. Neale and aggregating in value about $2000.

We noticed also an interesting exhibition of giant quartz crystals, found in the Golden Gate mine in large groups of considerable purity. Each crystal was surrounded by a calcareous deposit of later origin, containing axite crystals, formation found in magnesium diorite crossings in the States.

Among the machines from the Sonora Foundry was an iron mining car—very substantial, and which was awarded the first premium. There was also a very ingenious safety gear, thoroughly applicable to any cage or skip, etc., for underground use in mines by way of shafts, by which a rope-breaking, in ascending or descending, the cage or skip, will remain at the point of breakage, so that no accident can happen to occupants. This was given a first premium.

We examined a very perfect working model of a five-stamp mill, with everything in running order, including ore-feeders, aprons, belting, etc., the whole driven hy a model vertical steam engine made by Millard Sweaver of Tuttletown, a 16-year-old boy. This obtained first premium. There were also various designs in scrollwork by the same boy.

There was exhibited a large working model of a locomotive in steel and brass, perfect in all parts, with cab and tender complete in every particular. It was made by Geo. Topping of the Sonora Electric Co., and received first premium.

The pavilion was lighted with electric lights by the Sonora Electric Light Co. The light was perfect, and gave universal satisfaction and pleasure to the concourse of visitors during the evenings, enhancing the beauty of the exhibits, and being so absolutely free from the usual attending heat of gas or coal-oil lamps, was a great luxury to all present, to the ladies especially. Music was furnished by the Snelling brass band of 18 pieces, with intervals of choice music on piano, violin, cornet and fife by our local talent, which was much appreciated. ARGUS.

Mechanical Progress.

Goldfoil-Making.

Up in the Bowery, in that wonderful old street, where beer and hymn books are sold in adjoining stores, there is a small shop where the ancient and curious business of gold-beating is carried on. A *Times* reporter, stepping in there the other day, found three men hammering with iron sledges queer-looking packages. The packages were bound in sheepskin, and were about the size of the fantastically done-up bundles of shooting crackers that retail for a dime. The men brought their heavy hammers down with the regularity of clockwork, turning over the packages frequently, and exhibiting the greatest care to leave no spot on them unhammered.

One of the workmen undid his package and took off the sheepskin covering, revealing what appeared to be many hundred square pieces of tissue paper, laid one above another, like the unhound pages of a book. He ran his thumh rapidly over the edges of the filaments. Between them was the bright glimmer of beaten gold.

"The manufacture of goldleaf," said the workman, "is a very tedious process."

He led the way to a hollow iron pan in which was a bundle of thin-strip gold, dingy like brass, several yards in length, and an inch in width.

"This," he said, "is the gold after we have melted it in the crucible. We put into the crucible an ingot of the precious metal, weighing 2½ ounces and worth $50. This is drawn from the crucible and run through a series of steel rollers under heavy pressure, aod comes out a long strip. This strip is cut up into 180 square pieces. Then that girl sitting over there picks up the square pieces of cutch paper, which is merely oiled paper.

"After she has put a certain number of square pieces of gold between the cutch papers, she does them up in a compact bundle, made firm at the sides by strips of wood, and covered with parchment envelopes, slipping the one over the other. The package then passes to the first beater. He lays it on the heavy stone anvil, which rests on solid ground, and hammers it vigorously for 20 minutes. This completes the first heating. The package next goes into the hands of a girl, who opens it, separates the leaves of oiled paper, and removes the sheets of gold now made quite thin.

"She cuts each piece into four pieces, and places each of the quarter squares between leaves of a very peculiar skin, oily in appearance, and more delicate than the finest tissue paper. Having in this way made other packages of the gold, they are given to the workmen, who hammer them for two hours on the stone anvils. The packages are returned to the girls, who open them and cut each piece of gold into four pieces, put them in other and similar packages of skin leaves, and give them once more to the workmen, who hammer them, this time for four hours.

"In this, the final package, are 900 sheets of beaten gold, each sheet so thin that 48,000 of them would not make a pile over an inch in height. From the hammerer the packages of goldfoil go to the girls, who take out the skins and do up the goldfoil for sale between tissue paper. There are 500 leaves of goldfoil in each bundle, and the bundle sells at $7 to $7.50. The original ingot of gold is worth $400 when turned into foil.

"The thin leaves of skin used in the beating process are made from the stomach of an ox, and only four of the little leaves can be obtained from one animal. The leaves are worth five cents each at wholesale, so that the 900 skins in each package are worth $45, or far more than the gold between them. A careless workman may destroy a skin after several heatings. The best skins, in the hands of careful and skillful hammerers, will stand 200 beatings.

"The little cups in which the gold is melted are made of sand. The parchment in which the packages are hound is mostly brought from London, and is hought up by peddlers from lawyers' offices. The hest goldheaters, as a rule, come from Germany and England. The parchment costs $1.50 per pound, and can be beaten for 30 hours." New York Times.

A Movable Coke Oven.

The Connellsville *Courier* recently printed a description of a new design of coke oven lately invented by Hugh Kennedy, manager of the blast furnaces of the Isabella Furnace Company, at Sharpsburg, Pa. It is as follows:

An entirely unique and simple design of a rapid, self-discharging coke oven has been invented hy Hugh Kennedy, of Sharpsburg, Pa. It is in actual operation at the Isabella Coke Works, at Coketon, Pa. The oven proper consists of a cylindrical frame of plate steel 6 feet high by 12 feet 6 inches diameter, strengthened and stiffened by a 6 hy 6 inch angle and made sufficiently strong to resist all expansion of the brickwork under the action of the heat of the coking coal.

To the cylindrical shell are securely riveted heavy-wrought steel hrackets inclosing four steel axles bearing directly on car wheels. These brackets and wheels are braced and stiffened properly so as to avoid any sagging or twisting motion that may be induced by moving the oven. The oven is then placed on rails and lined as a common, ordinary beehive oven; hut it has no contact with the foundation, except through the wheels to the rails, the arch resting in 6 by 6 inch angle.

The coal, when coked in an ordinary oven, is first watered and the fire extinguished before it can be drawn. This watering must necessarily cool the oven all over to a certain extent, and consequently when recharged it will take the coal longer to ignite. With the Kennedy oven, when the charge is properly coked, the small traveling car is run back of the oven, the hook of the ram is attached, and the engine, which consists of a small, simple, double-acting, reversing engine, is started, and hy means of a rack and pinion pushes the oven off its bed and carries the coke with it, which drops, piece hy piece, into the pit in front of the foundation, where it can be thoroughly watered and handled. The oven is then drawn back on the main foundation as hot as when started, and recharged with coal, which ignites the moment it touches the bottom.

As a great deal of coke is shipped in covered or boxcars, as well as open tops, it is necessary to arrange to load them as well as the others. This is effected by means of four swinging doors in the bottom of a chute. The doors are placed between the supporting rails and made to swing back out of the way, thus allowing the coke to fall to the loading floor below, which is on a level with the floor of the car, and from which coke can be conveniently loaded. The amount of time saved in drawing, charging and igniting is equal to a large increase in capacity. When the work is properly performed, the whole operation, from drawing to ignition, need not be ten minutes, a wonderful saving. The coke produced at Cokeville in the oven is as good as that produced in the ordinary beehive oven.

A Coming Large Steamship.

It is announced from London that the White Star Company has given an order for an Atlantic steamer which will eclipse all boats now in the service in points of size and speed.

The Belfast firm of Harland & Wolff is to construct the steamer, which is to be ready for sea in the spring of '94.

This vessel, which will be called the "Gigantic," will be 700 feet long, 65 feet 7 inches beam. She will have three screws, will be driven by engines aggregating 45 000 horsepower, and is expected to have a maximum speed of 27 knots with a sustained speed of 22 knots.

This announcement will probably seem somewhat strange to those who remember that the Great Eastern was unprofitable chiefly on account of her size, though she was 20 feet shorter than the proposed new vessel. There are many other essential points, however, in which the two vessels are quite unlike. In the first place, though longer, the new vessel will be over 17 feet narrower beam, and presumably of considerably less draught than the Great Eastern, while she will have ahout four and a half times the enginepower, and about 75 per cent greater speed. It is prohable, also, that she will have no such forest of rigging on deck as was given the Great Eastern, if indeed she have any rigging worth speaking of, which is doubtful, though we are not informed upon this point.

The Great Eastern was of wood, and had a single screw and two paddle-wheels.

These, the main points of difference between the two vessels, well illustrate the direction which the changes made in ship building have taken, and there is no telling where development along the lines indicated will stop, though it is likely to be a long time yet before another vessel is built equaling the enormous tonnage of the Great Eastern, which, at 30 feet draught, had a displacement of 27,000 tons. Such a proportion of width of beam to length, as that possessed by this vessel, is inconsistent with high speed, while such great depth of draught is a serious obstacle in entering harbors and in reaching docks. It seems probable that we shall, within a few years, possess many vessels exceeding the Great Eastern in length, power and speed, but not in tonnage.—American Machinist.

Scientific Progress.

Glass for Thermometry.

With reference to the report of Prof. von Helmholtz as to the progress of German technology, Lord Kelvin observed, at the recent meeting of the British Association, "20,000 thermometers standardized yearly in Berlin, 30,000 in the Thermometric Institute of Wiemar! This is really a matter of life and death; it is a matter of life and death to be able to distinguish between a temperature of 98° and 98½°. Fifty years ago with the very best and most expensive opticians, who combined with optical work the sale of thermometers at 15s. or £1, errors of from 1° F. to 1½° F. were found. Our thermometer-testing at Kew corrected that state of things about 40 years ago. In it the testing of thermometers is practically carried to a very close degree of accuracy; and thermometers so tested can now be purchased at moderate prices from ordinary opticians in this country. I do nnt know whether it is from Germany that our clinical thermometers are now obtained; but medical men have discovered that the practical use of clinical thermometers is of extreme value. We want to he told what is done in Germany in order that we may be led to increase vastly our resources in this direction. It is not a matter of national jealousy; but it may he properly a matter of national emulation. It is a nohle object to prompt the artisan of England to put in as good work, and to have as good scientific direction for his work, as his brethren in Germany. After what we have heard of what the Duke of Weimar is doing for promoting the usefulness of the work of the large number of glass-blowing artisans in his principality, we must feel that it would be well for the Government of this great United Kingdom to do all it possihly can to render the work of the artisans of England, Ireland and Scotland useful to this country.

"It has been said how important the Reichanstalt has been in thermometry in finding out the right kind of glass. Kew has been testing thermometers with a view of ascertaining whether it is possible to get glass here which will do equally well. I have thermometers in my pocket which Joule used in 1840. That glass is as good as any that can be made now. The art of making glass has been lost. The glass now made is not of the same nature as that made in this country 50 years ago. I believe if we could get back to the glass used at that time we should have thermometers equally as good as those. If such work had been carried on at Kew, together with the testing of thermometers to a greater extent, our instrument-makers would he in a position of making thermometers of a very high order. There is this other point clear also from the remarks made; the enormous importance of research work of this kind to the artisan, to the instrument-maker."

The contention is, apparently, that 50 years ago the work of graduation was done less efficiently than now, but that the glass of which the thermometers were made, being, perhaps, of simpler constitution, was less susceptible to influence inducing devious conditions of strain.

Dangers of Dynamite.

Theoretically, nitroglycerin, when exploded, decomposes into oxygen, nitrogen, steam and carbonic acid. Mr. P. F. Charon, in an article in the *Genie Civil*, states that practically a complete explosion is never obtained, and that the gas produced always contains the vapor of nitroglycerin, which is extremely deleterious to the health of those breathing it, producing headache, nausea and even vomiting. Carbon monoxide and nitrous-oxide vapors are also formed, the former being a poison, and the latter acting upon the mucous membranes, producing suffocation and violent coughing. According to the researches of Berthelot, Vielle and Sarran, one kilogram of nitroglycerin will produce, when exploded, 713 litres of gas and steam, calculated at 0° C. at 760 mm. pressure, but as the temperature is raised by the explosion to 6980° C., the volume occupied by the expanded gas at the time of the explosion is 18.900 litres, or nearly 20 cubic meters.

If this explosion takes place in a tunnel or drift of three metres cross-section the gases produced would be driven forward, and displace at least double the volume evolved, that is to say, for a length of 13 metres the air would he partly replaced. Nnw, although this gas is quickly condensed, it undouhtedly does linger sufficiently long to, in many cases, endanger the health of the miners. After citing the experiences of Dr. Darlington on the tunnel of the new Croton aqueduct, Mr. Charon advises that in the treatment of miners poisoned in this manner they be given strong hlack coffee, or, hetter, that they should cautiously inhale ammonia, sulphurous acid or concentrated acetic acid. Prevention is, however, better than cure, and he advises that the ventilation be made more perfect, in order to more quickly carry away the gases formed, and that the noxious gases he reduced in quantity by the use of an increased quantity of detonator.

Chemical Value and Preparation of Magnesia.

Magnesia, formerly chiefly valued on account of its medicinal properties, has recently risen into great commercial importance, owing to its infusibility and its employment as a lining for converters used in the basic process of steel manufacture. Caron, whose process was in the first instance followed, used calcined magnesite. This was made up with one-sixth of its weight of tender-burned magnesia, and from 10 to 15 per cent of water, into a plastic state; it was then compressed into hricks in iron molds and burned at a dull-red heat. Prof. Ehrenworth has pointed out that, if the refractory properties of the magnesia are tn he evoked to the full, it is of the utmost importance that the whnle of the magnesia should be dead-burned; the process, moreover, being carried so far as not only to expel the whole of the carbonic acid, hut also to cause the full amount of shrinkage which the material is capable of attaining. This extreme amount of calcination is very difficult to effect, owing to the tendency of the magnesite to fly into splinters, and to drop to pieces when subsequently touched, and in consequence of its being such a had conductor of heat the stone is very hard to burn in large pieces.

Recently dolomite, which is a douhle carhonate of lime and magnesia, has been used instead of magnesite. In order to prepare this material, there are two processes before the public; that of Closson and that of Scheibler. Under the former plan, the calcined dolomite is mixed with chloride of magnesium, the chlorine in which separates from the magnesia and combines with the lime, yielding a soluble calcic chloride which can readily be washed out, leaving behind the insoluble magnesia. Under the process of Scheibler, the calcined dolomite is treated with dissolved sugar, leading to the formation of sugar of lime, and depositing the magnesia. The solution of sugar of lime is then exposed to carbonic acid gas, which separates the lime as a carbonate, leaving the sugar ready for reuse. Both these systems of producing magnesia have the advantage of relative cheapness in their favor, owing to the low price of dolomite. Prof. Frank, of Charlottenburg, has advocated the use of magnesia as a substitute for plaster of paris for casts, and Grundmann has recently shown the advantage of employing a mixture of magnesia and powdered marble for this purpose. The author states that he has found, following the directions given hy Hirzel, that a mixture of henzole and magnesia is the very hest possible suhstance for the removal of grease from drawings or from any other material.—Annalen fur Gewerbe und Bauwesen.

STEEL AND IRON TUBES.—At the Saratoga convention of Master Mechanics' Association, a committee made the following report on Steel *vs.* Iron Tubes: "The information as to the relative merits of steel and iron for boiler tubes has excited considerable discussion, but your committee has very little definite information at present, We are, however, advised that in the case of a large number of steel tubes the results so far as wear is concerned, have been unfavorable. The following definite experiment, however, has been made: An engine was equipped with 114 iron tubes and 113 steel tubes on December 20, 1890. The iron tubes were placed on one side of the center and the steel tubes on the other side of the center of the boiler, the tubes being divided by a vertical line through the center of the flue sheet. On March 9, 1892, the flues were all removed. Seventeen of the iron tubes were condemned on account of pitting and corrosion, while 64 of the steel tubes were condemned of the same defect. This would indicate that steel tubes are more affected by corrosion than iron ones. Further experiments and information in this line, however, are desirable in order to fully settle this question."

NEW DISCOVERY.

Mines Revived and Miners Enriched

By the wonderful **Mac Arthur-Forrest Process**, Controlled by The Gold and Silver Extraction Mining and Milling Co. H. A. W. TABOR, Pres.; LEONARD GOW, V. Pres.; H. A. JUNES, 2d V. Pres.; P. GEO. GOW, Technical M'g'r. and Ass't Treas.; T. L. WISWALL, Gen'l M'g'r. and Sec'y; PETER MCCOURT, Treas.; W. L. COOPER, Eng.

DENVER WORKS: On the D. & R. G. R. R., near the Broadway Electric R. R. Depot.

GLASGOW WORKS: The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Queensland, Etc.

General Office of Company:

Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: Denver; The Livingstone Gold Mining Co., Boulder Co., Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co., Cal.; The Shasta Gold Ex. Co., Middle Creek, Shasta Co., Cal.; The Mercur Gold Mining Co., Fairfield, Utah; The Pacific Gold and Silver Extraction Co., Oro Grande, San Bernardino Co., Cal.; The Ora Bella Mining Co., Yavapai Co., Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co., Revenue via Norris, Mont.; and others in course of erection.

The object of this company is to introduce the Mac Arthur-Forrest process.

We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.

If you desire an experimental test communicate with the secretary.

If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons in Denver.

We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.

The process consists of pulverizing the ores to a fineness of about 50-mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tubs especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.

The total cost, as as rule, does do exceed from $2.50 to $5.00 per ton.

The most desirable class of ores for this process are the so-called refractory gold, ores pyrites, hematites, manganese and tellurium. We have also treated successfully dry silver ores.

We will be pleased to answer any inquiries and furnish any desired information. Address,

T. L. WISWALL,

P. O. Box 936. Gen. Mgr and Secretary.

QUARTZ SCREENS

A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.

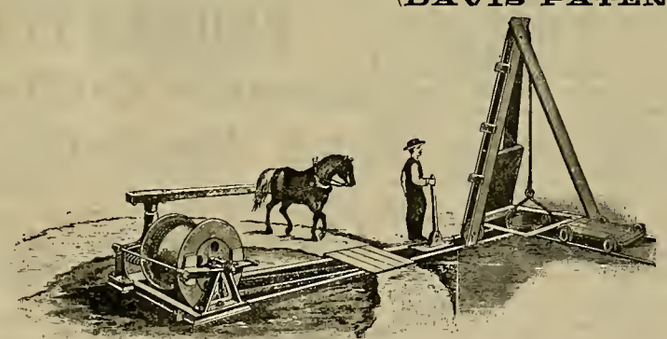
BUILDERS OF

"Sensible" Horse-Power Hoisting Whims.

(DAVIS PATENT.)



PRICES REDUCED.

The "Sensible" Hoist is the cheapest and beyond doubt the best in the market. It is built entirely of iron and steel, mounted on a heavy iron base plate, and is therefore very durable and not affected by exposure to climatic influences.

The bevel gear on the drum shaft is loose, and, in hoisting, drives the drum through a friction clutch. This avoids the frequent accidents occurring with other Whims, occasioned by the breaking of the gear teeth when throwing them out of gear. In lowering, the drum is pressed by a powerful screw lever against brake woods at the opposite end. Perfect means of adjustment are provided for the friction clutch and brake blocks.

As the drum is entirely independent from the driving gears the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases the capacity of the machine by avoiding the loss of time due to stopping and startling the horse.

It is very light and compact and very easily taken to pieces for transportation by mules. The cost of erection is very small, two men in half a day being able to put it in place ready for work.

Weight of hoist, 1200 lbs. Total shipping weight, including sweep, levers and sheaves, 1400 lbs.

Circulars giving Capacities and Prices furnished on application.

BALDWIN LOCOMOTIVE WORKS.

ANNUAL CAPACITY 1000. ESTABLISHED 1831.

LOCOMOTIVE ENGINES!

Adapted to every variety of service, and built accurately to standard gauge and templates. Like parts of different engines of same class perfectly interchangeable.

Broad and Narrow Gauge Locomotives, Mine Locomotives by Steam or Compressed Air, Plantation Locomotives, Noiseless Motors for Street Railways, Furnace Locomotives, etc.

COMPOUND LOCOMOTIVES

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies the information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not few. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, San Francisco.

RUPTURE, PILES and all Rectal Diseases POSITIVELY CURED, in from 30 to 60 days, WITHOUT OPERATION OR DETENTION FROM BUSINESS. Also ALL NERVOUS, SKIN, BLOOD PRIVATE AND CHRONIC DISEASES OF BOTH SEXES. STRICTURE AND URINARY TROUBLES CURED. No charge unless cure is effected. Consultation free. Call or address for pamphlet, DRS. PORTERFIELD & LOSEY, 838 Market Street, San Francisco, Cal.

Electricity.

The Elihu Thomson Prize.

At the last prize contest instituted by the city of Paris for the best electric meter, the prize of 5000 francs was awarded to Prof. Elihu Thomson. With the desire that this sum should serve for the development of the theoretical knowledge of electricity, he has requested M. Ernst Thurnauer, general manager for Europe of the Thomson-Houston International Electric Co., to offer a prize for the hest work on a theoretical work in electricity, and to organize a committee who should propose the subjects, examine the productions and decide the prize. The following gentlemen, we are informed, have been chosen, and have kindly consented to act as members of the committee: J. Carpentier, President of the Societe Internationale des Electriciens; Hippolyte Fontaine; E. Hospitalier, Professor in the School of Physics and Chemistry of the City of Paris; E. Mascart, member of the Institute; A. Potier, member of the Institute, examiner; B. Abdank-Abakanowicz, consulting engineer, Secretary of the Committee.

The committee has decided that the prize should be given for an investigation on one of the following subjects:

1. The heat developed by successive charges and discharges of condensers under different conditions of frequency, nature of dielectric and quantity of charge.

2. It has been shown theoretically that when the two surfaces of a condenser are connected by a conducting body, the condenser becomes the source of alternating currents as soon as the resistance of the conducting body decreases below a certain limit. The formula that permits calculating the period of this oscillation has not yet heen completely verified. This period of oscillation should be investigated experimentally under conditions such that the exact measure of resistance, capacity and coefficients of self-induction may be possihle, in order to arrive at a complete and precise verification of this formula.

3. When a condenser made with an imperfect insulating material has been charged and then left to itself, the charge is gradually dissipated. The time necessary for the charge to be reduced to a given fraction of its initial value depends only on the nature of the insulating material. It is proposed to investigate whether, as certain recent theories would seem to indicate, analogous phenomena do not preseot themselves in metallic conductors, and whether these can be shown experimentally.

4. It is proposed to arrange and systematize our present knowledge of the graphical solutions of electrical prohlems, and deduce from them some general methods as in graphical statics.

The theses presented may be written in any one of the following languages: English, French, German, Italian, Spanish or Latin. They may be in manuscript or printed.

Each thesis presented must be signed by a pseudonym and accompanied by a sealed envelope bearing the same pseudonym on tbe outside, and with the name and address of the author inside.

The papers must be sent before the 15th of September, 1893, to B. Abdank-Abakanowicz, consulting engineer, the Secretary of the committee, at 7 Rue du Louvre, Paris, who will furnish any further information required.

The Microphone as a Diagnostician.

Mr. J. Mount Bleyer, of New York, has been engaged for a number of years experimenting with microphones for the detection of feeble sounds of all kinds, which under any other condition could not be discovered by the unaided human ear. After a number of very costly investigations toward that end, he discovered the ideal microphone for making observation upon the feeblest of sounds, whicb would otherwise go unnoticed. This microphone is heing so arranged that physical diagnosis may be made directly with the microphone itself, in the same manner as with the present stethoscope. If, for instance, such a physical examination one wishes to preserve for reference, or otherwise, the microphone can also be attached directly to the phonograph and a record made of any special sounds of interest in the cost. This has been his ideal idea for years.

Dr. Bleyer has made numerous experiments upon the heart respiratory and the sounds of blood vessels, sounds of animals and human beings under varying conditions of life. In a specially interesting case, where death was not certain, the microphone decided the faint pulsation of the heart, which proved at once that life was not extinct. Many interesting points are connected with his investigations in the use of the phonngraph and microphone in relation to the science. His microphone is of original construction and principle, which accommodates itself to any position placed in on the subject under observation. This was the most difficult point to overcome.

His paper upon the new method of making physical diagnosis and use of the phonograph will appear before the International Congress at Rome, 1893.

We hope for the sake of ourselves that some one has given enough of his time to investigate a mode of discovering whether the circulation of the blood has ceased to make its rounds in the body after the doctor pronounces us no more, and save us these horrors so often related to us about cataleptic states and being buried alive. There is no doubt that such a microphone will be indispensable to the medical scientist.—Electrical Review.

LEAD-ZINC ACCUMULATORS.—The idea of employing a zinc plate as the negative in an accumulator and depositing an alloy of mercury and zinc during charging, dates back several years, and presents certain attractive features on account of the high E. M. F. obtained (2½ volts), and the reduction of weight in the negative plate, which may be further lightened by employing copper, on whicb the alloy of zinc is deposited. But experience has shown that the condition of the deposit is seriously affected hy the specific gravity of the solution at the time of charging, and by the rate of cbarging, which, in order to produce a good deposit, must be very slow. Again, as the result of cbarging is to liberate free acid, it is found that a charged cell left to stand will gradually lose its charge, owing to local action of the acid on the negative plate. In most accumulators it is the positive plate which gives tbe trouble, and this type of cell is subject to the same defect, but it suffers from the additional weakness in connection with the negative plate referred to above, which would require constant attention being paid both to the solution and the condition of the negative plate. One of the hest cells of this kind is that of the River and Rail Company of America, who are pushing a cell, the invention of Prof. Main. It is, however, very unlikely that the above inherent weakness will ever be overcome.—Electricity.

AN ELECTRIC GRAIN-BIN INDICATOR.—An electrical device has recently been designed for the purpose of assisting men employed in elevators to tell when the bin is full. The apparatus comprises an electric battery, a bell and a diaphragm which is placed in tbe bin at a distance of about 18 incbes from tbe top. This diaphragm is connected by wires to the battery and bell and when the bin is full the fact is indicated by the ringing of the bell, which continues till it is cut out by a switch provided for the purpose, the bin being also indicated by the number of the switch which corresponds to it or by a point annunciator. This device can also be applied to telling the amount of grain in the bin, which is now done by lowering a lighted lamp into the bin by a rope. Electric grain-bin indicators have been placed in Armour & Co.'s elevator, Chicago, hy Mr. E. Sberlock, who is interested in the invention with Newton & Co., of Aurora, Neb. This apparatus is worthy of investigation by elevatormen and otbers, as its introduction saves an immense amount of trouble and labor.

IN THE HOUSEHOLD.—The wife of a young electrician, well-known in New York, has just returned home after a protracted sojourn in Buffalo, where natural gas is almost as mucb of a household necessity and convenience as running water. She has many stories to tell about the labor-saving uses to which natural gas, combined with electricity, is put. The one that interested her husband most is her description of an arrangement which she saw in the house of a Buffalo friend, wbereby the master or mistress of the house can, upon awakening on a frosty morning, touch an electric button in the headboard of the bedstead and light the fires in the dressingroom, diningroom and kitchen. Another electric signal arouses the cook, and by the time tbat she reaches the kitchen she finds a hot fire awaiting her. The house meanwhile becomes comfortably warm while the members of the family are dressing.—Electrical Review.

ORDINARILY a travel of 100 feet per minute is considered a fair speed for pistons of pumps. For feeding boilers it should not exceed 50 feet per minute. In fire pumps, where the largest quantity of water is required, the speed exceeds 200 feet per minute.

STATE FAIR, 1892.

AWARDED BY THE CALIFORNIA STATE AGRICULTURAL SOCIETY TO

The following San Francisco Firms ana Individuals Received the Highest Awards of the State Agricultural Society at the late State Fair.

J. W. GRACE & CO,
BEST HYDRAULIC CEMENT, "Jasson."

WASHBURN & MOEN M'F'G CO.,
BEST WIRE ROPE.
BEST WIRE GOODS.

PELTON WATER WHEEL CO.
BEST WATER WHEEL---THE PELTON.
BEST QUARTZ CRUSHER---THE GATES.

ELECTRICAL ENGINEERING CO,
BEST DYNAMO AND MOTOR.
BEST SYSTEM OF ELECTRICAL POWER TRANSMISSION.
BEST ELECTRIC PUMP FOR IRRIGATING AND MINING.

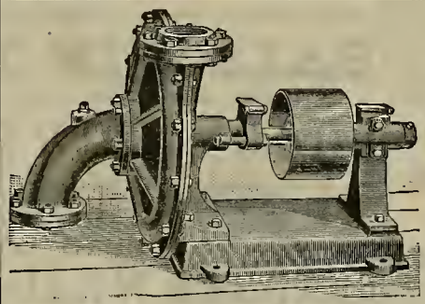
W. H. OHMEN,
BEST COMPOUND AUTOMATIC CUT-OFF STEAM ENGINE.

F. A. HUNTINGTON,
BEST QUARTZ MILL.
BEST ORE FEEDER.

GEO. E. WOODBURY,
BEST CONCENTRATOR FOR ORES OF ALL KINDS.

TROWBRIDGE & DYKES, Berkeley,
BEST WELL PUMP.
BEST MINING AND IRRIGATING PUMP.

THOMAS PRICE & SON,
Assay Office,
Sampling Works,
AND
Chemical Laboratory
524 Sacramento Street,
SAN FRANCISCO, - - CAL.



IMPROVED CENTRIFUGAL PUMP.

SAN FRANCISCO
TOOL COMPANY
HEADQUARTERS FOR
Machinery and Information for Irrigating Plants of All Sizes.
ESTIMATES CHEERFULLY FURNISHED.
Address Works, First & Stevenson Sts.
SAN FRANCISCO CAL.
Send or book showing cheap irrigation, mailed free.

DEWEY ENGRAVING COMPANY,

Engravings made from photographs, drawings and original designs, for newspaper, book, card and job printing Engraved prints enlarged or reduced, cheaply and quickly. Also copies of manuscript, legal documents, wills, contracts, signatures, portraits, buildings, machinery and printed documents reproduced with accuracy. Photographs, stereoscopic views, etc., duplicated, enlarged or reduced. Slides for magic lanterns made from photographs lithographs, and steel or wood engravings, etc. Satisfaction guaranteed. Agents wanted in all cities and in all towns. Address, for further information, DEWEY ENGRAVING CO., 220 Market St., San Francisco.

Metallurgy and Ores.

SELBY SMELTING and LEAD CO.,
416 Montgomery St., San Francisco
GOLD AND SILVER REFINERY
And Assay Office.
Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.
—MANUFACTURERS OF—
BLUESTONE,
LEAD PIPE,
SHEET LEAD,
SHOT, Etc., Etc
ALSO MANUFACTURERS OF
Standard Shot-Gun Cartridges,
Under Chamberlin Patent.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospecters, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
M.C.Co. BATTERSEA
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.
Agents for the Morgan Crucible Co. Battersea, England. Also for E. G. Dennistoun's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

A. T. DEWEY. W. B. EWER. G. H. STRONG.
DEWEY & CO.'S
Scientific Press **Patent Agency.**
ESTABLISHED 1863.
Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:
Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco
Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION—JUST OUT.
Price $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.
Table of Contents:
Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

Malthine M'f'g Co.
FACTORY:
Cor. Jefferson & First Sts., Oakland, Cal.
MANUFACTURERS OF
ACID, ALKALINE AND WATER-PROOF PAINTS,
Superior to anything of the kind in the market for
IRON, WOOD AND TIN.
Unequaled for Submerged Timbers. Red and Brown Paints for Roofs, Warehouses, Stables, Fences, Etc., mixed Ready for Use. Also, Sheathing Paper, Portable California Mastic Roofing, the Best in the Market for
RANCH AND CITY.
AND UNEQUALED FOR
Teredo-Proof Pile Covering.
This Company also Manufactures a Malthine Compound for
RENDERING BOOTS AND SHOES WATERPROOF.
The same is a superior article for Preserving Harness rendering it Impervious to Moisture and keeping it always pliable and soft.
Send to Factory, Jefferson and First Streets, Oakland for Samples and Prices.

Useful Information.

The Powder Stover.

There is not a life insurance company in the country that would take a risk on the life of a "powder stover." Most people never heard of a powder stover, and if all the powder stovers in the country were to go on a strike to-morrow there would not be much of a rush to get their places, for the business of a stover is about as unhealthy a job as anybody could well imagine. After gunpowder has been manufactured there is always a certain amount of moisture left in it, not so much as to prevent it going off with a bang if a spark should fall on it, but enough to retard its greater efficiency. To make it perfect it must be dried, and the stover looks after that part of the manufacture. The powder is placed in canvas-bottom trays, and placed on racks in the stoving-room until the shelves are all full, and the stover looks round with pride on three or four hundred pounds of powder which he is to bring to perfection. The stover does not get his name from keeping up a fire in the room; "stoving" gunpowder would go undone if it had to be performed in that way. The room is heated by steam pipes to a temperature of about 125° to 135°, and the stover looks in from time to time to see that everything goes on right, for each batch of powder must be stored from 12 to 20 hours. The possibility that at any moment the powder, the building, and the stover may be instantly converted into a large hole in the ground renders his visits brief, but go he must, in order to make sure everything is right. The necessity of making a living compels some to be "stovers," but there are persons who, if driven to that occupation, would rig up a thermometer inside the drying-room window, and do their observing from the outside with a long-range telescope.—Boston Transcript.

MICA AND ITS USES.—There is a greater range of use for ground mica than for the mineral in sheets, and, though the value of that part of the product made use of in this form is small, the many peculiar properties which ground mica possesses render it quite probable that its use will be widely extended. The difficulties to be overcome in grinding mica are considerable, and there are only two or three firms engaged in the business at present. Eight standard grades of ground mica are made. The coarsest of these are used to give frosted and spangled effects to the fancy grades of wall paper. The medium grades are employed in the manufacture of a lubricant for the journals of railway carriages, for heavy bearings generally, and for the axles of road vehicles. The finest grades are used in producing a uniform metallic white surface on wall paper. Scrap mica for grinding must be white and as free from specks or colored matter as possible, since any impurities in the scrap will affect the color and luster of the product. There is considerable consumption of mica on the part of the manufacturers of electrical machinery and likewise for stove purposes. The higher grade micas are used for the latter purpose. The lower grade micas are used by the electrical manufacturers.—Electricity.

HOW LIGHTNING SHOWS ITS INJURIES BEFORE A SUBJECT SO STRUCK.—It has lately been put upon record that, while a company of soldiers was being drilled in an open plain, near Berlin, it had been struck by lightning, and that a large number of soldiers had been more or less injured. Dr. Nicolai has lately published in the German *Military Medical Gazette* the outcome of his prolonged investigation of the case. He agreed with the conclusions of many other authorities, inasmuch as he holds that the injuries received on this occasion show that, apart from mechanical and calorific effects, life is most endangered by injury to the circulatory system. The peculiar arborescent figures so generally present on the skin of unfortunate individuals struck by lightning are, according to Dr. Nicolai, mainly due to obstructions in and consequent tumefactions of the blood vessels. Another fact brought into prominence on this occasion is the marked directional influence of metallic projections, such as are frequently met with on the accoutrements and clothing of soldiers.

COPPER VS. STEEL SHIPS.—Superintendent Cooper, of the Calumet and Hecla Smelting Company, says that he has given considerable thought to the matter of using copper in building ocean-going vessels; that plates of the thickness required would sell for 10 cents per pound after it had done years of service; that the avoidance of barnacles adhering to ships' bottoms by the use of copper was a great saving in fuel, for steamers cou'd then keep up the initial speed guaranteed by the marine architect, and the time saved by vessels not having to go into the dry docks to be scraped and repainted should also be credited to the cost of using copper. The deoxidized Lake Superior copper is only slightly acted upon by salt water, and for tensile strength and elongation it is fully equal if not superior to steel.

IS PETROLEUM INEXHAUSTIBLE?—In view of the oft-threatened exhaustion of coal deposits, it is reassuring to have the opinion of Dr. Mendeleieff, the Russian chemist, that petroleum is probably inexhaustible. This hydrocarbon, although not belonging to any particular geological stratum, is generally met with in regions lying along mountain chains, being found in Europe in the tertiary rocks and in America in the devonian and even in the silurian. The above-named authority attributes the formation of petroleum to the constantly renewed action of water on the metallic deposits of the hot central portion of the earth. The rapidity of its formation, which generally keeps pace with its extraction, is borne out by observation that the level of mineral oil is tolerably constant in wells and boreholes.—American Manufacturer.

SOME interesting experiments were lately made by the telegraph corps of an English regiment in the course of some night manœuvres. A cable was rapidly laid for a long distance over rough ground, and the officer in command of the manœuvres was enabled by this means to communicate with and direct the movements of his most advanced lines as readily as if they were within the sound of his voice. An attempt was made to produce on a map at headquarters a plan of battle during its progress by means of reports wired from the field, but this appears to have failed from some defects in the maps, although the feasibility of the scheme was demonstrated.

THE PLATINUM MINES OF RUSSIA.—The platinum beds of the Ural mountains, according to the *Journal de la Chambre de Commerce de Constantinople*, are the only ones in the world in which this metal is found in grains. Platinum is found in Brazil and in the Cordilleras in the hard serpentine rocks, but never in the form of grains. The platinum beds of the Ural mountains are found in various districts. The platinum found in these places is in the form of grains, in sand frequently containing gold. The weight of these grains is from 17 to 21 grammes to every 1640 kilogrammes of sand. The richness of the beds varies in the same proportions.

BRIQUETTES FROM CHARCOAL.—At Fagersta, in Sweden, briquettes are now being manufactured out of wood charcoal by the addition of coal tar. A paste is made out of the charcoal and the tar, which is transferred to a press whence it issues in slabs about 16 inches thick, which are exposed to the air on the ground for several weeks, during which period the water in the tar evaporates. This combustible has been successfully employed for steam boilers, its calorific power being said to approach that of the best English coals.

THE extent of the car-building industry may be inferred from the statement that the total number of freight cars in use on the various railroads in the United States is about 1,200,000, and that from 120,000 to 140,000 new cars are required annually to take the place of those that become worn out, the average life of a freight car being from eight to ten years. Besides, there is a constant demand for additional equipment by the railroads on account of the increase in their business.

A PHILADELPHIAN has invented a roller-bearing which seems to be quite practical in its work. It can be used on the axles of carwheels, wagon-wheels, pulleys and hoisting blocks. It is absolutely antifriction, no oil being necessary. The bearing is made of steel and has been put to test on a wagon which traveled over 15,000 miles. The inventor has been trying the bearing on some of the mining cars of the Philadelphia & Reading Coal and Iron Co.

THE United States gold dollar contains 25 8 troy grains. The ordinary pound, avoirdupois, contains 7000 grains, therefore $1,000,000 in gold coin weigh 3686 4 pounds avoirdupois, or over a ton and a half. The standard silver dollar weighs 412.5 troy grains, and $1,000,000 in the United States silver coinage will weigh 56 931 pounds, or nearly 28¼ tons.

Educational.

The Evans Assay Office and Chemical Laboratory.
628 MONTGOMERY ST., San Franc'sco.
ROOMS 46 and 47 MONTGOMERY BLOCK.
Ore Assays, Analyses of Minerals, Waters, etc., made. Lessons given in Assaying and Chemistry.
W. N. JEHU, Manager.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering,
Surveying, Architecture, Drawing and Assaying,
723 MARKET ST., SAN FRANCISCO, CAL.

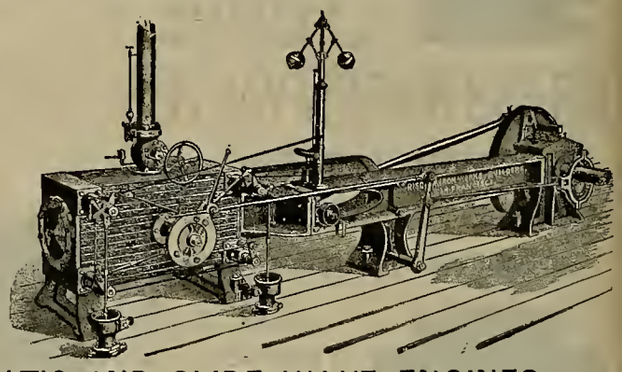
THE CORLISS ENGINE

AS BUILT BY THE

RISDON IRON WORKS, SAN FRANCISCO, CAL.

The principal features of the Corliss Engine are the cut-off or liberating device of the valve gear and the arrangement of the regulating mechanism. In no other make of the Corliss Engine has the same delicate sensitiveness, perfection and accuracy of control been attained. Instead of the old style crab-claw and liberating hook for disengaging the valves, our engines are fitted with gun-metal catches filled with hardened steel pieces for engaging the valve-lifting gear, these steel pieces being made square and reversible, have no less than EIGHT WEARING SURFACES TO EACH PIECE, and can be redressed on a grindstone without drawing the temper. This is a very valuable feature found on no other make of Corliss Engine. The valves have very large wearing surfaces, and can be easily taken out by simply taking off the back bonnet and pulling them out without disturbing or altering a single adjustment of the valve gear; this feature will also commend itself to all engineers as a great convenience in examining the valves and seats.



A COMPLETE STOCK ON HAND OF GAS, AUTOMATIC AND SLIDE VALVE ENGINES.

Matheson Patent Lock-Joint Pipe,

RISDON IRON WORKS,

Beale & Howard Sts., San Francisco, Cal.,

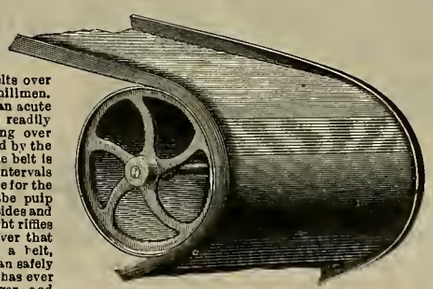
MANUFACTURERS OF

Improved Mining, Milling, Marine & Other Machinery.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now bavi·g our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.



H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

ATLAS IRON WORKS,

POTRERO, SAN FRANCISCO, CAL.,

BUILDERS OF

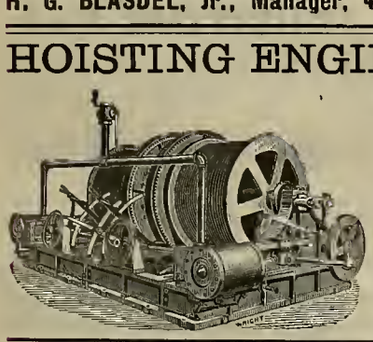
Mill, Mining, Street Railway
AND
Dredging Machinery,

PACIFIC COAST AGENTS FOR THE

Sterling Water Tube Safety Boiler,

Safest, Most Economical and Durable Boiler in the Market. Specially Adapted to Mining Purposes — Being Easily Transported over Mountain Roads.

HOISTING ENGINES FOR MINES



1, 2, or 4 Drums, with Reversible Link Motion or Pat. Improved Friction.

MADE ONLY BY THE

LIDGERWOOD M'F'G COMPANY,

5 & 7 N. First St., Portland, Oregon.
96 Liberty St., New York.
84 and 86 West Monroe St., Chicago.
197 to 203 Congress St., Boston.
610 N. Firet St., St. Louis.
99 First Ave., Pittsburgh.

The Judson Dynamite and Powder Co.,

MANUFACTURERS OF

Dynamite and Blasting Powder,

18 CALIFORNIA STREET, SAN FRANCISCO.

Directors:

ROBERT JUDSON, ALVINZA HAYWARD, THOMAS BELL, JOHN S. DOE, ED. G. LUKENS (President.)

TUBBS CORDAGE CO.

(A Corporation.)

Constantly on hand a full assortment of Manila Rope, sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal.

THE RUSSELL PROCESS.

For information concerning this process for the reduction of Ores containing precious metals, and terms of license, apply to

THE RUSSELL PROCESS CO.,
Park City, Utah.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

CLINTON CON.—Amador *Ledger*, Oct. 8: Some of the employes of the Clinton Consolidated have been put to work again, and we are credably informed that the entire force will be put to work again in about two weeks. The Bay State mine at Plymouth struck a heavy flow of water a few days ago, which drove the men to the surface, and now the engine is working night and day to get the water under control. Messrs. Wise and Seligman of Oakland, who are interested in the Farrell claim near the river, are here with the intention of making some improvements in that property. One of the gentlemen intends to remain here and personally superintend the work. Ground has been graded on the Kennedy mine property preparatory to the erection of a fine two-story house for the superintendent. The Kennedy people are sinking the north shaft 100 feet, with a sump of 60 feet. The Hardenburg mill has been shut down for a few days on account of a break in their water pipe.

Butte.

TWENTY-FIVE TONS A DAY.—Oroville *Register*, Oct. 6: D. K. Perkins came down from Gravel Range on Tuesday, and, speaking of his quartz mine, said he was crushing 25 tons a day, and hoped to put through 600 tons before the rainy season set in to stop work. He is obliged to haul the ore nine miles, so that as soon as rains begin the teams must stop, as the altitude is 6500 feet and the snow falls very deep. If the rock turns out satisfactory, a mill will be erected on the lode next season.

NEW MILL.—It is rumored that a new quartz-mill will be shortly erected in the eastern part of the county. The more the better; if the rich quartz mines of Butte were "whooped up," as they should be, 5000 prospectors would be at work in the Forbestown, Yankee Hill, Bangor and Hurleton districts within the next year.

Humboldt.

WILLOW CREEK.—Cor. Blue Lake *Advocate*, Oct. 8: Outside parties are fast becoming interested in the mining properties of Willow creek and Three creeks. Five more claims are in operation on Willow creek than there were at this time last year. Winter hers are being worked on the following claims: The Kelly, the Cora, the John Haney, the Curran and the Moore (the last mentioned under the superintendence of Capt. Furlong). The Begley claim will begin operations within a few weeks. On Three creeks there are now the Three Creek, the Marion C., the Riverside, the Enterprise, the Ebel, the Lodestar, the Ishber and the Golden Gate claims. The entire length of Three creeks has been taken up. Present information is not exact, but probably at least half of these claims will be worked the coming winter. The Moore claim on Willow creek has been sold to Eureka parties. Vincent White left on the 4th inst. to lay in winter supplies. Freeman Getchell of the Helen claim commences operations next week. C. S. Little will return to his claim to remain all winter. T. E. Knight's sawmill will be in operation inside of 30 days. John T. Talbot and S. M. Alcott of Portland, Oregon, and John T. Moline and Capt. J. M. Murphy, of Vancouver, have been visiting Willow creek and Three creeks. They think well of the mining outlook. Captains Furlong and Curran and W. E. Marshall left to-day on a prospecting trip.

SOME REDCAP COPPER.—Blue Lake *Advocate*, Oct. 8: The mines of Northern Humboldt and of Trinity are not coming into notice for the first time. They were known and to a greater or less extent worked 30 and 35 years ago. Major C. W. Long of Eureka, who, accompanied by Skiff Carson and James Wilson, passed through town Tuesday of last week en route to the Redcap mines returned Wednesday. Years ago Captain H. H. Buhne, Major Long and D. R. Jones took up and secured a patent for a tract of mineral land on Redcep, and 30 or 35 years back they undertook the development of a copper mine there. But the difficulties to be overcome were at that time too great. Improvements were made, a tunnel begun, and about five tons of ore were transported on muleback to Eureka, and thence shipped to San Francisco. The scheme, however, was not a paying one. The price of copper was so very low in San Francisco that it was deemed advisable to seek a market for the metal in Boston. The receipts from the ontput in the Hub city enabled the stockholders to come ont without loss, but there was no dividend. The process of development of the mine was thereafter discontinued, and the buildings erected have been destroyed and much of the timber that stood thereabont 30 years ago has been consumed by forest fires; but interest in the mine has been revived because development of it would not now be attended by so great disadvantages as handicapped the owners in earlier days. Major Long, who on his way to the bay called on the *Advocate*, had a number of specimens of the copper ore, some of which must be 90 per cent copper. He will send them to San Francisco and have them tested, by which test the precise value of the claim may be readily ascertained. If the test shall prove encouraging, it is among the probabilities that development of the mine may be recommenced. The gentlemen who are principal owners posess ample means for working it.

Mono.

BONIA CON.—*Miner*, Oct. 7: During the past week east croescnt No. 1, 550-foot level, was extended eight feet. North drift from Fortuna stope, above the 300-foot level, was extended six feet. Upraise from north drift, 200-foot level, was extended 11 feet.

MONO. — During the past week we have cleaned out and timbered the main south drift, 550-foot level, a distance of 60 feet.

Napa.

SHIPMENTS OF QUICKSILVER.—*Calistogian*, Oct. 5: During September quicksilver was produced at the mines as follows: Napa Consolidated, 510 flasks; Great Western, 366; Mirebel, 167; Sulphur Bank, 120. Total for month, 1136 flasks.

Nevada.

HERMOSA MINE.—Grass Valley *Telegraph*, Oct. 8: They are now hoisting qnartz out of the Hermosa mine, and it is good quartz. The ledge in the drift of the 200-foot level is nearly two feet thick and it prospects well. Gold can be seen in the sulphurets all through the rock, and in a very few days the company fully expects some most favorable developments other than those already in sight.

THE CONLON MINE. — Grass Valley *Tidings*, Oct. 9: Geo. Beebe and J. I. O'Connor, of San Francisco, president and secretary respectively of the Conlon Gold Mining Company, heve been in Grass Velley for the past few days in the interests of the company. They are more then pleased with the property and extensive operations heva been decided upon. The company purchased the property some time ego end reopened an old tunnel which had previously been driven some 250 feet in length to the ledge, and a test crushing of 14 loeds of the ore at Rodgers' mill yielded at the very satisfactory rate of $35 per ton. The size of the ledge is from two to five feet in thickness, and with a mill on the ground the property would prove a very valuable one, even if the ore did not average more than $10 per ton. The mine is situated on Osborne hill, near the well known Centennial mine, and the company owning the miue is a powerful one, comprising a number of capitalists from the East and San Francis o. Active operations will be commenced next week under the supervision of one of the best known citizens, when a large hoisting works will be erected and a quartz mill with the latest improved machinery for the reduction of ore will he placed on the property. The company contemplate running the machinery with electricity, should that power reach this city in the near future. The mine hes been worked for a number of yeers and considerable good qnartz has been extracted, although hnt a superficial depth has been reached. Those best acqusinted with the mine believe that it will prove to he one of Grass Valley's best dividend-paying mines when properly developed.

THE BRUNSWICK MINE. — *Transcript*, Oct. 6: There is a mine in Grass Valley celled the Brunswick. The stock is owned principally in New York. When the New Yorkers invested in it they thought a mine in Gress Valley meant nothing more nor less than a fortune to each of them. No good news came from the mine after they had put their coin into it, and the etock was being peddled out at a few cents a share. They got disgnsted and sent an expert out to investieate. That investigation went on for about ten daye, and the expert went to the telegraph office to notify the New Yorkers that there was nothing in the mine, no quartz ledge or any sign of one; that the ground was more suitable for a cahbege orchard than anything else. It was true that the mine was in the vicinity of the famous Idaho, which hed yielded its millions, but the Brunswick was not in it. The expert decided finally that he would wait a day or two longer before making hie report, and see what the men would bring forth by hard work in developing the mine. The next day to his astonishment a ledge was found, the expert telegraphed the prospect was good for a big mine, and now the New Yorkers are willing and eager to put up coin to prospect the property in a thorough manner.

Shasta.

FROM OLN DIGGINGS.—Redding *Free Press*, Oct. 9: The recent developmeuts in the Texas Consolidated hid fair to place said mine in the foremost of ore-producing properties in Shasta county. The ore-body recently discovered in tunnel 4 is by far the richest yet discovered in that mine. Talk about properties! why, the Texas Consolidated has now been under way for the past three years and, what is more to the credit of the owners of said mine, it has not been idle for a single day. Neither has the ore-body ever petered out. The mine, to-day, is without doubt the best mine in Shasta county. Recent developments in both the Mammoth and Central go to show that Old Diggings will ere long he considered the leading camp, so far as mineral production is concerned, as it will contain more claims from which high-grade ores are being taken than any other. Dame Rumor has it that Colonel Stevenson has made arrangements with the Joshua Hendy Company whereby the interests of both mines, viz., the Reid and the Old Spanish, will be consolidated in future. There is some talk of sinking a joint shaft, 500 feet in depth, for the purpose of developing both. If ore is found continuous for that depth where the shaft is to be located, it will be of vast importance to this community, and it will give an unheard-of impetus to our industry. [With reference to this item, inquiry at the office in the Nevada Block, in this city shows that the Reid Mines Cons. Co. have made an arrangement to work the mines of the Joshua Hendy Machine Works, adjoining their own, and that two deep shafts will be sunk to prove the veins, which are said to be very good on the surface. It appears that the quartz veins of that district have not been proven to a greater depth than 500 feet, and at that depth the Texas mine is working rock which averages $20 per ton, although the ledge is over 12 feet wide. The Reid Company is in good hands, with John L. Howard as president, A. S. Cheminant as secretary, and Robert Stevenson, the mining engineer, as general manager; and, as the company is said to be in possession of some of the best and most extensive mining property in thet well-known Shasta mining district, the "Old Diggings," good success may he expected from that quarter shortly. The company appeers to be carrying on the developments from the sale of treasury stock which is not assessable until $55,000 has been spent on the property, and a limited amount of this stock is being sold at the Pacific bank for $1 per share.—ED. PRESS.]

Sierra.

FOREST CITY.—Cor. *Mt. Messenger*, Oct. 7: The Maple Grove is looming up. Fine gravel is coming out and washing will commence about the last of the week. Experts pronounce in the deep channel, and predict a big mine. Some misunderstanding between the men and owners of the Extension mine caused the former to quit work again, and the town is lively. The boys are good-natured, however.

Siskiyou.

PAYING HANDSOMELY.—Yreka *Journal*, Oct. 12: The Phil Mott claim at Klamath river, below Honolulu, has been paying handsomely this season. In the last clean-up the owners realized over 350 ounces, working 20 men, who opened the cut in about three weeks. This mine has yielded upward of $30,000 for the present season. The McConnell & Quinn claim at mouth of Humbug creek, on Klamath river, has also been paying well, the pay channel being quite extensive and well up toward the surface. The Chinese claims on the river are also paying very well, but not so extravegantly as last yeer. It is difficult, however, to find out what success the Chinamen may have, as they generally say the mines are no good, no matter how rich they yield. G. W. Crowson brought over some rock from his quartz claim on the other side of the Siskiyous in the Cottonwood mining district a few days ago, says the Ashland *Tidings*, and had it assayed by Mr. Allman, the results being highly satisfactory, the rock going $272.53 per ton, $12.05 of the amount being in silver and the remainder in gold. Mr. Crowson had some dispute with parties in regerd to his ownership of the two claims adjoining, but succeeded in making en amicable settlement with H. D. Peersons, who had purchased the interest of the other parties. They split the difference, and he and Mr. P. now have a claim each side by side. The latter has purchased a five-stamp mill and will have it at work within ten days, it is expected. These claims are situated at the head of the old Kit Carson gulch on Black mountain, opposite Jilson's blue gravel claims. The ore is free-milling, and the owners think they have "struck it."

NEVADA.

Washoe District.

CONS. CALIFORNIA AND VIRGINIA.—*Chronicle*, Oct. 8: There has been extracted from all parts of the mine during the week 989 1600-2000 ons of ore which was shipped to the Morgan mill, the average value of which, per car samples, was $27.82 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $23.03 per ton per battery samples. Bullion shipped to Carson Mint, assay value, $30,693.25.

OPHIR.—1465 level—From the south drift, 101 feet below the sill floor of the 1465 level, from the Mexican into the Ophir ground, the west crosscut No. 2 has been advanced 18 feet; total length, 133 feet; in porphyry and clay carrying a little quartz of nominal value.

MEXICAN.—On the 1465 level the west crosscnt, which was started from the drift run north from the crosscut run west from the bottom of the winze sunk 101 feet below the sill floor of this level near the south boundary of the mine, has been advenced 17 feet; total length, 133 feet continuing in a soft porphyry and clay formation.

UNION CON.—900 level—The joint Union Con. and Sierra Nevada west drift has been extended during the week 27 feet; total length west from the joint sbaft, 2482 feet. The face is in porphyry and small streaks of quartz.

UTAH.—The north drift from west crosscnt No. 2 has been extended 18 feet; total length 78 feet. This drift continues in porphyry and clay showing narrow streaks of quartz.

SIERRA NAVADA.—The Cedar Hill drift has a total length of 29 feet; face in porphyry and low-grade quartz We have saved some pay ore from this drift during the week. The intermediate tunnel between the Cedar Hill drift and Kenosha tunnel has been advanced 20 feet; face in porphyry. The joint Sierra Nevada and Union west drift, 900 level, hes been advanced during the week 27 feet, making the total distance west of sheft 2482 feet; face in porphyry and small streaks of quartz.

ANDES.—East crosscut No. 1 north was advanced during the week 5 feet; total length, 169 feet; formation, porphyry and clay. Heve been timbering in this drift during the week.

GOULD & CURRY.—On the Sutro tunnel level, the joint north drift with Sevage Con has been advanced 10 feet through hard porphyry; total length, 576 feet; also did some repeiring during the week.

BAST & BELCHER.—All work has been discontinued in east crosscut No. 3. Started a west crosscnt opposite last crosscut and extended same 18 feet through soft porphyry and etringers of quartz.

HALE & NORCROSS.—We continue retimbering main shaft above the 1000 level. 1800 level—During the week advanced No. 1 west crosscut 25 feet; total length, 50 feet; face in porphyry and qnartz. Weet crosscut No. 2 on thie level was advanced 15 feet; total length, 33 feet; face is in quartz and porphyry. During the week west crosscnt No. 3 was started and has been advanced 18 feet; face in quartz and porphyry.

CHOLLAR.—We are repairing north drift, 750 level. The east crosscut, 160 feet south of north line, 930 level, is ont 119 feet; face in soft porphyry.

POTOSI.—The northwest drift from the 1800 station, Ward shaft, is out 930 feet; face in porphyry. Extracted and sent to mill the past week 429 500-2000 tons of ore from the 550, 930, 1100, 1150 and 1300 levels. Worked during the week 365 tons. On hand at mill 70 900-2000 tons. Averege car-sample assays, $24.75. Average battery assay, $24 08. Shipped to Carson Mint, 701½ pounds of crude bullion.

BULLION.—The north drift, from top of raise, 320 feet south of north line 1300 level, is ont 56 feet; face in porphyry and quartz that yield fair essays. The joint southeast drift from bottom of Potosi winze, 1850 level, is out 116 feet from footwall; face is in porphyry. The northwest drift from 1800 station, Ward shaft, is out 900 feet; face in porphyry.

WARD SHAFT.—The joint Alpha and Exchequer west crosscut, 1800 level, is out 127 feet; face is in porphyry. The joint Potosi and Bullion, northwest drift, 1800 level, is out 930 feet; face is in porphyry.

OCCIDENTAL.—From the stopes on 350, 400 and 450 levels we have extracted 170 tons of ore and milled 80 tons of the value of $17 20 per ton as per battery samples. The mill was idle three days pending repair. The main north drift on the 750 level hes been advanced 8 feet in low-grade ore. The Zadig drift, Sutro tunnel level, has been extended 25 feet in porphyry.

ALPHA.—The joint northwest crosscut on north line of Exchequer, 1300 level of Ward shaft, is out 127 feet; face is in porphyry.

EXCHAQUER.—The joint northwest crosscut on the north line of Exchequer, 1800 level of Ward shaft, is out 127 feet; face is in porphyry.

NEW YORK.—The south drift from the winze, 50 feet below the 650 level, is out 36 feet; the whole distance is in fair-grade ore. The west crosscnt, 800 level, 110 feet north of shaft, is out 30 feet; face in low-grade quartz.

SILVER HILL.—We are stoping out on a streak of ore on the 260 and 490 levels. Extracted and sent to mill the past week 189 1320-2000 tons of ore from the 260 and 490 levels. Milled during the week 189 1320 2000 tons of ore. Average battery assays, $24.56; average carsample assays, $29.21. Shipped to the Carson Mint, 79½ pounds of crude bullion.

Arabia District.

CLOSAN DOWN.—Reno *Journal*, Oct. 5: J. C. Hampton, foreman of the Arabia mines, near Lovelock, is in town. He says the mines closed down recently on account of the low price of silver, and threw 40 men out of employment. Mr. Hampton, who has had extensive experience in mining in Colorado and Nevada, says the mines would pay well and give employment to a large number of men if silver was anywhere near par.

ARIZONA.

MOHAVE CO. MINES.—*Miner*, Oct. 1: Never before in the history of Mohave county has the mining outlook of this region appeared so promising. From all parts of the country, and especially in the Indian Secret and Minnesota districts, come flattering reports of the steady improvement of the mining industry. A number of capitalists is negotiating for a number of properties in White Hills, and it is thought a sale will be effected in a short time. Parties leasing on the G. A. R. and the Prince Albert mines, in Indian Secret district, in some instances are taking out over $1000 per day. Some of the specimens on exbibition here from the former claim are nearly solid horn silver, and not less rich is the ore from the Prince Albert and a number of other mines in that region. As soon as cold weather sets in, it is thought there will be over one thousand souls in the new town of White Hills and mining will be started in a systematic manner. Conard & Conrad are still packing ore from the Columbus mine to the Flores mill. The Pittsburg mine still continues to send forth its usuel monthly quota of rich silver ore. The Flores mill is still running on good-grade gold ore, turning out bullion and concentrates. James Willard shipped two tons of ore from the Prince Albert mine, White Hills, to the sampler last week, for which he received about $800 net. The Prince Albert mine, White Hills, is showing up rich ore in many places under the developing hands of many leasers. Rich ore can be seen over the greater part of the claim. The Horn Silver mine, in Weaver district, continues to improve with depth. Several cuts have been made across the ledge, and show up the same rich ore the whole length of the claim. A tunnel, now in 20 feet, shows up 14 inches of ore averaging over 300 ounces. Tobe Wilkinson has struck a two-inch streek of ore on a piece of ground neer the Defiance mine, Indian Secret district, running $6000 to the ton. Malcolm McLeish came in from Gold Basin, Wednesday evening. He reports that the first hole started by the company in search of water had to be abendoned and a new one commenced. About 12 feet a day in depth is being made in the new hole, and as the work is now under competent supervision, it is expected that the well will he sunk to water. The G. A. R. mine, White Hills, is making a grand record for itself in the production of rich ore. From shaft No. 1, fully $4000 worth of ore is being taken out daily. The shaft is down about 70 feet, the ore-body being fully four feet in width. At the bottom there is one streak of ore 12 inches in width that will mill over $1000 per ton. Eighty feet east of this sheft, Sheriff Leke has sunk to about the same depth as No. 1, and hes the same rich ore all the way down. The mine so far as developed has no equal on the Pacific coast. Every day hut adds to ite value, and should it continue to show up as well with further depth, it cennot he purchased for $500,000.

COCHISE DISTRICT. — Tombstone *Prospector*, Oct. 8: As a producer of fair grade gold, ex-

cellent-grade copper and shipping grades of silver and lead ores, this district is destined to be a surprise to the most sanguine. The main copper showing of the district lies north of the railroad, in the vicinity of the Peabody and San Antonio. The limestons hills to the east, toward Croton springs, abound in indications that should lead to development, especially in that portion adjacent to the railroad. Just east of the railroad, about a mile and a half, the Golden Rule, Minneapolis, St. Paul, Black Thorn, White Thorn, Relapse and Mountain Key are each and all good healthy prospects, every one showing pay rock, the Golden Rule being a full-fledged mine.

RELAPSE.—West shaft now down 33 feet. The ledge is still narrow, but the ore is of fine grade, galena, black metal and chloride in white quartz matrix.

MOUNTAIN KEY.—This property has been purchased by Mr. Johnson and his associates. As this claim is an easterly extension of the St. Paul-Minneapolis ledge, is already developed by two shafts, one to a depth of a hundred feet, and there is nearly, if not quite, another carload on the dump ready for shipment, it is probable that work will not be pushed on this claim until the combination shaft on the Minneapolis-St. Paul mines has reached the 100-foot level. At about 60 to 90 feet the shaft will cut the ledge on its dip to the south, and the magnificent showing where work has been done on the ontcrop warrants the belief that when the ledge is opened up on the 100 another shipper will he on the hoards.

BLACK THORN.—At a depth of 42 feet in the main shaft the ledge has been stripped to the southwest for a distance of about 20 feet, showing a strength of fully two feet in width of honey-combed, rusty quartz, going well in gold.

IDAHO.

SOME GOOD MINES.—Idaho City *World*, Oct. 8: George Surfleet and A. J. Boyakin have men at work running a tunnel to develop at the depth of nearly 100 feet the Silver Reef mine, on Rush creek, west of the Half-way house, 15 miles below this city. The monntain is so abrupt that the tunnel will have to be driven only about 60 feet. A shaf was sunk to the depth of 10 feet, and ors from it gave average assays of $180, mostly silver. Selected pieces went much higher. The ore contains much native silver. Parallel with ths Silver Reef is the Larkspur, on which they ars also at work. Assays of ore from this mine gave returns of 110 onnces silver and $12.50 gold per ton. The work at present is confined to a surface cut. George Dunnigan and Surfleet will commence development work on the Sunlight in a few days hy resuming work in the tunnel, which will tap it at the depth of nearly 200 feet. There are many very promising locations in the district, and several great mines are sure to be recognized as such after more extensive development work is done. The formation is granite and porphyry and the ledges all carry copper, which is a very desirable feature, insuring permanency. A carload of ore will be shipped to Salt Lake or Omaha soon, with a view of ascertaining just what the ore will yield. Capt. J. D. Channell, who has spent a week among the mines hetween this place and Banner, informs ns that the 600-foot tunnel to tap the Edna mins, in Beaver district, at the dspth of 30 feet, was started nearly a week ago.

NEW MEXICO.

GOLD HILL.—Silver City *Enterprise*, Oct. 1: T. H. Snyder brought in 18 ounces of gold, the result of a mill run on 15 tons of ore taken from the Lottie claim in doing development work; besides this hullion, one ton of concentrates worth $150 was sold. Harry Logue is working successfully on his lease on the Engineer mine. His last mill run, made on a hatch of six tons for a test, returned $125 in gold hullion. The high-grade ore is about six inches in w dth, besides which there is four feet of good milling ore. H. C. Myers is taking out good ore on the Express mine, and will have a mill run made soon. Gold Hill is rapidly coming to the front and will soon he a noted gold camp. Every mine being worked in the camp is paying well. This is something that can he said of no other mining camp in the Weat. Idus L. Fielder last week shipped 65 ounces of gold hullion, the result of a mill run on 82 tons of ore from the Western Belle mine at Gold Hill. In addition to the gold hullion, ahont about $650 worth of concentrates were saved.

COOKS AND HARLEY.—James Martin has a magnificent showing of ore on the Inez, formerly the Montezuma, which had quite a history as an ore producer in the days when John A. Miller and C. P. Crawford were its owners. Immense ore hodies were then extracted, and now the claim promises to repeat its old history. Poe and Ashenfelter are working the Teel and Poe Mining Co.'s property under lease, and are shipping a carload of ore per day. The genial Colonel Milliken is running the Surprise mine on a most excellent and economical plan. He is shipping ahout 15 cars per month and keeping the mine in the hest possihle shape. John Fry, one of the most persistent miners in camp, has a good lease, and will he among the constant shippers from this time on. The shaft on hia property is 80 feet deep with two drifts 20 feet. The development has exposed a great deal of ore, which will amply remunerate him for all expended in development. Jap. Onstott is working his mines on the west side of the mountain and is shipping steadily.

OREGON.

PLACERS.—Bedrock *Democrat*, Oct. 5: Mr. A. H. Tahor is down from Snmpter and reports that his district is keeping pace with the rapid progress of the times and the season now drawing to a close is the most prosperons for years past. The placers have yielded handsomely and the Sumpter district may be depended npon for its full quota of the precious dust. A numher of the old-time placers havs heen worked this season profitahly, and new ground has given good results. Mr. Kimhle has a force of Chinamen at work in his diggings and will continne operations until snow flies. Archie Downie, the veteran miner, has enjoyed a prosperous season, and is now making hi final clesn np. The quartz properties in that section of the conntry are looking up and all indications point to a good future.

WHITE SWAN DISTRICT.—The developments in the White Swan district during the past year prove that it will hecome a rich gold prodncing region. The rich strikes that have heen made in the White Swan, the record of the Virtue in years gone hy, and with the recent developments and showings made in this old-time producer hy the Virtue Mining and Milling Compsny and their willingness to go ahead, the *Democrat* is of the orinion that there is a good future ahead for this district. There are other properties in the White Swan district that are as yet prospects, hut the snrface indications are all that could he desired and they promise to develop into good, substantial mines.

THE MONUMENTAL.—A mining man who has just returned from a visit to Granite and Greenhorn, stated to the reporter that the recent strike in the Monnmental mins was more exteusive than has heen made known. The ledge is over three feet wide and the ore wonderfully rich. It is the gentleman's opinion that the Monumental is a great property, notwithstanding the "black eye" it has so long heen wearing.

MILLING MACHINERY EXPECTED.—Thos. McEwen has the contract for hauling the mill machinery for the North Pole Mining Co. from McEwen to Cracker Creek. It is a hig contract, the machinery weighing between 150 and 200 tons. The plant is expected to arrive in a few days.

THE CARPENTER HILL MINE.—S. J. Fore, who has heen superintending the work on the Carpenter Hill property, informs the *Democrat* that work has heen suspended for the winter. The work accomplished during the past few months was attended with highly satisfactory results, and the company have good gronnds for helieving that they have a honanza. The crosscut exposed a fine 15-inch vein of fres gold. Mr. Fore then drifted for 40 feet on the ledge, which varied in width from 8 inches to 3 feet. In the face of the drift where work was suspended, the vein is ahout two feet wide and a fine hody of ore is in sight. The Carpenter Hill Mining Co. will develop the property on a larger scale next spring and expects to have a mill on the mine hefore the summer is over.

SOUTH DAKOTA.

HAY CBEEK.—De ad wood *Pioneer*, Oct. 6: Ex-Governor Larahee, of Iowa, and H. B. Young, of this city, own extensive and valuable interests in the Hay creek coal fields, which have already heen well prospected and exhibit a large quantity of coal of good qnality. The gentlemen have decided to thoroughly develop their property and place it in condition to allow continuous mining and marketing of coal. Yesterday they awarded a contract for extending the main tunnel on the property a distance of 1500 feet farther. The tunnel has already heen driven 700 feet and its face is in a vein of excellent coal. George M. Nix, who secured the contract for driving the tunnel, went out to the mines.

TWO BEARS.—Two loads of ore from the Two Bears mine in Strawherry gulch were received at the Deadwood & Delaware smelter for treatment yesterday. Shipments of a large amount of ore from this mine to the smelter will probably be made during the next few months.

Mining Companies' Financial Standing.

The following is the financial standing on the first Monday of the present month of the mining companies listed on the two exchanges in this city:

	Dr.	Cr.		Dr.	Cr.

*Collecting assessments.

NOTE.—Curry has concentrates valu d at $2000. Occidental has bullion and concentrates on hand value not known. Con. Cal. & Va. has $17,492.02 in bullion, with further shipments to arrive. The Navajo has $1300 due on pumping account.

DR. TILDEN, says the *Gas World*, has made the very important discovery that isoprene (C^5H^8), a liquid prepared by the action of heat upon turpentine, undergoes a spontaneous change in presence of acid and becomes caoutchouc. This artificial caoutchouc is identical with the natural in its composition, consisting of two substances, of which one is more soluble than the other in bisulphide of carbon or benzol, and it vulcanizes in the same way.

Market Reports.

Local Markets.

SAN FRANCISCO, Oct. 13, 1892.

General trade the past week was fairly active in all hranches. While saying this, it must be understood that the activity does not extend much, if any, heyond near-hy requirements. The spirit of conservatism, which has been the characterizing feature of trade, still dominates, and therefore in no line of goods is there any disposition to speculate. As long as this spirit controls, business will be conducted upon a substantial and confidence-inspiring hasis. Eastern mail advices report a strong-growing hut conservative trade. The demand is said to show an enlargement on the call which has ohtained at this season in former years. The New York *Commercial Bulletin*, in referring to trade, says that the volume of husiness was never as great at this season as it is now. But this means a really unusual increase in the distribution of manufactured products, hecause the movement of the largest crops ever grown last year swelled that part of the aggregate far heyond its usual proportions; and as this part was then much larger than it is now, the conclusion is inevitable that the remaining movement of manufactured products must this year he much larger than it was last year.

The local money market is tending to greater ease under fairly free remittances from the interior and no decided demand from any particular branch of trade or speculation. The financial standing, as reported at their annual meetings, of the Bank of California and Nevada Bank, gives evidence of a healthy condition (taking them as a fair example) of San Francisco hanks. Eastern mail advices continue to report a fair degree of activity in the leading money centers, with the call coming mainly from the great grain and also cotton-growing States. While an active money market is reported, yet there does not appear to he any tendency toward friction, and therefore all demands are expected to he met without raising the rates of interest.

The International Monetary Conference is attracting renewed interest. Under the discussion of the obj ct of the conference himetallism appears to he gaining ground, and as it gains in strength the opinion grows stronger that the meeting will result favorahle for himetallism. Probably one of, if not the most important points on bimeta'lism, are the views of Dr. A. Soetheer in a memorandum submitted to the Secretary of Treasury, and a few others interested in the coming monetary conference. Owing to the standing of the doctor and the accepted opinions of his views being feasihle, we give the points in full. He refers to the proposition submitted hy Maurice Levy, the Danish delegate to the International Conference of 1881, that silver be substituted for gold in payments not exceeding two pounds sterling, and that silver notes be issued to ohviate the necessity of carrying about so much silver. Dr. Soetheer considers this scheme likely to receive more careful consideration now than when it was submitted, and he has made important additions to it in the outline of an international monetary treaty which he has drawn up for the consideration of the Brussels conference. The plan defined by Dr. Soetheer, as translated at the Treasury Department, is as follows:

1. Recognition of some definite weight of fine gold as the universal foundation of the measure of value of monetary system.

2. Maintenance of the existing gold monetary systems of the various countries; cessation hy them of the further coinage and issue of gold coins under 5.8065 grams of fine gold (20-franc piece); ohligations of such countries to retire their smaller gold coins within the next ten years.

3. Uniform gold coinage charges of 2 per 1000.

4. Issue of gold certificates for gold deposited, by the principal mints or central hanks, for amounts of 500 grams of fine gold or multiples of that amount. Agreement on a uniform mode of assaying.

5. Retirement within the next ten years of all hank notes hitherto issued in the country and of other paper money of a value under 5.8065 grams of fine gold, and refusal to issue any longer either hank notes or other paper money under said value in gold.

6. Retirement of existing silver coins of a higher nominal value than 10 per cent of the value of the lowest future standard gold coin, witbin the next 15 years, and hereafter exclusive coinage of the principal coins in the value ratio of silver to gold 20 to 1. Coinage of the same only on account of the Government. Each country to retain its freedom as to the coinage of small divisional coins.

7. Obligation of the Government of each country to receive into its public treasuries the principal silver coins bearing their own stamp in payment of all sums.

8. Ohligation of private individuals and moneyed institutions to accept the principal silver coins of the country in payment to an amount equal to three times the value of the lowest standard gold coin.

9. Issue of silver certificates by the principal mints or central banks, against the deposit of the full value of the face thereof in the principal silver coins, in denominations not lower than one-half of the value of the lowest standard gold coin, and also in multiples of such amount. The immediate specie redemption of the silver certificates in principal silver coins, on demand and at all times at places of issue.

10. No issue of credit notes payable in silver only.

11. Ohligation of the several Governments, within eight weeks after the close of the calendar year, to inform each other of all the laws, regulations and proclamations issued hy them, within their respective domains, with relation to the monetary systems, as well as of the coins retired and of new coinages.

12. Liherty of each State to recede from this monetary treaty after 12 months' notice.

SILVER—The market the past week ruled strong at slight advances, closing with the tendency still upward. The statistical position of the metal and a growing impression that the monetary conference will report favorable on bimetalism, are the leading factors in promoting the strength. The stock of silver in England is very light, and to meet any demand from India, or elsewhere, the United States has to be called on for supplies, and as this country is now huying in excess of the production, our surplus stock is running down. During the first nine months of the calendar year there was exported from San Francisco $2,019,530 in hullion, against $473,219 during the like time in 1891.

MEXICAN DOLLARS—The market is firm at around 67½c. The exports from San Francisco during the first nine months in the calendar year aggregate $6,117,841, against $4,344,258 during the like time last year.

QUICKSILVER—Receipts the past week aggregate 524 flasks. The market is easy in sympathy with foreign and Eastern advices.

BORAX—Receipts the past week aggregate 2285 ctls., and exports by sea 2011 ctls. The market has held to steady prices.

LIME—Receipts the past week aggregate 11,252 bbls. The market is irregular under strong competition; Quotations are given at $1.20 to $1.50 per bbl.

ANTIMONY—The market is essentially unchanged. New York advices report more trading, with the market firmer at the follow ng quotations: 10½c@10¾c for Hallett's, 11c for LX, 11¼c for Crown and 11½c@11¾c for Cookson's in round lots.

PIG LEAD—The market is weak in sympathy with Eastern advices reporting heavy markets with supplies large.

TIN—The market for hoth pig and plate is dull, but holders, so far as we are able to learn, are not making concessions. New York advices report for pig an uneasy and unsettled market. This feeling is due to foreign advices regarding the supply and demand, and the market under control of leading manipulators. London cables report free purchases of plate for San Francisco.

COPPER—The market strengthened the past week. The New York market is telegraphed at quite an advance. The up move is due to large huying at New York and also in England for October, Novemher and the year. The New York buying was hy large consumers. London cahles to *Iron Age* are as follows: "Copper advanced 15@20s on improved demand for speculative account and better purchases for consumption, together with good demand from England and the Continent. European visible supply has decreased 1236 tons during the past month."

PIG IRON—The tone of the market appears to be improving in sympathy with stronger markets at the East ank ahroad. New York mail advices report an increasing call at all large distribution points.

COAL—Imports the past week aggregate as follows: Departure Bay, 2700 tons; Card ff, 2995; Seattle, 1800; Sydney, 2518; Newcastle, N. S. W., 4154; New York, 200. Total, 14,367 tons. The stock of coast coal is light, hut as the output of the mines is liberal, free supplies can he had at any time. The consumption is increasing. Steam coal on spot and due is firm. For loading, higher prices are quoted owing to higher freights demanded.

Eastern Metal Markets.

NEW YORK, Oct. 12.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	38⅜	83¾	11 25	4 00	20 40
Friday	38⅜	84	11 25	4 00	20 45
Saturday	38⅜	84¼	11 25	4 00	20 45
Monday	38⅜	84⅜	11 75	3 90	20 55
Tuesday	38⅜	84⅜	11 75	4 00	20 75
Wednesday	38⅜	...	...	...	...

Quicksilver continues easy. Borax is steady, with a good demand. Pig lead is barely steady. Copper is firm at an advance, under a free demand. Pig tin is doing better under strong manipulation.

Mining Share Market.

SAN FRANCISCO, Oct. 13, 1892.

The market the past week, under review, disappointed those chronic bulls who had confidently looked for better things, but conservative operators appear to be more than pleased at the way in which shares have been handled. They appear to see in it the earmarks of former deals, and in taking this view of the situation, they are quite hopeful of a coming deal, but not of a market. In this opinion the writer is more than hal inclined to take the same view of the situation, but whether the coming deal will come before or after election, or how much lower prices will first be dragged, are beyond our ken; but that a deal has been or will be planned is morally certain, for the mill-rings and stock-pools have too many shares on which to pay assessments, and these shares they will generously divide with outsiders, but at higher prices than are now quoted. Why we think they will send prices higher than are now current is grounded on seemingly authentic information, and also from personal observation that the rings' holdings average higher than the prices of shares now average; and it is not at all unreasonable to suppose that the rings will sell for less money than the shares cost. While firmly believing in a deal, yet the writer again warns patrons of the PRESS against venturing in, for the up-move will more than likely be similar to that made last month—very short-lived, hardly long enough around the high prices to let outsiders unload. If the mines were differently managed, and the ore honestly worked so as to fully conform to the law under which the companies incorporated, then the situation would have an entirely different look, and an outsider could invest in the shares with a reasonable assurance of getting dividends, for there is hardly a mine on the Comstock but can be made to pay dividends. Mine managers in this State (outside of the Bodies, which are said to be controlled by members of the Comstock mill-rings) make money out of mines, the ore from which does not assay one-sixth as high as does the ore extracted from Comstock mines, which are made to run in debt. It is a great game, this, of working the Comstock mines.

One of the most reassuring signs of the times, and which app ars to have a silver lining for outside shareholders, is the decision of Judge H bbard denying the defendants in M. W. Fox's suit against the Hale & Norcross directors a new trial. The judge quite properly gives H. M. Levy a severe castigation, and at the same time virtually says that other directors of the company were derelict in their duty by not looking more closely into the way in which the mine had been worked and the ore milled, and in being derelict in their duty to *all* shareholders, they became amenable, both civilly and criminally, to the laws of California. This is not the exact wording of the judge's decision, but, taking his former decision in the suit in connection with the last, the above virtually covers the situation. That the suit has made a change for the better in the management of some of the mines is witnessed in that of the Potosi. Now the mine is making money, whereas before it ran in debt. While the earnings are small, yet they are far better than running behind. In this connection, we will cite the returns for the past week of the Potosi, and also that of the Savage (the ore from both mines is reduced at the same mill). The Potosi had 365 tons of ore milled, which assayed as follows: Car sample, $24.75; battery, $24.08; difference 67 cts. The Savage had 525 tons milled which assayed as follows: Car sample, $22.35; battery, $20.76; difference, $1.58. And this is the smallest difference yet made under the reform (?) management of George Wells and H. Zadig. Alvinza Hayward, who is said to control Potosi, has had some experience, as in the Hale & Norcross suit, but J. L. Flood, who, if it is correctly stated, controls Savage, evidently has not. It is asked by more than one person why the Mining Stock Association does not enlighten him.

The share market opened this morning fairly active, but at slightly lower prices. After Cal prices hung around for a short time, then advanced slightly and closed steadily.

The ore reduced last month at the Nevada mill for the Savage Mining Co. returned 73 per cent in bullion, and that reduced at the same mill for the Potosi Mining Co. returned 89 per cent. It looks as if the directors of the former company want "an experience" similar to what the late directors of the Hale & Norcross had.

The market for outside mining shares has been more active in the Quijotoas at a slight advance. The Bodies have been dull but steady, as have the "razor blades" (the Tuscaroras).

Private advices from the Comstock mines are of an encouraging character. The general tenor indicates that in several, they ought soon to be in position to report new strikes. These new strikes are almost invariably ore run into years ago, and after answering the mill-ring's purposes, was neglected and, by the public, forgotten, but is to be again brought forward for use. It looks as if there are too many shares on hand for the comfort of the rings, and therefore anything which will help to unload will be acceptable. In Belcher they are preparing to stope ore for milling. Yellow Jacket and Crown Point have large quantities of good-milling ore ready for reduction. It is also said that Confidence, Challenge and Con. Imperial have considerable ore ready for milling. It is said that all the public will get out of the bullion will not be likely to pay for even a decent meal, unless the present system of working the mines and milling ore be changed to conform to the law under which the companies incorporated. Extensive and important work is being done in several of the Gold Hill, middle and north-end group of mines. Much of this is still kept back, or when reported is only touched on as if it were the merest accident and cuts no important figure.

It is reported that the mills on Carson river are to start up next week on ore from two or more of the Gold Hill mines.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co, Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING OCT. 4, 1892.

483,975.—VEHICLE AXLE—O. W Beach, South Riverside, Cal.

483,733.—BROOM GUARD—H. J Bennett, S. F.

483,891.—CIGAR LIGHTER—J. R. S. Birch, San Diego Cal.

483,901.—ROCK DRILL—A. Chodzko, S. F.

483,956.—MACHINE FOR REDUCING BRASSES OF JOURNALS—E. Ferris, Alta, Cal.

483,978.—BARREL STAND—H. H. Fisk, Florence, Or.

483,606.—DEVICE FOR CONTROLLING LIGHT FOR PHOTOGRAPHIC PURPOSES.—A P. Fleglor, S. F.

483,765.—DERRICK FORK—G. L. Laughton, Reno, Nev.

483,989.—COIN-OPERATED OPERA-GLASS RECEPTACLE—J. J. McDade, S. F.

483 851.—RAILWAY-CAR VENTILATOR—A. Minnick, Colton, Cal.

483,745.—ELECTRO-THERAPEUTICAL INSTRUMENT—J. W Moliere, S. F.

483 856.—ELECTRIC RAILWAY—W. G. Murphy Jr., Marysville, Cal.

483 724.—FOLDING-BED—W. B. Noyes, S. F.

483 861.—WASHING MACHINE—C. Osbon, Flagstaff, A. T.

483,748.—APPARATUS FOR MAKING MALT—W. A. Peters, S. F.

483 677.—HINGE SEAL CUTTER—G. W. Scott, Santa Rosa, Cal.

483 948.—SANITARY SEAL FOR COVERS OF TOILET VESSELS—C. Smart, S. F.

483,796.—WINDOW-SHADE SUPPORTER—S. T. Stuver, Puyallup, Wash.

483,950.—AWNING—H Vayre, S. F.

483 775.—CABLE RAILWAY GRIP—C. Vogel, San Anselmo, Cal.

483 774—CABLE RAILWAY GRIP—C. Vogel, San Anselmo, Cal.

483,754.—HARNESS SADDLE PAD—R. Whitman, Oakland, Cal.

21,875.—DESIGN FOR BADGE—A. T. Hatch, S. F.

The following brief list by telegraph, for Oct. 11, will appear more complete on receipt of mail advices:

George W. Brodheck, Los Angeles, beer-smoker; Alexander O. Brown, San Francisco, hook or musical holder; Winfield Curtis, Oakland, rail joint; David Dorward, San Francisco, tubular metallic pole; Charles S. Fay, San Francisco, sash fastener; George Ferguson, Los Angeles, hose hand; Joel A. Hayes, Carson City, Nevada, electric arc lamp; George C. Howell, Alameda, fruitpitter; Robert B. Moore, San Francisco, suspension hook; William P. Nolan, San Francisco, ratchet drill brace; William Radford, San Jose, continuous kiln; Chris. C. Reynolds, Kelseyville, cultivator and pulverizer; William W Ryder, Alsea, Or., saw-tooth swage; James M. Schofield, Merced, wooden liquid containing vessel; James Scott, Bethany, Cal., hame clip; Philip Sullivan, Tuscarora, Nev., fire escape; Jefferson D. Todd, Chico, Cal., sheep shears; Daniel Waide, San Francisco, book binding; Milo G. Wheeler, North Yakima, Wash., force pump and water elevator; Daniel C. Wilgus, Los Angeles, lawn sprinkler; James C. Plunket, Oakland, door fastener.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BROOM-GUARD.—Harry J. Bennett, S. F. No. 483,733. Dated Oct. 4, 1892. The object of this invention is to provide a guard for a broom, which is adapted to be readily applied and easily removed for use on another broom, and which, when in use, will protect and stiffen the straws and prevent them from turning and wearing unevenly, and which can be adjusted up or down to accommodate the wear and to permit the projection of so much of the broom-end as may be found best for different purposes.

CONTINUOUS FILE OR INDEX.—Alexander J. Rndolph, S. F. No. 483,312. Dated Sept. 27, 1892. This continuons file or index is an improvement on a former patent to the same inventor—No. 473,348, dated April 19, 1892. It consists of a series of cards, the faces of which are adapted to receive the slips containing the subject-matter of the index, said cards being hinged or linked together at their edges to form a flexible belt, and in conjunction with these cards, pins projecting from the edges of certain ones, and a support upon which these pins are carried so that the cards hang in folds of any desired length upon the support. With this device is employed a drum or other means for moving the index-sheets from one side to the other of the unspending-frame. The whole device may be so enclosed either to be invisible or with glass sides and a glass top is preferably provided, through which the cards may be inspected without opening the case or handling them. By this construction the inventor greatly simplifies the construction of an index, with few working parts and an ability to increase it to any extent, and still keep up the alphabetical order.

FOLDING-BED.—Walter B. Noyes, S. F. No. 483,724. Dated Oct. 4, 1892. This is one of that class of folding beds in which the mattress frame is pivoted to a fixed frame and is adapted to turn from a vertical or closed position to a horizontal position for use. The invention consists in the novel connection between the mattress frame and the main frame, whereby the former is accurately balanced in the novel supporting-leg for the outer end of the mattress frame, the novel means of supporting the woven-wire fabric, and other details of construction. The principal object of the invention is to provide a folding-bed in which the mattress frame can be easily opened and closed by reason of a spring connection with the main frame which accurately balances it.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

FULTON ENGINEERING AND SHIP-BUILDING WORKS. Capital stock, $1,000.000. Directors—Daniel B. Hinckley, Daniel E. Hayes, James Spiers, R. D. Chandler, H. P. Christie, L. C. Bresse and Frank A. Huntington.

PACIFIC GROVE ELECTRIC LIGHT AND POWER Co. (Pacific Grove, Monterey County.) Capital stock, $60.000. Directors—Nathan C. Carnall, George W. Hopkins, H. N. Bryant, H. E. Kent and Wm. H. Chapman.

OCCIDENTAL ALKALI Co. Capital stock, $600,000. Directors—F. Conn, E. Trude, R. J. Laws, S. A. Knapp and E. G. Knapp.

SAN FRANCISCO MARINE BOARDING MASTERS' ASSOCIATION AND SHIPPING AGENCY. Capital stock, $10,000. Directors—Niles Nelson, John Rogers, J. W. Wilson, Henry Brown, Samuel Winn, Cosmos Constantine and Peter Gaffney.

FREDERICKSBURG BOTTLING Co. Capital stock, $100,000. Directors—Otto Lang, August Lang, L. Lang, L. Mohlfeldet, Gustav Liehold. L. G. Scmidtt, Diedrich Todt and Heinrick Kracbt.

GROCERS' SUNDRIES MANUFACTURING Co. (Los Angeles). Capital stock, $24,000. Directors—C. S. Kions, Justus Kraft, F. J. Oshorne, Frank Humphreys and H H. Yerrington.

REDLANDS ELECTRIC LIGHT AND POWER Co. (Redlands, San Bernardino Co). Capital stock, $200,000. Directors—Geo. B. Ellis. H. H. Sinclair, Geo. H. Crafis, F. J. Ferand, G A. Cook, R J. Waters and James F. Drake.

TEHACHAPI LIGHT AND WATER Co. (Tehachapi, Kern Co.) Capital stock, $25,000. Directors—W. T. F. Smith, D. W. Madden, J. B. Beckwith, G. L. Robertson and Emmet Barber.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

STOCKHOLDERS' MEETING

Office of the Superior Mill & Mining Co.

Notice is herehy given that a meeting of the stockholdere of the Superior Mill and Mining Company will he held at the office of the Company, No 303 California street, Room 11, on Saturday the 29th day of October, 1892, at the hour of one o'clock, P. M., for the purpose of electing a Board of Directors until the next annual meeting, and for the transaction of such other business as may come before the meeting.

The Annual Election, not having taken place at the time appointed, and no call therefor having been made or published, and the Corporation having no Secretary, this meeting is called and notice thereof given to the Stockholders by the President of the said Corporation.

D L. MUNSON, President.

Office, Room 11, No. 303 California St., S. F., Cal.

DELINQUENT SALE NOTICE.

KEYSTONE CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of Works, Amador City, Amador County, California.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 3) levied on the 22d day of August, 1892, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
John S. Haver	11	233	$233 00
John S. Hager	130	100	100 0
M J McDonald	137	500	500 0
E. D. Rue, Trustee	138	025	9 5 00

And in accordance with law, and an order of the Board of Directors, made on the 22d day of August, 1892, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, 310 Pine St., Room 43, San Francisco, California on TUESDAY, the 18th day of October, 1892, at the hour of 12 o'clock M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

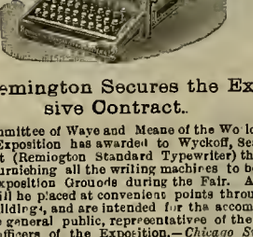
J. H. ISHAM, Secretary.

Office, 310 Pine St., room 43, San Francisco, Cal

REMINGTONS

AT THE

COLUMBIAN EXPOSITION.



The Remington Secures the Exclusive Contract.

The Committee of Ways and Means of the World's Columbian Exposition has awarded to Wyckoff, Seamens & Benedict (Remington Standard Typewriter) the contract for furnishing all the writing machines to be used on the Exposition Grounds during the Fair. A large number will be placed at convenient points throughout all the buildings, and are intended for the accommodation of the general public, representative of the press, and the officers of the Exposition.—*Chicago Sunday Herald, Aug. 7, 1892.*

The World's Fair Commission already use over 100 REMINGTONS in their own work.

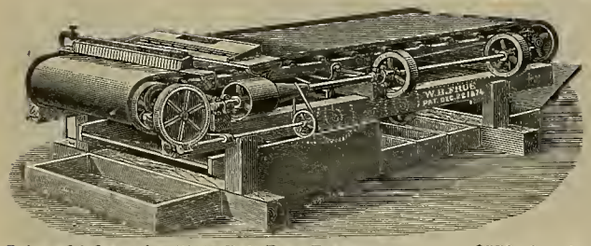
3 & 5 Front St., San Francisco, Cal.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.



Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

SAN JACINTO ESTATE, LIMITED,
Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators), extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner..... 800, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

No Sale for Mining Properties in England.

We have been favored by the perusal of letters recently received from London from a high authority on mining matters, which give a very discouraging account of the state of the mining market for the sale of mining properties in London. We are not surprised at this, when we notice from time to time the results of the disastrous management of English properties in America, properties, too, that had, anterior to the sale to foreign capitalists, paid regular dividends.

It seems to be fatal to the success and prosperity of a mining property to have it pass into English hands, when subject to the proverbial extravagant administration of an English board of directors, English superintendents, and managed at arm's length from a London standpoint. The odium of failures to make these properties pay is thrown upon us, it being asserted often that the property did not justify the price paid or that there was gross deception in the transaction. In fact the poor Yankee has to stand the odium of the failures due to bad management, and a succession of such failures to make our mines pay after passing into English hands has created such a prejudice in the English market that it has made it simply impossible to dispose of properties in that direction.

The fact that no property is ever purchased by an English syndicate except on the favorable report of their own engineers does not seem to be taken into account. It is a well known fact that these engineers rely solely on their own judgment, unaided by the superior opinion of our own experts, who are much more familiar with the characteristics of our mining regions and are, by reason of long experience, much better calculated to report on our mines intelligently; but even they cannot be held responsible for subsequent bad management of properties, that under our more practical methods would make such mines pay satisfactory dividends.

The mines which English experts are sent out to find are exceptional ones, and are very scarce. In fact, such are not in the market. They are firmly held by our own capitalists, who are satisfied to hold them for their own profit. It is unnecessary to send such abroad, as there is plenty of capital to take up this class of mines at our own doors.

It is commonly the case that only properties partially developed, or which are of doubtful value, are sent to London for sale. This fact seems to have dawned upon the minds of English capitalists, hence they decline to waste time in investigation, and the few that are disposed to make investments in our mines send out their own experts in search of a class of properties that owners are not disposed to part with unless at exceptionally high rates.

The principal cause, however, of the failure of the mines they have hitherto purchased is the excess of capitalization over any possibility of a satisfactory dividend. An English prospectus reads like a romance, and promises of large dividends are made far beyond any reasonable possibility of paying. It seems an impossibility for English promoters to limit the capitalization of a mining property to a reasonable amount on which it would be possible to pay dividends. It is therefore excessive capitalization and bad management which causes these constant failures, that we read of, to make American mines pay; and this is very generally the case in nearly every instance as well in their investments in African mines.

The best policy for our mine-owners is to go to work to develop their properties, and when they have done so, they can, if proving worth attention, look for purchasers at home, and not waste time and money in seeking a market abroad.

AT the annual meeting of the Nevada Queen Mining Company, 77,000 shares were represented, and the following officers elected: P. C. Hyman, president; Thomas Cole, vice-president; and Thomas Bell, G. W. Grayson and Wm. Bowen, directors. R. R. Grayson was reelected secretary and F. F. Coffin superintendent. The financial statement showed an overdraft of about $9000, but has an offset ore valued at between $13,000 and $15,000.

THE San Francisco Stock and Exchange Board has declared a dividend of $50 per seat, amounting to $5000.

Starting a Quarry.

The quarrying industry of California has been making great strides in the past few years. The amount of capital invested and number of men employed have largely increased, as have the number of quarries. In the larger cities, business blocks use a great deal of stone and the quarries all over the State have become valuable properties, especially where near suitable means of transportation.

On this page is an engraving showing the method of starting a quarry by the channeling process. This process in stone quarries is decidedly an American invention. It was first applied some 30 years ago to the marble quarries of Vermont, and at first its application was confined to marble. Lately its use has extended to limestone, sandstone, serpentine, slate, and to a limited extent to granite. The channeling process is not what it is popularly supposed to be; that is, it is not a process by which a bed of stone is cut up in the quarry as ice is harvested. Only those inexperienced in the channeling process apply it universally to a quarry-bed.

STARTING A QUARRY WITH INGERSOLL-SERGEANT MACHINERY.

The most useful application of the channeling process is to marble. Marble cannot be quarried successfully by blasting. Marble exists in solid masses, and in order to get at it, it must be cut up in the quarry. At no time in a quarry is it necessary to cut all around the four sides of a block suitable for lifting under the derrick, except when taking out the key-block.

Sandstone quarries and some limestone quarries are usually laid in free beds. This reduces the amount of channeling required. When the beds are thick, say upward of five or six feet, more channeling is required than with light beds. In everycase a great deal must be left to the judgment of the quarry foreman. The channeling process is of great value in saving stock; in directing the process of quarrying so that the best veins may be operated, and in increasing the capacity of the quarry. It also enables us to quarry stone without subjecting it to the shock of blasting. It assists in enlarging the quarry floor, which would otherwise grow less as the quarry gets deeper. It does not pay to quarry granite by the channeling process. A limited amount of channeling is done in many granite quarries, but it is confined to the walls, key-blocks, sumps, etc. The Ingersoll-Sergeant Drill Co., of which Parke & Lacy are the coast agents, build several varieties of channeling machines, adapted for use in quarry work. The machines cut the channels and keep the quarry in regular shape, so the blocks are removed ready for the market. The quarry is kept in a series of benches and there is little waste of rock.

Comment.

We have received several inquiries of late concerning the Crocker trip-hammer battery for crushing ores. This was a small machine, worked by hand, which was in use in this State 20 years ago, and was manufactured by the inventor in this city. There are none now on the market as far as we have been able to learn; at least, none are being made in this city.

Prof. Barnard, of the Lick Observatory, has discovered a comet hy means of photography. He is engaged in making star maps with a camera, and on one of the plates noted a fuzzy appearance made apparently by a moving object. The appearance on the plate did not denote a nebula, hut a comet; and, sure enough, telescopic observation at the spot indicated showed the comet. This opens up a new field of astronomical observation. This is the first time such a discovery has been made by mechanical means, and Prof. Barnard still further adds to his well-earned fame by making this discovery.

A correspondent asks us about the Pielsticker process and what it is. This is a new process owned by the Cyanide Gold Recovery Co. of London, which has been formed to work the patent. It is claimed for the new process that it has advantages in advance of any other cyanide process, that the method of working has been considerably simplified and the cost reduced, and that difficulties hitherto unsolved have been successfully overcome, and the syndicate announces its readiness to grant licenses to approved companies at a reduction of 50 per cent on the royalties charged for any other cyanide process. It is being introduced in Australia and South Africa and will shortly be brought to our attention here, when we shall he able to give some details of its operation.

In the death of Thomas Bell of this city the mining industry loses a stanch advocate. Among other things, he was the "quicksilver magnate" of this coast, controlling as be did the product of the principal mines. He was of the old firm of Bolton, Barron & Co., afterward Barron & Co. With Ralston and others they were founders of the old bank of California, original owners of the New Almaden quicksilver mine and incorporators of many other great enterprises. The firm itself was agent for Anthony Gibbs & Co. of London, for the New Almaden and other quicksilver mines and for silver and quartz mines in Mexico and many of the western States and Territories. Bell himself made an enormous amount of money, and ventured and lost a great deal. He built the railroad from San Jose de Guatemala to Guatemala City, wss one of the original incorporators of the California & Oregon railway, and owned large blocks of stock in the Triumpho mine, near San Blas, Mexico, the New Idria quicksilver mine, and in various mines in tbe Tuscarora and other districts in Nevada and California. He kept stock in many of these companies in late years counting among the most valuahle the quicksilver mines and the properties of the North Bloomfield Gravel Mining Company. Recently, with Mills and Randol, Bell bought the Standard mine in Lake county, and since then practically all the quicksilver produced on this coast has been handled through Tbomas Bell & Co. Mr. Bell was largely interested in several hydraulic mines in this State, and during his many years residence here has invested heavily in mining property in this and adjoining States.

Judge Gilhert of the U. S. Circuit Court granted an injunction against Chas. H. Laurence and others, to restrain them from operating a hydraulic mine. The mining debris from the defendants' mines escapes through a shaft 90 feet deep sunk in the lower level of the mine; thence it is discharged into a tunnel 3000 feet long, which empties into Canyon creek. Ahout a quarter of a mile below the exit of the tunnel a dam has been constructed across the channel of the creek. It is a crib dam of heavy fir logs pinned together at the corners and raised to the height of 28 or 30 feet. The interior of the crib is filled with stones. The current in the dam is sluggish. The width of the impounding pool is from 125 to 200 feet. The dam, though strong and well-huilt and capahle of sustsining great pressure, is of wood, and stands in the bed of a "torrential stream," and is, therefore, liable to be carried away by freshets. The debris impounded above the dam would by the same destructive forces be carried into the streams below. Canyon creek empties into the north fork of the Yuba river, about a mile helow the dam. The north fork of the Yuba discharges into the main Yuba; tbence into tbe Feather river; thence into tbe Sacramento. The impounding reservoir is not full, but its capacity, while considerably reduced at present, may be increased by raising the dam to a height of 100 feet or more. "It is evident," says the judge, "tbat with the increased height of a dam a corresponding increase in length must be made, thereby entailing a corresponding increase of tbe danger of its breaking. In view of the principles announced in the decision of this court in the mining debris cases in 1884 (9 Sawyer, 441), and in view of the justly grounded apprehension of injury to navigation in the case of any wooden dam constructed across the channel of a mountain stream, as in the case now before the court, I am of the opinion that an injunction should issue, as prayed for in the bill." Our antidebris friends take comfort to themselves from this decision, because the injunction was granted. It will be noted, however, that the main point is with relation to the wooden or log dam across a "torrential stream." Now the U. S. Engineers, in their report to Congress, recommend masonry dams to restrain the debris. These would be upon both torrential and navigable streams, or rather, above the latter. But the masonry dams are not to he built of cut and faced stones, but simply of rocks thrown across the stream. It is not desired to make them water-tight; hut simply to hold back the debris. This decision is not against dams in torrential streams, hut against timber dams in torrential streams. Had the dam been huilt of stone, as the engineers recommend, it is highly probable the decision would bave been different.

The Consolidated California and Virginia Mine.

The annual election of this mining company was held October 17th. The usual stereotyped form was changed somewhat through the introduction by the Mining Stock Association of the following demand and protest:—

We, the undersigned stockholders in the Con. Cal. and Virginia mine enter the following protest:—

The evidence in the suit of Fox vs. the Hale & Norcross Mining Co. disclosed to shareholders in the Comstock mines some of the reasons for the failure of dividends, and the constant heavy assessments of the stock. The line of methods by which thousands of dollars were fraudently appropriated by the millowners who milled the ores of the Hale & Norcross mioe have been adopted and successfully used by other milling companies on the Comstock.

We are now prepared to state to the stockholders of the Con. Cal. & Virginia that we have been plundered by the same system or methods, and property of the mining company to the extent of thousands of dollars has been unlawfully appropriated by the Comstock M. & M. Co. the corporation which has been milling the ores of the company for years. The contract with that milling company makes no provision for the protection of the property of the mining company hut under its terms the valuable ores of the mine are delivered into possession of the milling company to he by it milled without checks or guarantees of any character.

No percentage of the value of the ores as they are assayed at the mine is exacted, and the milling company is permitted and entrusted with the duty of ascertaining the value of the ores as they are worked at the mill and this valuation is accepted hy the officers of the mining company without question. Under this system the Comstock M. & M. Co. has been enahled to extract from the ores of the mining company vast amounts of hullion worth thousands of dollars and has thus unlawfully appropriated the same to its own use. Such a loose and unhusiness-like system would not be permitted by directors of a mining company not under the control of the milling company and we charge that the directors of the Con. Cal. & Virginia Co. are now and for many years have been under the absolute control and direction of the owners of the Comstock Milling Co. and through a shrewd and cunning manipulation have declared small dividends at long intervals and levy no assessments. Of the business of the mining company the stockholders have been falsely led into the belief that its affairs have been honestly and carefully managed.

The incident of three "astray" bars of hullion is hut an illustration of the facts and methods above alluded to.

We are prepared to furnish to the directors of this company a list of a great many hars of hullion of great value which has been claimed and appropriated by the Comstock Mill and Mining Company out of the ores of the Con Cal. & Virginia Co.

The directors to he elected should he instructed to suspend the further milling of ores under the unlawful contracts now existing between it and the Comstock Mill and Mining Co. and that a new contract he made making provision for the honest working of said ore.

The directors should he further instructed to make efforts to obtain a reduction in charges for milling, transportation, water and lumber which are exorhitant and unfair.

We charge that the Consolidated California aud Virginia mine is not managed in the interest of the shareholders of the company, hut in the interest of and for the profit of the Comstock Milling Co. In proof of this we submit the following figures:

Ore extracted from the mine from August 1, 1891, to August 1, 1892, 54,898 tons.

According to the pulp assay publicly given hy the company, this ore was worth an average of $23.37 per ton, or a total value of $1,282,767.08

The Comstock Mill Co. returned of this pulp assay in hullion $987,624, retaining in tailings $295,143. It received for milling 54,898 toos of ore at $5 gold per ton, $323,388, equal in hullion to $375,515.32, this making their receipts $670,645.32 hullion value, out of $1,282 767.08 worth of ore, or more than one-half of the pulp assay of the ore.

The company commenced the fiscal year with $98,374.94 in the Nevada Bank. It has crushed over 55,000 tons of ore worth nearly $25 per ton, and at the end of the fiscal year the company is reported in debt. Is this working the mine in the interest of the shareholders or in the interest of the mills?

We Demand:—1st: That the directors of this company take immediate steps to recover all hullion or its value unlawfully appropriated hy the Comstock Mill and Mining Co. out of the ores of the Consolidated California and Virginia Co. and we will furnish them a full list of all such fraudulently approoriated hullion.

2d: We further demand that the Board of Directors of this company instruct the superintendent of the mine to stop shipping ore to the mills owned or controlled hy the Comstock Mill and Mining Co.

* * * *

MINING STOCK ASSOCIATION, per
J. H. TINGMAN, Secretary.

The offer of the Mining Stock Association to furnish a list of the bullion claimed by them to have been fraudulently appropriated is certainly very suggestive, and as they have in the past always carried out any proposition they have made, it is absolutely the duty of the directors of the company, acting for the shareholders whom they represent, to take advantage of the proposition and regain this bullion for the use and benefit of the shareholders in the company. The voting for directors was very suggestive. What is recognized as the "mill ring" people voted 195,449 shares hy proxy and 36 shares of stock. The brokers, as usual, stood in with the mills and against their own customers. Of the proxies voted there were given by the

	Shares.
Anglo-Cal. Bank	3,781
Bank of California	15,475
Nevada Bank	23,482
Wells-Fargo Bank	9,766
H. B. Parsons	3 568
W. H. Oliver	4,828
	60 840
Proxy from Secretary	12,508
Proxies from Brokers	122,101
	195,449

The same old board of directors was elected and presumably will continue to run the mine in the usual way—a way which seems to benefit the millowners rather than the stockholders in the mine itself.

According to their own statements they commenced the year with cash in the Nevada Bank, $98,374.94. The mine produced during the year, in round numbers, $974,341.89. The indebtedness on Oct. 17, 1892, was $11,541.57. They received $1,084,258.40 during the year and out of this huge amount the mill company got about $500,000; while the shareholders got nothing.

The ore during the year averaged between $23 and $25 per ton, and the company is brought in debt. John W. Mackay in the Hale & Norcross case testified that $14 ore would pay a profit to the mine, and yet here is a mine partly under his management which loses money on $23 ore.

The stockbolders of Con. Cal. and Virginia owe it to themselves to see that the directors take immediate steps to recover the bullion reported as taken from the company, and to see that no more ore is sent to the mills owned by the people who have made such a record with them as was shown in the Hale & Norcross decision.

Another point to be considered is whether the banks which give proxies are not liable for loss brought upon the owner of the shares for which these proxies are given. If they help to elect "dummy" directors, who by their passiveness permit the property in their charge to be robbed, why should not the banks stand their share of their "illegal acts."

The whole business, as at present conducted, seems "rotten," and the people who own the shares are apparently looked upon as fair game. If they would let the shares of stock alone and compel the manipulators to hear the brunt of assessments there would soon be a change. As long as the people buy them, so long will they be robbed.

THE annual meeting of the stockholders of the Consolidated California and Virginia Mining Company was held on Monday. The old directors and officers were re-elected as follows: Charles H. Fish, George R. Wells, C. O'Connor, W. S. Lyle and H. B. Havens; Charles H.

Fish, president; George R. Wells, vice-president; A. W. Havens, secretary, and D. B. Lyman, superintendent. The financial showing of the company is not a favorable one, and unless some new and rich development of ore can be made during the incoming year assessments upon the stockholders are likely to be levied. The company had an indebtedness on October 1, 1892, of $11,541.57 according to the secretary's report against a cash balance on hand one year ago of 98,374 94, showing that during the year the company lost about $109,000 over and above its net earnings.

Foundry Notes.

The Pelton Water-Wheel Co., of this city, has been awarded the contract for the wheels and pipe-line for the new Morning mill now under construction at Mullan, Idaho. The pipe-line consists of 2850 feet of 10-inch and 500 feet each of 11 and 13 inch pipe. The concentrators are to be run with two 6-foot wheels working independently and a 3-foot wheel furnishes power for the rockbreakers. All of the wheels are to run under a vertical head of 900 feet. The Gates crushers have been adopted by the Morning mine for this new mill, which are also furnished by the Pelton Water-Wheel Co. These consist of two No. 3—each having capacity of 20 tons per hour. These crushers have been adopted by the Bunker Hill & Sullivan Co., who give an excellent account of their operation.

Preparations for the launch of cruiser No. 6, or the Olympia, as her proper name will be, progress at the Union Iron Works. The launch will occur on Saturday, November 5th. A dredger has been put to work to deepen the channel, and will continue to be employed until a sufficient depth of water is reached to overcome any possible danger. A new method will be employed in launching the Olympia. Instead of an electric button, as was used in starting the Monterey, only a string will be used, which will connect directly with the last blocks. A stroke of an ax will sever this string and cause the blocks to fall, when the cruiser will slide into the water.

The Union Iron Works are building some machinery for the Tepezala copper mine, which is about six miles from Rincon de Romas, on the Mexican Central R. R., on the estate of Agua Caliente. The Union Works furnished them last February with a hoisting engine, boiler and pump. Since that time the owners of the mine have ordered another hoist of greater capacity, with a larger pump, boiler, etc, to be put on a shaft adjoining the present mine. It is on another mine belonging to the same company. They have one shaft 350 feet deep and the one on which they are now sinking is 250 feet deep. It is the intention to continue this down much deeper. The new machinery is capable of doing this work to 800 or 1000 feet.

Work is quite dull at the Pacific Rolling Mills just at present. Generally the mills employ about 1000 men but now only about 600 are at work. There are a good many idle mechanics over at the Potrero, as both the large shops there are running short-handed.

Mechanical-Drawing.

"Mechanical-Drawing" is the title of a new work by John Wiley & Sons, which Osborn & Alexander, of this city, have on sale. It is a book of progressive exercises and practical hints for the use of all who wish to acquire the art of mechanical-drawing, with or without the aid of an instructor. It is written by Chas. W. MacCord, professor of mechanical-drawing in the Stevens' Institute of Technology, and who was formerly chief draughtsman for Capt. John Ericson. The exercises in part one embrace the essential features of a course of instruction which has been successfully pursued for 20 years. Those in the first two chapters are intended not only to train the eye and hand for the use of instruments, but also to form the habit of exercising freethought, judgment and taste in relation to the important matter of arrangement. Reasonable skill in execution having been acquired, the next step is to the delineation of solid objects. And in the treatment of projections the aim is to lead the student to draw these in a matter-of-fact way, as they would appear from different points of view; the express design being to keep out of sight as far as possible the artificial and often useless stage machinery of descriptive geometry. The division of subjects is: Elementary exercises; straight lines and circles; drawing noncircular curves; principles of projection; objects in inclined positions; of the helix and its application in the drawing of screws; intersections and development of surfaces; isometrical drawings, cavalier projections and pseudo-perspective; spur-wheel and bevel-wheel in inclined positions; construction of close-fitting worm and wheel; screw-propellor; standard sectionery, etc. The second part of the book is devoted to "Practical Hints for Draughtsmen," the leading object of which is to explain various modes of representation which are in many cases better than the precise ones of projection, for mechanical-drawings often convey false impressions by too close adherence to the truth and become obscure by being too exact. A chapter on drawing instruments is also given. The book, which costs $4, is freely illustrated and handsomely printed and bound. It is a valuable treatise for draughtsmen, embracing, as it does, so large an amount of practical information.

Coast Industrial Notes.

A FOUNDATION is being excavated for at the Kennedy mine, Amador Co., for Superintendent Park's new residence, which is to be a two-story structure. It is to be lighted throughout by electricity.

THE electric-power plant of the Standard Mining Company, at Bodie, is being pushed ahead rapidly. The poles are all in place and appear to be in a dead air line from the dynamo to the mill, a distance of about 12 miles.

CAPTAIN TURNER, the Benicia ship-builder, has launched the largest vessel ever built at his yards. Her deck line is 165 feet, beam 36 feet 6 inches and 16 feet depth of hold. She has a tonnage of 500 tons. She was built for Matthew Turner and others of San Francisco, and her rig will be that of a brigantine.

THE Oceanic on her last voyage to this port from Japan and China brought one of the most valuable cargoes ever brought into port from China or elsewhere, being worth over $3 000,000. Her silk alone was worth $2,500,000, there being 2900 bales. There was also a large consignment of tea on board.

THE Pacific Mail Steamship Company's steamer Peru, which sailed on Saturday for the Orient, carried what is perhaps the largest shipment of treasure which ever left here. In Mexican dollars she took $925,197, in gold coin $14,880, in gold dust $140 and in silver bullion $118,640, making a total of $1,058,857, of which $976,357 went to China.

THE Santa Cruz *Sentinel* says: The bitumen business is very good at present. It is probable that the bitumen plant at Salt Lake will be moved as the freight rate is too high, being $8 a ton from here to that city. Up to the present, 10,000 tons of bitumen have been used in the Mormon capital. The Bitumen Co. is willing to pay $7 a ton, which is all that the traffic will bear.

THE Santa Cruz county lumber market is dull just now, being overstocked. Mr. A. C. Bassett says that it is doubtful whether the Loma Prieta mill will run next year. The company will decide within the next two weeks. They are operating the Ramsey mill, near Corralitos, which will cut 8,000,000 feet next year. When the mill closes down next year it will have cut most of the timber between Hihn's mill and Corralitos.

AT the meeting of the Board of Supervisors of Alameda Co. Monday, bids were received for two new bridges over the San Lorenzo creek, to be built at once. Cotton Brothers were awarded the contract for the bridge over the creek on the road from Haywards to Crow canyon for $4385. The second contract for a bridge over the creek on the road from Haywards to Castro valley was also granted to Cotton Brothers for $3000.

THE works of the South San Francisco Land and Improvement Company at Baden are approaching completion so rapidly that it has been decided to dedicate them on the 25th of next month. The main buildings are already roofed and a new ferry-slip has just been completed. All the grading on the streets has been finished, and the contractor and all his men have been withdrawn. The laying of the tracks from the junction at Twelve-mile house to Magnolia avenue is nearly completed.

THE Giant Powder Company, which has transferred its works to Sobrante since the explosion at Berkeley, will be ready to resume the making of powder by December 1st. Three hundred men have been at work in the construction of the necessary buildings since the middle of July. The new works are located a mile from the station, or ten miles north of Berkeley, making a distance of twenty miles from San Francisco. Since the construction of the works began the little station of Sobrante has been changed in name to "Giant."

AN onyx ledge near Mount St. Helen's, Washington, was recently discovered accidentally by a horse knocking off a piece where it protruded through a trail that has been traveled from the time of the earliest settlement of the valley. It has been prospected far enough to show that it is valuable, one ledge being nearly 30 inches thick and very prettily veined. Samples have been sent to New York and Philadelphia and the replies returned are to the effect that it is worth from $4 to $20 per cubic foot, provided it can be got out in blocks at least 8x12 inches square.

THE Eldorado Milling Company now have their mill in full operation and are turning out a fine article of flour. About two weeks ago they made their first run, and milled several tons of flour, but owing to the break in the ditch, and the shortage of water they were compelled to shut down temporarily. Now, however, the mill is in full operation, with the granary filled with No. 1 wheat, all the machinery working perfectly and a fine stock of flour to denote the successful outcome of the enterprise built up by the determined efforts of a few of the enterprising citizens of the county.

SOME of the Chinese miners on the flat have struck one or two rich finds in operating the mines they have opened there recently, says the Folsom *Telegraph*. Nearly all the old mining ground around here still contains places where gold is plentiful, and many a small fortune has been dug from an abandoned mining claim by Chinese. How many fortunes will never be known, for the Chinese keep such things to themselves always. When a white man makes a big find he tells about it and changes his mode of living, so that it is easy to surmise that he has made a good clean-up, or found a big pocketful of the yellow dust, but the Chinese never do.

E. H. HANSON, of the firm of Wright, Hanson & Co. of this city, has purchased the bark Gay Head in New York, and the vessel is now en route from New Bedford to Patagonia. The idea is to revive the almost extinct industry of South Sea whaling. Nowadays a few vessels of the whaling fleet make a trip as far south as the western coast of Patagonia, but the systematic pursuit of the whale in the South Pacific and South Atlantic has been abandoned for a number of years. As a result, the species has increased rapidly in Antarctic waters, while the hyperborean ocean has been almost depopulated. The Gay Head will call at St. Helena, and will be fitted out for a three years' cruise.

ANOTHER 100 tons of steel rails for the Coos Bay & Roseburg railroad were loaded on the steamer Emily at Mission pier 1 on Tuesday. This is the second installment of 400 tons purchased in this city for the railroad. When the Emily landed the first lot at Marshfield, over 100 men were at work building the railroad, which is being pushed along as fast as possible. There are ten miles of track to be ballasted and the balance of the track laid to Coquille City of 12 miles, which will make 22 miles from that city to Marshfield which will be completed this fall. The trestle 1900 feet across Chinacamp creek, or marsh, is being pushed along with energy. Final lines are being run from Campas valley west by a large corps of engineers.

CHIEF ENGINEER ROCKWOOD, with assistant engineers and sixteen men has commenced the work of surveying the route of the Colorado canal from Castle Dome to Yuma. The canal will take water out of the Colorado river about five miles above Castle Dome, and will extend down to and across the boundary line into the Mexican territory of Sonora and Baja California. The canal will be one hundred miles long and one hundred feet wide, and will carry twelve feet of water. It has an area of excellent land, covering six and a half million acres, upon which it will carry water for irrigation. It is estimated that it will cost $10,000,000 and will take five years time to build it. The capital will be furnished by Colorado men.

FOR the last six months the Southern Pacific Railroad Company has been concentrating all of its broken-down, worn-out, superannuated engines at the yards in West Oakland. There were engines of all sorts and conditions, of every make and of various degrees of beauty. Some looked as though they were as good as any that now make regular trips. Others were ramshackle, rusty-looking affairs that seemed to have come from the bottom of the sea. In all, nearly 100 were gotten together and were placed on various sidetracks in the yards, wherever there was room and where they would be out of the way. Every one was absolutely worthless, so far as the purpose for which they were originally built was concerned. One day last week a gang of men went to work on the old engines and blew them up, one by one, with dynamite, in order to get the old iron and brass in salable shape.

A GREAT deal of work is being done by Adolph Sutro upon the baths near the Cliff House. The foundations of the baths at the base of the cliff and resting upon the beach are completed. These are to be covered with a building containing rooms and all other appurtenances of a bathhouse, to be covered with a glass roof of dome-like shape. From this level a splendid stone staircase divided into three sections will give access to a sanitarium-building, situated 60 feet above the sea-level, and of elegant design and complete furnishing. From the level of the bank to the lower bathhouse two elevators are to be constructed, the whole of which includes a structure 200 feet long and of irregular shape, to be inclosed and protected from the winds. An esplanade will crown the bluff and is to be adorned with statuary and shrubbery. Mr. Sutro also contemplates the erection of a 300-room hotel on the heights of Point Lobos. It is thought that the baths will be in operation in about four months.

Personal.

E. W. CHAPMAN, of the Taylor mine, El Dorado county, is in the city.

MR. GEORGE E. AMES, of the Union Iron Works, has just returned from a trip to Mexico.

W. F. HASSON and J. M. Thompson, mechanical and electrical engineers of this city, have been on a business trip to Grass Valley.

JOHN CURRY and Ed. Stanton, in company with Mr. Newland, are working the Van mine, El Dorado county, on shares. The mill has started up.

THE Sacramento capitalist, Morton Lindley, who recently purchased Lucky Bart's mine on the Sardine creek divide, Oregon, is working a large force on the tunnels and is putting up buildings for his men.

WM. MEIKLE, for several years superintendent of the Bald Mountain Extension mine, Sierra county, has resigned that position. There are at present but few men at work at this mine. Who is to succeed Mr. Meickle has not yet been decided, so far as we know.

ED. MERVINE and John Gibbons, two well-known miners of Mohave county, A. T., have taken a lease on the White Burro claim, in Aubrey district, owned by Harry Mehaffy, of Kingman. The claim is a silver proposition, the ore running in the neighborhood of $300 per ton.

NAVAL Constructor R. W. Steele, who has been on duty at the Union Iron Works for two years past, has been ordered to the Cramps' yard at Philadelphia. Constructor Linnard, now of Mare Island, will oversee the completion of the Monterey and such other Government work as is in hand until a new officer arrives.

W. H. WELCH, superintendent of construction for the Oregon Iron and Steel Company, has been down at San Isidro, Lower California, for the past three weeks, engaged in making a thorough inspection of the Tepustete iron mine and the other iron deposits in its immediate vicinity. He will remain a few days awaiting advices from Mr. Evans of his company, who is negotiating for the purchase of the mine, and Mr. Welch thinks it is more than likely that the transfer will be made. In that event, a force of 100 men, with suitable machinery for extracting ore, will be sent down within 60 days, and business will hum at the now sleepy old landing of San Isidro. Should the Tepustete mine not be purchased, there are other mines in the same region which possess equally as good ore and which the Oregon company may acquire.

Mines and Mining in Nevada County.

By Our Traveling Correspondent.

NEVADA CITY, Oct. 15, 1892.

TO THE EDITOR:—The mines of Nevada county generally group themselves in one of four districts, *i. e.*, Eureka, Washington, Nevada City and Grass Valley. Each district comprises a distinct mineral zone, or, more properly speaking, mineral belt, and so perhaps we should speak of the mines belonging to one of four belts rather than to a more or less arbitrarily determined district—a mere geographical convenience. Within these belts are further geological differences, as strike and dip of veins and local characteristics of country rock, that throw these mines naturally into groups. However, it is only in the Nevada City and Grass Valley belts that this grouping becomes of any considerable consequence, for there is a big difference whether such and such a mine is a continuation of the famed Idaho (and strange to say, mines half a mile either side of the axial line of this lead claim distinction as an "extension" and demand figures accordingly) or whether it is some totally distinct and, probably, cross lead.

Between the first and second of these belts there seems more or less similarity and blending of one into the other, as also is the case (though perhaps in a less degree) between the Nevada City and Grass Valley. Granite is the chief characteristic of the Eureka, as of the Nevada City belt, and syenite, chloritic schists and slate of Washington correspond in a great degree to the Grass Valley formations. But neither Nevada City nor Grass Valley have any connections with Eureka or Washington as far as mineral deposits are concerned.

There are mines, of course, outside the so called limits of these zones; but as the boundaries, as far as extension is concerned, are not fully determined, those "outside" may eventually be found to be "inside," as for example, the Delhi group at Columbia Hill, the most notable of the outside class, is maintained to be undoubtedly a continuation of Nevada City or Grass Valley, whether wisely or otherwise I have not been able to learn.

Of course, the classification here given refers alone to quartz-mining, though a somewhat similar grouping is made with gravel mines, in so far as they may be upon a certain continuous channel. But in Nevada county, with a very few worthy exceptions, gravel mining cuts but a small figure.

THE EUREKA DISTRICT.—This, as with the other districts, receives its name from the principal trade center of the belt, Eureka (South), now known as Graniteville. It is presumable that this belt is continuous with the Alleghany system of ledges in Sierra county. The mines here have not met with the generally uniform success of Nevada county operations. While there have been a few mines operated that have not proven a failure, the majority have not fulfilled the anticipations of the projectors. It has been less the fault of the mines in the cases of these failures than from the natural causes attending mining operations in all localities—lack of capital, poor or dishonest management, generally the most responsible factor, and its twin brother, litigation. Efforts are being made in many cases to resuscitate these dormant enterprises, and with considerable promise of success. It has been unfortunate for the district that there should have been so many undertakings that made no return to the original investors. There are just three claims operating in the district with anything like pretension, and compared with other quartz operations of the county, they seem insignificant. But the largest mines have often had a small beginning, and to this district the success of these three mines is significant.

ROCKY GLEN, owned and superintended by C. D. Easton, was purchased two years ago from Hayward & Co., who never thoroughly opened it up. The ledge, on the contact of slate and granite, averages eight feet in width and is low grade milling. It has a 10-stamp mill, water-power. Work at present is going on in the south drift, 150 feet, and indications are favorable for its proving a very rich and valuable property.

THE CALIFORNIA.—This has a 10 stamp mill also, and is one of the mines that has yielded well, but has been poorly managed in the past. At present, it is under the superintendence of P. Foley, and has been making a good showing, when working the past season, on $10 rock. On the 300-foot level, a tunnel is being driven ahead now to strike the north chute. Ore can then be transported direct to the mill, as now it is necessary to tramway 1000 feet and send it down in a chute, thus saving considerable time and labor.

THE NATIONAL MINE.—This is two miles below Graniteville and is owned by the estate of the late D. R. McKilliken, the man who did more for northern Nevada county mining interests than any one else. Mr. Fred Brown is superintendent, but during his continued absence, an account of ill health, Mr. Dan Powers has charge. The mine is developed by a tunnel, 220 feet in length, on the ledge which has been stoped above. From the end of the tunnel a shaft was then sunk 100 feet. Very recently a large chute of rich ore has been struck, showing a good, continuous, seven-foot vein. This has given splendid and well-deserved encouragement. A five-foot Huntington centrifugal has been doing the crushing with apparent satisfaction. On the hardrock the capacity has been about 20 tons per 24 hours. It is intended to place two more in position immediately. The efficiency of the mill has been greatly increased by the use of the Gates rockcrusher, which pulverizes the rock to any desired degree of fineness, generally the size of a pea, before it enters the mill. It thus saves an immense amount of pounding and wear on the steel rings and dies. The adaptability and advantages of the Gates breaker for all kinds of milling seem obvious, and it is surprising there are not more of them in use. At the National, one of the smaller sizes is used, but it can keep three men busy feeding it, crushing very rapidly and readily taking the largest-sized rocks into its voracious and insatiable maw. In strength and length of wear, it is said not to be lacking. The Taylor mine, 20 stamps and 20 more now adding, El Dorado county, is introducing one of the largest sized. These two are the only ones I have met with.

The water in this mine is taken up by a hydraulic ejector, the invention of Mr. C. T. Rouner, the engineer. It is similar in principle to the ejector or elevator used in river gravel mines, but is made adaptable to shaft-pumping by the introduction of a safety valve in the suction pipe, so that in case clogging of the escape-pipe occurs, the water brought in to furnish power cannot flow back and fill the mine. In shallow workings, it has been used with great success in various portions of the county, Mr. Rouner never having attempted to protect his invention by patent.

These three mines, as before stated, represent the active milling operations of the district. A brief synopsis might be appended of other mines in this belt having milling plants, some of which are for sale, and offer some good chances for the introduction and intelligent use of capital and labor.

NORWAY—First, in the southern extremity and adjoining the Washington district is the Norway 5-stamp mill, water power, idle for past 8 years; for sale, rock said to be hard and ledge small.

RAINBOW—Fine new 20 stamp steam mill; worked intermittently for some time; property of Messrs. Mead and McBean.

THE BALTIC—Fine 20-stamp steam mill, also in the control of Mead and McBean. This was built and the mine just opened by Harvey S. Brown, of San Francisco, who proved the dupe of a dishonest management. The mine has been closed down for two years, but work is now going on preparatory to an early resumption of operations.

THE BOSTON—Owned by Fernback & Co., of San Francisco; splendid new 10 stamp steel mill, water power; idle for nearly two years. Immense sums were spent on an expensive plant and then found there was no mine. The mill is for sale.

THE GAMBRINUS—Is an extension of the California; 10-stamps, steel, 1000 pounds each, water power. While the mill has been idle for the past year or so, Mead and McBean, the owners, have been quietly prospecting the ledge with encouraging results.

THE IXL—Is idle on account of muddled ownership. Eight-stamps, water power free; a large low-grade milling ledge.

THE DUBLIN BAY—Has a 10-stamp mill; is at present bonded to H. C. Callahan of the Eaglebird.

BIRCHVILLE—The 10-stamp mill has been idle for the past 16 years. There is some intention of opening up the old works which have fallen into a dangerous condition. This is owned by Messrs. Parsons and Maybanks of Graniteville.

THE GOLD CANYON mine and five-stamp mill on the Middle Yuba is the property of Mrs. McKilliken, of the National mine. A great deal of money was spent in developments, but with the death of Mr. McKilliken they ceased. The property could doubtless be purchased at a reasonable figure.

THE WASHINGTON DISTRICT—Operations here have a more substantial appearance, as the mines that are now busy have continued active for many years, have plenty of capital behind them, good rock ahead and are ably managed—the main feature in mining after all. This zone comprises a number of ledges, generally striking southeasterly and northwesterly, and supposably connects with the Sierra Buttes system. The east wall of the zone is of granite and the west of slate, while the character of its lode material is generally chloritic schist, which, in turn, in most cases forms the walls of the ledges.

THE EAGLEBIRD—While generally known by this name, it is properly the Diamond Creek Consolidated Gold and Silver Mining Co. Mr. H. C. Callahan is superintendent, a successful operator, a man of scientific attainments and withal a capital host. This mine is near the east granite. The 30-stamp mill has run continuously for many years. The ledge is from 5 to 20 feet in width and the ore is low grade and generally free-milling. Some sulphurets are caught on canvas tables, and shipped to Salt Lake City. These concentrates average about $100, but form only about one-half of one per cent of the ore. The mine is developed by a shaft 700 feet on the ledge, and seven levels besides two upper tunnels running nearly one thousand feet into the mountain. Work is going on in all of the levels except the bottom. The mill and mine are lighted throughout by electricity.

THE YUBA MINE—This is a mile west of the Eaglebird and likewise situated on the south bank of the South Yuba. Mr. George A. Hare is superintendent, a compeer of Mr. Callahan. Messrs. Haggin and Webber, of San Francisco, are the principal owners in the mine, which has worked steadily for the past 25 years. Twenty 900-pound stamps crush about two and a half tons each of hard rock per 24 hours. At the end of a 550 foot tunnel a shaft is sunk 800 feet. From the bottom of this the ledge is worked 700 feet, the stoping for the past year having been confined between the 600 and 800 foot levels. The rock now milling is of medium quality.

GERMAN MINING AND MILLING CO.—This is one of the new enterprises of the county, and is one of the very promising ones too, and of the kind it might well be wished there were more. M. D. Cooley is manager and superintendent of the company, which but recently organized in Rochester, N. Y., and under the laws of West Virginia. For the past two years Mr. Cooley has been quietly developing the mine, which is now sufficiently opened up to warrant the building of a plant. Arrangements are nearly completed for the receiving of a 10 stamp mill, which will be running by next season. It has been necessary to build a considerable stretch of road and a 220 foot bridge across the Yuba, which means a large expenditure of money. The company has recently secured a valuable water-right on the north side of the Yuba which gives 300 feet of pressure.

THE SPANISH MINE.—Mr. David Johnson is superintendent of this mine, which is situated three miles north of Washington. The Spanish is a peculiarity in quartz mining. It has none of the ordinary characteristics, as of a narrow ledge between well-defined walls, worked by incline, etc. The ledge is of soft, decomposed material, varying in width from 50 to 100 feet, all more or less gold-bearing and paying to mill. Consequently the mine is an open cut, with walls of 100 feet or more in height and the width of the lode. The mine is also developed by tunnels, through which work has to be prosecuted in the winter time. Seventy feet below the cut is a tunnel, 500 feet in length, and 200 feet lower still they are running another tunnel, which will eventually be the main operating channel. Preparations are being made for the erection of a 10-stamp mill at the mouth of this tunnel. The mill now on the adjoining (Santa Anita) claim will be removed for this purpose. Likely the Huntington mills will also be transferred here from their present position. Three Huntington's, two of five feet diameter and one of four, do the crushing at present and seem exceedingly well adapted to this soft material. The three have a capacity of about 70 tons a day. The most remarkable feature of this mine is the extremely low grade of the ore. It seldom averages over 80 cents a ton, yet the mine continues to pay its owner well, and a dividend was paid at one time on a 30-days' run of 65-cent rock. The average cost of mining and milling is as low as 50 cents a ton. The main reason why rock of so low a grade can be milled at any possible profit is owing to the manner in which the mine is worked, necessitating the least possible amount of timbering.

A short distance west of the Spanish is the Greystone, a mine similar in character, with parallel ledge. It has also an open cut, which has been washed, and a tunnel 120 feet, from which an incline has been run a short distance. Messrs. Dillon, Snell & Nilon are operating it and intend putting up a centrifugal mill in the spring.

THE WASHINGTON MINE.—This adjoins the German mine on the west. It has a 20-stamp mill, but for the past year both mill and mine have been idle. It is stated that the return of the owner, Baron von Shroeder, from Europe will likely see the resumption of operations. Alf. Tregidgo, the proprietor of the great electric-power scheme of Grass Valley, is superintendent. Without irrelevance it might be added, he is one of the kings of hosts in the row with Callahan and Hare.

THE BLUE JAY, owned by the Eaglebird Co., is opposite the Yuba mine and on the divide of the Yuba river and Canyon creek. It is developed by a tunnel 220 feet north of the vein, disclosing a chute of ore from one to five feet in width and 100 feet long, and milling $15 at the Yuba mine, where the rock is crushed by custom. From the end of the tunnel a winze is sinking 100 feet, whence 100 feet further will be run on the vein. A mill will probably be erected within the next year.

Another new enterprise is broached in this same locality. It is expected that a Salt Lake company will put up a mill soon on the ledge known as the Fritz Meister claim at the mouth of Canyon creek, as they have secured control of considerable mining property in that section lately.

Mr. Henry Kohler of Washington has a couple of prospect mines of merit on the Canyon creek divide known as the Nevada City and Cosmopolitan, and said to be extensions of the Eaglebird. They are each opened by about 200 feet of tunnel. Much of the ore extracted has milled high-grade. These are a few of many creditable openings for the entry of outside capital.

In the North Bloomfield gravel range little is doing outside the Derbec mine and a few small properties at Relief Hill. As all know, here was the greatest hydraulicking operation in the State—the Malakoff or North Bloomfield mine. While there is a range of gravel 14 miles or so in length passing through this section, and available only with the hydraulic process, the probability of its being worked again in that manner is remote, not but that many properties should be allowed to be worked. Prejudice, however, is so strongly intrenched against the great mines here, at French Corral and at Smartsville, that restrictions under which they may be permitted to run are likely to prove prohibitive to both big and small mines in this vicinity. It is not the small hydraulic claim that has caused the trouble in the past, and it is still more unlikely to be of injury in the future, for the lesser properties are easily capable of restraining and holding within proper bounds their own tailings. Future legislation should look particularly toward affording relief to the numerous and far more deserving class of small hydraulickers.

DERBEC GRAVEL MINE.—This is and has always been the leading drift mine of this section. Theodore Wetzel, the superintendent, was conservative in his statements regarding the present developments going on in the mine. The work of opening up new ground has called for assessments, but prospects look favorable to an early resumption of dividends. For the past two years, drawing the pillars has continued. From the bottom of the shaft, which is 470 feet deep to the bedrock, a 400-foot drift is being driven, which is expected to strike the back channel.

AT RELIEF HILL, four miles east of North Bloomfield, less is doing than the possibilities of the place naturally demand, as the operators are generally poor men, heretofore unable to open the ground properly. The principal property is the Union mine of C. O. Jepson. The mine is opened up by about 2000 feet of tunnel into the channel, is working about 20 men, and reported paying well. East of this is the echo, as yet undeveloped, and owned by Messrs. O'Connor and Morrison. The Waukesha of W. O. Williams is a promising property. It has a 1500-foot tunnel. New machinery has lately been purchased, and it is intended to put on 25 or 30 men at once.

THE DELHI MINE is situated at Columbia Hill on the banks of the middle Yuba. Mr. Robt. McMurray of San Francisco is the owner; Chris Malon is superintendent. The upper levels being exhausted, work is now going on in No. 4, where a point but 80 feet from the river has been reached. In consequence, an immense body of water, amounting to 50 inches, is pouring into the mine, which is a source of inconvenience. A hydraulic pump, similar to

that used in the National mine, is here in use. Within a very few weeks a rich strike has been made, which will probably warrant the introduction of new and heavier pumping machinery, etc. The 18-stamp mill is kept generally busy. The ore is mostly free-milling, though the company has eight concentrators and its own reduction works. One thousand feet west the same company is developing a parallel ledge. There are several good prospect mines in the immediate vicinity, as the St. Gothard, owned by the Nevada City Champion Co. It has steam-hoisting works and a shaft to some depth. The Grizzly is another. Just across the river is the King Solomon, owned by a Grass Valley company, which is preparing for the erection of a ten-stamp mill. I will send you further notes next week.

CHAS. E. TOWNSEND.

The Gustin Belt.

SAN FRANCISCO, Oct. 15, 1892.

TO THE EDITOR:—In an article written a short time since for the MINING AND SCIENTIFIC PRESS, entitled "The Age of Gold," I referred to the Gustin belt as a placer mine which was formed at a very early geological age, and in the article referred to promised to write something more concerning this interesting deposit.

The name "Gustin belt" is applied to an extensive conglomerate bed found in the Black Hills of south Dakota, and is confined to that portion of the deposit occurring in the northern part of the Black Hills, and particularly to that portion which lies to the northeastward of the famous Homestake mines, and is still further limited to that portion which is gold-bearing and that has returned large amounts of gold in the process of mining.

The nucleus of the Black Hills consists of a broad series of mica schists, quartzites and other metamorphic rocks of archæan time, uplifted at a high angle usually, with a prevailing dip to the northeastward. Local exceptions occur, and in the western hills, in a comparatively limited area, the rocks dip slightly to the westward. The strike of these rocks is generally northwesterly and southeasterly.

That these highly altered strata were formed from preexisting rocks there can be little doubt. Many of the quartzites and micaceous sandstones still show that they are of fragmental origin. There has been an almost universal opinion that the archæan terrane in the Hills was exposed without a fold for 25 miles across the uplift, representing consequently this immense thickness of formation. This, however, is not the case, as there is clear evidence of folding in the argillites on Rapid creek, a few miles above the town of Pactola.

In Cambrian time certain portions of the archæan rocks were standing above the surface of the ocean that surrounded them, either as a single island or several of them, forming a group. The crystalline rocks were disintegrated and the detritus carried down into the ocean. In many parts of the Hills the ancient shore-lines are remarkably distinct, being marked by extensive deposits of conglomerate made up of the bowlders, pebbles, sand and mud derived from the wasting and tearing down of the archæan formation.

This conglomerate, together with thousands of feet of younger strata, has been eroded over large areas, and the numerous exposures or outcrops are not found in a continuous bed, though there is no question but that they once formed an unbroken bed over large tracts. In two places in the Hills the conglomerate is gold-bearing—one at Rockerville, in Pennington county, and the other in the Homestake region. There may be other occurrences of gold-bearing "cement" in that county, but I am not familiar with them. It is of the Gustin belt I will speak more particularly.

Commencing in a region about three miles northwest of the city of Deadwood, on a tributary of Polo creek, the cambreo-silurian conglomerate is exposed by the erosion of the canyons. It lies unconformably on the upturned archæan and is covered conformably by a thick bed of dense quartzite which has mostly undergone recrystallization. Above this are found a succession of shales, sandstones, impure limestone and sheets of intrusive rhyolite. This portion of the Hills is greatly disturbed by local uplift and the faulting and folding of the strata, caused, no doubt, by the intrusion of the eruptive rocks.

The conglomerate at the point referred to is about five miles distant, perhaps a little more from the nearest portion of the Homestake belt, but gold is found in the conglomerate, and a recent placer has formed in the canyons which have cut down through the conglomerate. The economic results of operations I believe have not been satisfactory.

Coming southeasterly toward the Homestake, the conglomerate bed is found at intervals in the immediate neighborhood, but in the vicinity of City Creek it is lost, great masses of porphyry constituting the entire formation. Whether it has been uplifted and eroded or whether the conglomerate still lies beneath the eruptive rocks, I am unable at present to say. In Blacktail gulch, however, it reappears in the Gustin, Bessie, Esmeralda and other mines, cropping along both sides of the canyon. Here the deposit has been worked extensively and is reputed to have produced over $2,000,000.

The placer mines in the gulch below all paid handsomely, as they did in all other gulches in the vicinity where the conglomerate has been eroded.

Continuing southerly, we find the Wooley, Pecacho, Hidden Treasure, Keats and Aurora mines between Blacktail and Deadwood gulches and the Alpha, Great Eastern and one or two others on the south side of Deadwood gulch, near the Deadwood and De Smet mines. All of these mines were rich and where managed properly returned handsome profits to their owners.

Farther to the eastward the High Lode, Queen of the Hills and some other claims are located near the Caledonia mine, now one of the Homestake group and also in archæan rock.

It must be understood that broad canyons have been cut down through the conglomerate and far into the archæan in many places, resulting in separating this once continuous belt into segregated areas half a mile or more apart.

Crossing the broad belt of gold-bearing chloritic schists and quartz constituting the Homestake belt to the southward, the conglomerate is again found in the Durango mine, and only 600 or 700 feet from the Homestake mine, but though identical in every particular lithologically with the mines of the cement belt north of the Homestake, the Durango, the nearest claim to the great mine, has never paid.

The conglomerate extends for miles to the southward, far beyond the Homestake, and finally passes out of sight beneath the later formations on its dip to the southeastward.

The only conclusion, in view of these facts, is that the Gustin belt has derived its gold, in great part, directly from the Homestake group of mines; that the currents or waves came from the southward and in time covered the source of the gold, the sea retreating evidently to the southeast as the conglomerate shore-line formed. The deposit appears to me to possess all the characteristics of those formed on rocky shores of the oceans of to-day, and not to have resulted from river currents as has been frequently asserted. The gold is mostly found on bedrock and in places was very rich, but it was also found scattered through the overlying material to depths varying from two to ten feet. The rock is very hard and cemented by siliceous material. It is worked in quartz mills the same as the rock from the quartz mines.

The Gustin belt forms one of the finest geological studies found in the Black Hills region, which abounds in typical geological phenomena, and its economic importance tends to give the deposit even greater interest.

On or near the South fork of Castle creek in the southern hills, this Cambrian conglomerate occurs, resting, like the Gustin belt, unconformably on the archæan rocks, but at this point it carries native copper with limonite and is extremely hard. The deposit is but two or three feet in thickness. Its lateral extent has never been proven. The overlying formation is a coarse, friable sandstone which disintegrates rapidly, giving the hill a rounded, smooth appearance. On the main Castle creek, about three or four miles above Mountain city, the deposit is from 20 to 30 feet in thickness and seems to be loose and incoherent, the only cementing material being a little infiltrated calcite.

Over broad areas the contact of the Cambrian and archæan is marked by a heavy bed of quartzite without included pebbles or bowlders, showing it to have been deposited at some distance from the shore, in deep water.

W. H. STORMS, E. M.

THE belt railroad around the water front of San Francisco is gradually being extended westward. The Harbor Commissioners have arranged for an extension from the foot of Francisco street to Powell on a single track. The contract has been let to Healey & Tippetts for $2400, the State furnishing all rails and fastenings and everything with the exception of ties. A change has been made in the construction of this part of the road by Engineer Holmes. Instead of plank crossings for the streets the rails will be laid on heavy steel chairs, which will allow the crossings to be paved or laid with hasalt blocks. A locomotive is already running over the old track, and all the freight from the North Pacific and South Pacific Coast—that is, all the terminal freight—is now handled in the yard of the belt railroad at Front street. The new Powell-street wharf is provided with track-stringers, so that at any time the road can be extended on to the wharf. In this way, lumber or other freight can be handled direct from the ship. The extension is expected to be completed within two weeks. There is only half a mile of single track and 20 men are engaged on it.

THE "Chappelet franchise" was originally intended as one for building an electric road from Haywards, Alameda Co., to San Jose, Santa Clara Co., but it could not get entrance to the latter city. The gentlemen interested are now arranging for a new combination that will result in the construction of 17 miles of road and its operation. They now hold franchises in Alameda Co. running from Haywards to Niles, and thence down to the Santa Clara line on the way to San Jose, where they proposed to end their road. They then secured a franchise down toward the bay, taking in Alvarado and cutting back toward the main line, taking in Centerville, Irvington and the Mission San Jose. It is now proposed to construct this latter line, and thus put the towns of Centerville and the Mission San Jose in direct communication with Oakland, these towns now being away from the main line of the steam roads. The holders of the franchise are looking for a bonus, however, and would put this line of road in operation for about $15,000 or $20,000, to be paid by the property-holders along the route.

THE President of the Southern Pacific has decided to at once push the work of filling the gap on the coast division between Santa Margarita and Ellwood. When completed, this will make another through line between this city and Los Angeles, via. San Jose, Castroville, San Louis Obispo, Santa Barbara and Sanger. There is some heavy tunnel work immediately south of of Santa Margarita, and that will be commenced first. The right of way given to the company after running through the mountainous country for a distance of about sixteen miles between Santa Margarita and the town of San Louis Obispo extends almost due south from the latter place, crosses the Santa Maria river in the vicinity of Canada de las Pinos Ranch, thence through the Gaviota pass, and then westerly to the shore of the ocean, a number of miles northwest of Elwood. Only a part of this route may be used, as the company has made another survey further west with the idea of avoiding the Gaviota pass and the grades through the San Rafael mountains.

The Mule.

The hybrid animal which is part horse and part ass evinces, more than any other such cross perhaps, all the distinguishing characteristics of both the parents. He has all the good qualities of the horse, some, however, being modified by the interfering tendency of those of the ass. Thus he has the strength, size and form, with much of the sagacity and docility of the dam, and the obstinacy, in good as well as bad, of the sire, with his hardiness, longevity, surefootedness, untiring patience and robust constitution. A mule is said and thought to be extremely obstinate, proverbially so; but this quality in this animal has its most useful development, for to it is due the fact that a mule never balks, but persists in pulling until he lies down for inability to use another muscle. It begins work earlier and continues longer by several years than a horse; it is rarely ever sick, and, generally, unless wofully misused, has nothing the matter with it from the time it begins to work at three years old until it is discarded at the age of 40. Mules have been known to live and work more than 40 or 50 years without any rest by summer-pasturing, but constant tugging of heavy loads on mountain-roads throughout the entire years. Their digestion is remarkably strong, and their appetite is easily satisfied. In the absence of its usual corn and blade fodder, it will most contentedly make a meal of the bark of a tree cut for the purpose on the roadside, where the driver camps at night after 25 miles of heavy pulling, with no bed but the ground and no roof but the starry infinite above. In cold and heat, rain or snow, in mud or over rocks, it wends its way without a break or an objection, and brays for its coarse fodder and eats it with excellent appetite wherever it may stop for its short rest. The mule is no racer, but it may be trained, says Henry Stewart in *American Agriculturist*, to travel under the saddle or in light harness at a very good speed, and it will maintain its pace for ten or twelve hours with more steadiness than a horse. Its compact build makes it the best pack animal. The horse is the more luxurious animal and more human in its disposition. Its nerves are more acute, it has higher instincts, and is more refined. It is kinder in disposition, and is more easily and strongly attached to its keeper and owner, who uses it kindly. It can make a more vigorous effort on the spur of the moment, but cannot maintain a slow, dogged energy like the mule. It requires more food, and that of a better quality for these reasons.

Where quick work for a short time is wanted, the horse heats the mule; but for the slow draft and unchanging toil, the mule is the more useful. A mule is kept one-half more cheaply than a horse. It may be fed on blade fodder and a few ears of corn day after day without any change, and will do more work on this coarse fare than a horse of 200 pounds more weight. This character is so well fixed that in the South, where all the hard work is done by mules, a mule of 1000 pounds is worth $100 or $150 more than a horse of the same weight, and for smaller animals the difference in value is $50 in favor of the mule. For a few years past I have been rearing young mules and horses, and while the colts get the best hay and more grain, the mules get corn fodder, the coarse hay and few corn ears. An accurate account of the cost of feeding the two kinds of animals up to three years old shows that the mule may be reared for half the cost of a horse colt. A pair of small mules cost me less than $20 a year for the two years they were fed, and they lived during the summers in a wood lot, and cost nothing for their pasture. A mule will live where a horse will starve, and, when out of work, enjoys the coarse feeding of the woods. When the horses come to the gate and wait to be brought home for their feed, the mules have to be hunted up, and bells are put on them so that they may be found. On the whole, I am very sure that a pair of mules will do twice as much work as a pair of horses the same size, or somewhat larger, at half the cost of feed and other expenses. This takes into account the feeding, the work and the longer life. Much is said about the ill-nature of a mule. This is undeserved. Its frequent viciousness is taught to it by ill-treatment and general bad management. A mule will never kick unless it has been taught, except in frolicking when young. It is really affectionate and good-natured, and when otherwise it gives only what it gets. When kindly treated from the first by those who rear it, the mule will be kind, docile and even affectionate. It will not be so demonstrative of its affection as a horse as kindly trained, but it will show its good nature in its own more sober manner. The horse is a subject for the poet, the mule for the man whose life is spent with a freight-wagon or a plow before him.

BY January 1st there will be five new electric roads in operation in Oakland, and upon all of these roads work is now being done. The Fourteenth-street electric road is completed with the exception of a little electrical work. It will be put in operation in about two weeks. Cars will run down Clay street and up Washington, and there will be no double tracks on either street. The Oakland, San Leandro and Haywards Company is pushing its line into Oakland from the present terminus at Thirteenth avenue. It has secured permission from the Piedmont Cable Company to run down Clay street. The line will be in operation by the 1st of November. E. P. Vandercook of the East Oakland electric road says that his line will be in operation by the 1st of November. The Telegraph-avenue line will be running by the 1st of January. The wires are now being strung and the cars are being sent from Newark to the carhouse at Temescal, where they are being fitted with motors. Work has been commenced in West Oakland on the line of the Consolidated Electric Company's line, down Eighth street and out Peralta street to Berkeley.

THE underground force employed in the Yellow Jacket, Crown Point and Belcher mines on the Comstock, was increased on Saturday by the addition of 100 men. The increase is due to the recent rains swelling the Carson river's flow so that the stampmills operated by it can resume crushing.

Mechanical Progress.

Electric-Light Carbons.

The French Vice-Consul at Nuremberg, M. Leon Duplessis, has recently made a lengthy report on the electric-carbon industry of that town, from which the following extracts are taken:

"The manufacture of electric-light carbons occupies six large factories, belonging respectively to C. Conradty, Ch. Shmelzer, Carl Braun, J. G. Meier, Emile Mahla, and Jules Fuchs. To these may, perhaps, be added a seventh, namely, that of Dr. Albert Lessing, though the latter does not produce carbons for electric-lighting, but only battery carbons.

"The raw material employed in this manufacture is 'retort graphite.' As far as the vice-consul was able to discover, this material only is used when homogeneous carbons are required; but when cored carbons are to be made a softer substance is added. Before they are ready for use, homogeneous carbons pass through twelve, and cored carbons through sixteen, different processes. The first operation is to break the graphite into small nuts. For this purpose a three-stamp mill is used. The stamps, in falling, crush the graphite placed over movable steel gratings that allow the broken material to pass between their bars. These bars are placed nearer to one another, or farther apart, according to the size of the pieces required. Having passed this grating the pieces are collected by hand and passed through a sieve. The coarse particles are submitted to a vertical crushing, and the fine are passed on to a rolling-mill. The vertical crushing is intended to reduce the pieces of graphite to about the size of semolina grains. The graphite thus treated is directed a second time into a sifting machine. Then follows more rolling. The sixth operation is to damp and mix the graphite obtained from the rolling-mill, as well as the powder gathered in the sifting machines, with a binding substance. The mass delivered from this machine being too soft, it is necessary to render it plastic and capable of taking a shape, and with this object it is consigned to a sort of puddling machine which produces a species of paste. This paste is pressed through a machine fitted with dies. These produce coarse rods or other pencils, according to the diameter of the cylinders. The rods so prepared are introduced into steel hydraulic cylinders and submitted to a pressure of about 25 atmospheres. Some of these hydraulic presses—the construction of which the Nuremberg manufacturers have only attained by successive steps—can deliver 500 metres of carbon per hour, or from 2000 to 3000 arc-light carbons of average size. All these operations terminated, the carbons obtained are baked in a blast furnace where the temperature occasionally attains as much as 2000° centigrade. When homogeneous carbons are withdrawn from the furnace they have only to be passed on to an automatic cutting machine. This machine is in direct communication with a ventilator which draws off the powdered carbon produced in cutting.

"The construction of machines employed in the manufacture of electric-light carbons is also a Nuremberg specialty, and the house of Justus-Christian Braun has a monopoly of the business, and supplies machines in Europe and America. The cost of an outfit for a factory is put at 20,435 marks, irrespective of packing, transport, and customs charges."

Waltham Watch No. 6 000,000.

The American Waltham Watch Co. has just completed, ready for delivery, watch movement No. 6,000,000. The event marks an epoch in the history of this concern worthy of more than passing notice. The timepiece is the highest-grade nickel movement made by the company, new thin model, 16 size, ¾-plate, open face, and has all the latest improvements, including the Church patent pendant settings and stem-winding device and Church's patent micrometric regulator and Logan's patent Breguet hairspring. The train-wheels are gold, beautifully polished, and the jewels are the finest red ruby in raised gold settings. The most striking feature is the ornamentation of the plate by one of the company's best damaskeeners, and this work is undoubtedly the most beautiful and elaborate that ever was put on a watch.

The growth of the business of the American company since it commenced the manufacture of watches is well marked by the following figures: Watch No. 1,000,000 was completed in 1877, twenty years after Treasurer Royal E. Robbins purchased the plant. Watch No. 2,000,000 was finished in 1882, and the event was commemorated by the first foremen's supper. Watch No. 3 000,000 was delivered in 1886, and was presented to the Foremen's Association by the company, and it has since been carried by one of the foremen, being drawn by lot at the annual supper. Watch No. 4,000,000 was completed in 1889. Watch No. 5,000,000 was made for Treasurer Robbins and was finished in 1891. From the above it will be seen that it took 20 years to make the first million watches, 5 years for the second, 4 years for the third, 3 years for the fourth, 2 years for the fifth and about 18 months for the sixth. In completing this watch, the American company has made one million more watches than any concern in the world.

In such a vast establishment there is constantly in course of construction several hundred thousand watches, and a few days since the movement bearing the significant figures "6,500,000" was commenced.—Waltham Free Press.

Shop Hints.

To cut a gear wheel of an unusual size, pitch, or tooth-shape, sometimes bothers the average shop, which is equipped only with the standard cutters such as are furnished by two or three firms which have had the good sense to make their system of tooth curves uniform, so that every spur wheel of the same pitch will mesh with every other cut with the same set of cutters. Then again, some shops have no large milling machines; some have none at all; so even if they have the cutters they might not be able to use them. Again, it does not always pay to get a set of cutters for a job which may never have to be duplicated.

For such work it is very often perfectly feasible to use a slotting machine with a cutter of the shape of the tooth-space. The wheel or rack blank is first carefully graduated into the requisite number of divisions, if there is no graduated chuck on the slotter; then is bolted fast to the slotter-bed or table and a scribe mark made on the latter to correspond with one of the division marks on the edge of the wheel blank. Then the tool is set to work until a tooth-space is cut; the wheel is then turned or the rack slid along until the second division mark on its periphery or edge is in exact line with the scribe mark on the slotter-bed, and a second space cut, and so on.

It is well not to do all the work with one tool, but to have a rough cut taken for each space with a tool which will make the approximate outline, and then to finish off with one filed or ground exactly to the requisite outline.

For this class of work, as for many others, chilled cast-iron teeth will be found very desirable, as they keep their shape and take greedy cuts, and may be made of a special outline, such as that required for tooth-space cutting, more quickly and more cheaply than by forging.—Cincinnati Artisan.

SMELTING IRON SANDS.—It is stated that Mr. E. M. Smith, the member of New Plymouth (New Zealand), has been conducting some further experiments regarding his process for smelting ironsand, in the course of which a blast furnace at Onehunga was charged with the ironsand in the shape of bricks instead of with iron ore. A tapping took place, and the result was that several tons of ore were obtained from the furnace. The metal was pronounced by experts to be workable iron of first-class quality, far superior, in fact, to that hitherto produced from any of the New Zealand ores. A portion of the molten metal was converted into small castings, among which was a barrow wheel, and it stood this test in a highly satisfactory manner. The "bricks" with which the furnace was charged consist of an admixture of ironsand and clay, and were brought by Mr. Smith from New Plymouth, where they were manufactured 15 or 16 years ago. A further quantity, made of similar materials, has just been brought to Onehunga from the Avondale Brickworks, and is now being used to feed the furnace. Mr. Smith claims that the yield of iron is equal to 50 per cent of the weight of the bricks, and be is sanguine of being able to produce iron of a high class at a payable rate. Coke from the gray coal was used in the trials, and there being at the time a scarcity of limestone at the works, shells were used in its stead. Two truckloads of Kamo limestone have, however, recently come to hand, and will be used in future operations. The trials have been watched with great interest by the Onehunga people, to whom the development of the industry is of much importance, seeing that the west coast abounds with inexhaustible quantities of raw material in the shape of the deposits of ironsand.

Scientific Progress.

The Volatilization of Quartz.

It is not very long ago, says *Industries*, when the fusion of quartz was considered to be a feat sufficient to warrant a good deal of interest being displayed in the mode of manufacture as well as in the electrical properties of the quartz fibers with which the name of Mr. Boyes became so intimately associated. Now we have gone a step farther, and soon not only the fusion, but the distillation of quartz may become an every-day occurrence. Dr. Serger, the well-known German ceramic technologist, and editor of the *Thonindustrie Zeitung*, has published a paper in which he claims to have volatilized quartz in an appreciable quantity. It was noteworthy that the furnace employed was by no means a particularly sensational instrument. One would have expected that for an undertaking of this kind the very latest variety of electric or oxygen injector furnace would have been used, but the furnace actually chosen was of an older and more conventional type. It was of what is known as the Deville pattern, and consisted of a simple cylindrical sheet-iron case lined with dead-burnt magnesite, leaving an internal cavity of about five inches diameter and 11 inches high. The magnesite lining only extended about two-thirds the length of the cylindrical casing, which was divided at that point by a perforated iron plate, forming the floor of the furnace proper and supporting the crucible.

Below this division was the air chamber, into which a blast was injected by a side opening, and which served for the preliminary warming of the air before it came in contact with the burning fuel. The crucible was of carbon, and was inclosed of another of magnesite. The fuel used was retort carbon, and was kindled by a few fragments of burning charcoal. The quantity of the former used was 4 kilogrammes, which is certainly a very moderate expenditure. After the experiment it was found that the quart had undergone fusion, to judge by its appearance, and was noticeably smaller. When weighed, it was found to have been reduced to the extent of over 40 per cent, the total mass taken being 2.5 grammes, and the quantity that had disappeared amounting to 1.1 gramme. That this was in no sense due to accident was proved by repeating the experiment with another piece of quartz, with a precisely similar result. The comparative constancy of the loss might lead to the supposition that there was some limiting factor in the volatilization, but a second heating of the same test piece caused a further loss of about 15 per cent of the original weight, and on repeating the heating twice the piece of quartz vanished altogether.

It was observed in the course of the experiments that when the quartz was cooled rapidly it had an opaque, porcelain-like aspect, while when the cooling took place gradually the test piece was perfectly transparent. The results we have recorded are sufficiently startling, and if they had emanated from a less careful technologist than Dr. Seger, would be regarded with some doubt. Even as it is, one cannot help wishing that further details were forthcoming, to set at rest the supposition that some of the basic material with which the furnace was lined may have obtained access to the inner vessel, and by fluxing the silica have rendered it sufficiently fluid to soak into the substance of the crucible. The one way to clinch the matter is to ascertain whither the lost silica goes—in fact, to turn the volatilization into a true distillation. Who knows, when silica is fractionally distilled, of what homologous, but not identical, bodies it may not prove to be composed.

A PETRIFIED FOREST.—F. B. Schemerborn, Geologist of the Idaho World's Fair Bureau, who recently discovered the great glaciers in Idaho county, has found a fossil forest in the center of Custer county. In the same locality he has discovered the petrified bones of a now extinct race of men and animals, which will be sent to Chicago. The forest covers an area of four square miles and the condition of the ground shows that at one time an enormous flow of clay which worked in from the northwest has buried the tree trunks to a great depth. This clay has turned to stone and no one can ascertain its true depth without going to great expense. All the trees in this forest have their tops broken off and stand from 10 to 40 feet above the ground, averaging about 28 to the acre. Schemerborn took the exact measurement of some of the trees and found them to average 12 feet in diameter on top and 16 feet in diameter at the surface of the ground. How far the trunk reached through the clay stone to the soil he had no means of ascertaining. A branch which had become detached from a tree and was lying about 16 feet from it was three feet in diameter. From the size of the trees and their branches Mr. Schemerhorn thinks they are a species of redwood such as is found in California and attributes their fossilization to the clay, which, bearing a large part of mineral and presumably coming from some volcano, soon turned the living trees into monuments of stone.

A New Aluminum Process.

A private exhibition to a few interested capitalists was given recently of the new process for making aluminum invented by Col. William Frishmuth, at the laboratory of the Enterprise Aluminum Co., Rush and Amber streets. The process is partly chemical and partly electrical, the aluminum oxide being extracted from pure clay and dissolved. The solution is then exposed to the electric current, which causes the pure metal to be thrown down on brass plates. From this it is removed by an ingenious but very simple chemical process in a state of almost perfect purity and in the form of a silvery impalpable powder. It only remains to smelt it into ingots. Col. Frishmuth estimates that the aluminum can be extracted at a price far below its present market value and in any desired quantity. But a singular circumstance connected with it is that the byproduct or residue from the chemical treatment of the clay possesses high value as a fertilizer, and this, it is claimed, will be sufficient to pay all the expenses of the operation. An analysis of the byproduct, made by an expert chemist without knowledge of how it was produced, was submitted. He estimated its value as a fertilizer at from $8 to $10 per ton.

A charter has been procured and a company formed which will immediately proceed to manufacture the metal commercially. It is designed to operate the first plant in this city for a time, the clay being brought here from New Jersey, where a bed free from deleterious substances is found. The promoters are so confident of success that they think that in a short time the profits will enable them to put up extensive works in the immediate vicinity of the beds.—Philadelphia Ledger.

Testing Gas with a Hydrogen Flame.

At a recent meeting of the British Association, Prof. Clowes, of University College, Nottingham, described the application of a hydrogen flame in an ordinary safety lamp to the detection and measurement of inflammable gas or vapor. *Engineering* (of London), in its account of the meeting, says:

The coalminer detects and measures roughly "fire-damp" in the air with the help of the "cap" over the flame. The ordinary oil flame does not with certainty detect less than 3 per cent of fire-damp. Pieler's alcobol flame indicates 0.25 per cent readily, but gives no light, and can be used for gas-testing only. The Ashworth lamp, which Dr. Clowes showed last year at Cardiff, and which burns benzoline, detects 0 5 per cent of fire-damp when the wick is pulled down until it gives a pale blue flame only. He now described a miner's lamp in which the ordinary flame can at once be replaced by a hydrogen flame, which indicates and measures from 0.25 to 3 per cent of fire-damp. As soon as the delicate testing is finished, the ordinary flame is kindled and can be used for either illumination or for detecting higher percentages of fire-damp. The hydrogen gas is carried in a small steel reservoir slung over the shoulder by a strap, and is introduced through a fine metal tube terminating in the interior of the safety-lamp near the wick. The "cap," produced by air containing 1 per cent of coal-gas, was four times as high, and half as high again, respectively, as the "caps," over a benzoline and an alcohol flame of the same height. The hydrogen safety-lamp is also specially suited for spaces in which petroleum oil has been stored, where naked flames have caused many an accident; it detects 1-20th of the amount of petroleum vapor which can be kindled in the air, and 1-30th of the amount which explodes when mingled with air, as Dr. Clowes ascertained from experiments in his test-chamber.

THE Siemens & Halske Co., of Chicago, an American branch of the famous Berlin firm, has taken a contract for what is claimed to be the largest isolated electric plant in existence, that for the Auditorium building in Chicago, and its new annex across the street, Congress Hall. The original Auditorium plant was of Edison manufacture, and this will be removed and the Siemens & Halske plant substituted.

Founded by Mathew Carey, 1785.

NEW DISCOVERY.

Mines Revived and Miners Enriched

By the wonderful **MacArthur-Forrest Process**, Controlled by The Gold and Silver Extraction Mining and Milling Co. H. A. W. TABOR, Pres.; LEONARD GOW, V. Pres.; H. A. JONES, 2d V. Pres.; P. GEO. GOW, Technical M'g'r. and Ass't Treas.; T. L. WISWALL, Gen'l M'g'r. and Sec'y; PETER MCCOURT, Treas.; W. L. COOPER, Eng.

DENVER WORKS: On the D. & R. G. R. R. near the Broadway Electric R. R. Depot.

TRADE MARK.

(MACARTHUR-FORREST PROCESS)

GLASGOW WORKS: The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Queensland, Etc.

General Office of Company:

Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: Denver; The Livingstone Gold Mining Co., Boulder Co., Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co., Cal; The Shasta Gold Ex Co., Middle Creek, Shasta Co., Cal; The Mercur Gold Mining Co., Fairfield, Utah; The Pacific Gold and Silver Extraction Co., Oro Grande, San Bernardino Co., Cal.; The Ora Bella Mining Co., Yavapai Co., Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co., Ravenue via Norris, Mont; and others in course of erection.

The object of this company is to introduce the Mac Arthur-Forrest process.

We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.

If you desire an experimental test communicate with the secretary.

If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons in Denver.

We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.

The process consists of pulverizing the ores to a fineness of about 50-mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tuns especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.

The total cost, as as rule, does do exceed from $2.50 to $5.00 per ton.

The most desirable class of ores for this process are the so-called refractory gold, ores pyrites, hematites, manganese and tellurium. We have also treated successfully dry silver ores.

We will be pleased to answer any inquiries and furnish any desired information. Address,

T. L. WISWALL,

P. O. Box 926. Gen. Mgr. and Secretary.

QUARTZ SCREENS

A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

The Best Mining District

On the Pacific Coast!

GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is

THE TIDINGS.

Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.

Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.

DAILY, $6.00 a year; WEEKLY, $2.50, *in advance.*

STAMP SHOES. STAMP DIES.

Adamantine Shoes and Dies —AND— CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

THESE CASTINGS ARE EXTENSIVELY USED IN ALL THE MINING STATES and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to above conditions. When ordering send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent, 220 Fremont St., San Francisco.

Special attention given to the purchase of Mine and Mill supplied.

Stamp Cam

REMINGTONS AT THE COLUMBIAN EXPOSITION.

The Remington Secures the Exclusive Contract.

The Committee of Ways and Means of the World's Columbian Exposition has awarded to Wyckoff, Seamens & Benedict (Remington Standard Typewriter) the contract for furnishing all the writing machines to be used on the Exposition Grounds during the Fair. A large number will be placed at convenient points throughout all the building's, and are intended for the accommodation of the general public, representatives of the press, and the officers of the Exposition.—*Chicago Sunday Herald, Aug. 7, 1892.*

The World's Fair Commission already use over 100 REMINGTONS in their own work.

G. G. WICKSON & CO.,

37 & 5 Front St., San Francisco, Cal.

THE RUSSELL PROCESS.

For information concerning this process for the reduction of Ores containing precious metals, and terms of license, apply to

THE RUSSELL PROCESS CO., Park City, Utah.

TUBBS CORDAGE CO.

(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal.

WELL MACH'Y *All Kinds, Water, Gas, Oil, Mining, Ditching, Pumping, Wind and Steam; Heating Boilers, &c. Will pay you to send 25c. for Encyclopedia, of 1500 Engravings.* The American Well Works, Aurora, Ill. also, Chicago, Ill.; Dallas, Tex.; Sydney, N. S. W.

Useful Information.

Durability of Stone.

The physicial properties which contribute to durability of stone are the hardness, toughness, homogeneity, contiguity of the grains, and the structure, whether crystalline or amorphous. Although hardness (resistance to crushing) is often regarded as the most important element, yet resistance to weathering, does not necessarily depend upon hardness and the nonabsorbent properties of the stone. A hard material of close and firm texture is, however in those qualities at least, especially fitted to resist friction, as in pavements and roadmetal and the wear of raindrops, dripping rainwater, the blows of waves, etc. Porosity is an objectionable element. An excessive porosity increases the layer of decomposition which is caused by the acids of the atmosphere and of the rain, also deepens the penetration of frost, and promotes its work of disintegration. If the constituents of a rock differ greatly in hardoess, texture, solubility, porosity, etc., the weathering is unequal,, the surface is roughened, and sensibility of the stone to the action of frost is increased. The principle which obtains in applying artificial cement, such as glue, in the thinnest film in order to secure the greatest binding force finds its analogy in the building stones. The thiuner the films of the natural cement and the closer the grains of the predominant minerals, the stronger and more durable the stone. Of course the farther separation produced by fissure, looseness of lamination, cavities, and geodes and excess of mica teods to deteriorate still further a weak building stone. Experience has generally shown that a crystalline structure resists atmospheric attack better than an amorphous one. The same fact is generally true with the sedimentary rock also, a crystalline limestone or good marble resisting erosion better than earthy limestone. A stone that is compactly and finely granular will exfoliate more easily by freezing and thawing than one that is coarse-grained. A stone that is laminar in structure absorbs moisture unequally, and will be seriously affected by unequal expansion and contraction, especially by freezing and thawing. Such a stone will gradually separate into sheets. A stone that has granular texture, as constructed with one that is crystalline or fibrous, will crumble sooner by frost and by chemical agents, because of the easy dislodgment of the individual grains. The condition of the surface, whether rough or smooth, influnces the durability, the smoother surface being the better. The stone is more durable if the exposed surface is vertical than if inclined. The lamination of the stone should be horizontal.—Operative Builder.

How They Moved Obelisks.

The obelisks of the Pharaohs are made of red granite called syenite, says the writer of "Cleopatra's Needle." In the quarries at Syene may yet be seen an unfinished obelisk, still adheriog to the native rock, with traces of workmen's tools so clearly seen on its surface that one might suppose they had been suddenly called away and intended soon to return and finish their work. This unfinished obelisk shows the mode io which the ancients separated these immense monoliths from the native rock. In a sharply-cut groove marking the boundary of the stone are holes, evidently designed for wooden wedges. After these had been firmly driven into the holes, the groove was filled with water. The wedges, gradually absorbing the water, swelled and cracked the granite throughout the length of the groove. The block, once detached from the rock, was pushed forward upon rollers made of the stems of palm trees from the quarries to the edge of the Nile, where it was surrounded by a large timber raft. It lay by the river side until the next inundation of the Nile, when the rising waters floated the raft and conveyed the obelisk down the stream to the city where it was to be put up. Thousands of willing hands pushed it on rollers up an inclined plane to the front of the temple where it was designed to stand. The pedestal had previously been placed in positioo and a firm causeway of sand covered with planks led to the top of it. Then, by means of rollers, levers and ropes made of the date palm, the obelisk was gradually hoisted into an upright posltion. It speaks much for the mechanical accuracy of the Egyptian masons tbat, so true was the level of the top of the base and the bottom of the long shaft, in no single instance has the obelisk been found to be out of the true perpendicular.

THE "JINGLET" IN THE BELL.—"The making of sleigh hells is quite an art," says a manufacturer of Maine. "The little iron ball is too big to be put in through the holes in the bell, and yet it is inside. How did it get there? The little iron ball is called 'the jinglet.' When you shake the sleigh bell it jingles. In making the bell the jinglet is put inside a little ball of mud, just the shape of the inside of the bell. Then a mould is made just the shape of the outside of the bell. This mud ball with the jinglet inside is placed in the mould of the outside, and the metal is poured in, which fills up the space between the ball and the mould. When the mould is taken off you see a sleigh bell, but it will not ring, as it is full of dirt. The hot metal that the bell is made of dries the dirt so it can be shaken out. After the dirt is all shaken out of the holes in the bell, the little iron jinglet will still be io the bell and will ring. It took a good many years to think out how to make a sleigh bell."—Ex.

MACHINERY IN SHOEMAKING. — The chief tools of the shoemaker then consisted of the hammer, his awl, his lapstone, his knives, and his harness for "setting up" his boots or shoes. The essentials of a shoe are the upper, the sole, the counter or heel stiffening, and the heel. These parts are again subdivided into the "vamp" for covering the front of the foot, the large and the small quarters for encircling the ankles, the button-piece, etc. The work of the shoemaker is to prepare and close these various parts of the upper and the linings together, to bring them into the desired shape, to fasten them to the sole which has been previously cut, to attach the heel, and then to give the various parts the desired finish and style. These processes indicate the lines along which machinery had to be applied. All the operations have been subdivided to the minutest detail, and in the performance of all of them, machines—more or less satisfactory in their workings—have been devised. The parts of the uppers are now sewed togetber by machinery, and they are pegged, sewed or screwed to the sole by machinery. Instead of the lapstone and the hammer for condensing the leather are now swiftly revolving rollers, and instead of the patterns for cuttiog out the soles are dies or sole-shaped knives set in machines. — George A. Rich, in the Popular Science Monthly.

THE ERICSSON SUBMARINE GUN.—The trials made with the submarine gun of the Destroyer at the New York navy yard have shown some interesting results. The gun was fired a number of times at different depths under water, and while there was some disappointment as far as accuracy of direction was shown, a record of ten shots shows that all of them would have hit a ship drawiog 22 feet below the water-line at a range of 100 feet. Nine of these would have been effective on the same vessel below the water-line at 200 feet; four at 300 feet; three at 400 feet, and two at 500 feet. The official report has not yet been published, but it may be said that the tendency of the projectiles to rise to the surface was somewhat less than had been expected, and the main difficulty found was in accuracy of direction. Some further trials are still in progress.—Railroad and Engineering Journal.

THE largest Americao flag ever made will float from the top of a very lofty "liberty pole" in front of the Administratlon building at the World's Fair. Upon request the State of Washington will furnish this big flagstaff as well as two or three others of the largest that are required by the Exposition.

AN American consul in Fraoce reports that the road system of that country (the best system in the world) "has been of greater value to the country as a means of raising the value of lands than have the railways. In France every market cart, with its broad tire, is a roadmaker."

IN order to clean a copper boiler, rub it with a fresh lemon from which the juice has been squeezed out, and then wash the boiler in clear water. This obviates the use of any acids about the kitchen, the presence of which is always dangerous, especially in the hands of inexperienced cooks.

PAINT can be made to stick to zinc by first usiog the following wash (recommended by Boetiger): Chloride of copper, 1 part; nitrate of copper, 1 part; sal ammoniac, 1 part; water, 64 parts. This wash coat is to left for 24 hours before applying to the paint.

STEEL knives which are not in general use may be kept from rusting if dipped in a strong solution of soda (one part soda to four of water), then wiped dry, rolled in flannel and put in a dry place.

Professional.

GAS WORK A SPECIALTY.

Testing and Working Silver Ores

A VALUABLE BOOK

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Krochnke's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, $2.00. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

SNYDER MINE, CAL.
In reply to your inquiry as to how the tramway is doing, am prepared to state that it has given ENTIRE SATISFACTION IN EVERY PARTICULAR. We can easily transport 65 tons of ore in 10 hours, with two men to load and one to tend brake, and with all the Wood Carriers on, we can transport 14 cords of wood in the same time.
When I look back upon the time when I was paying at the rate of $2.50 per ton for hauling ore, whereas it is now done at the rate of 13c. per ton, making **a saving of $130 per day**, and also, where it formerly cost me $5.50 per cord for wood delivered at mill, it now costs me but $3 per cord, making a saving of $1.50 per cord—I must say that I feel pretty well over my Tramway investment for it is a PERFECT SUCCESS.

Electricity.

Application to Mining Operations.

At a meeting of the Illinois Mining Institute, Elmer A. Sperry read a paper on "The Application of Electricity to Mining Operations," in which he said: The problem of replacing manual labor in coal-mining has engrossed the labors and thought of the ablest engineers of the age. Some of the earliest patents granted by the English monarchs were for mechanical mining devices with an avowed object of superseding manual labor. These machines were driven by animal or hydraulic power, and more recently by steam or compressed air.

They sawed, scraped, cut and plowed, but principally struck a blow. Many, even to a recent date, swung a pick provided with the ordinary transverse handle or power connection. Few, if any, of these machines have been successful under the severe duties required, and none have withstood the test of time. Machines generally employed in cutting or scraping devices are of limited application. They are worked with success where the seam is clear; but this, however, is the exception. The presence of iron pyrites or other foreign substances in the strata quickly dulls the knives and requires such heavy driving powers as to preclude commercial use. I have witnessed the operation of this type of machine in strata excellently adapted for machine-mining except for a frequent deposit of sulphur about the thickness of a silver dime.

These foreign substances are the bane of mechanical coal-cutting; they exist in the form of thin layers, thick layers, balls and boulders. The various forms are known to the miner as sulphur balls, lime balls, boulders, bone coal, etc. They are of extreme density, and their hardness is so great that even with the diamond drill they are considered the most difficult mineral substance encountered. With this foreign matter occurring in irregular forms and in masses of irregular distribution, it will at once be recognized that breakers are ahead of the designer, and that good engineers have been baffled in this field is not a matter of so much surprise.

The widely-varying systems of mining employed in the different districts still further render any single machine, which is equally well adapted to all, difficult of construction. Such a universal machine is, however, none the less desirable, and is doubtless approached most closely by the direct blow or reciprocating action, imitating in this feature, the time-honored pick, placing a force behind it never before obtainable. Such a machine may be perfectly guided and directed while in operation. It is the only machine that may be used for almost any condition or quality of coal, foreign substances, underlying strata or system of mining. It may be used for entry-driving, undercutting, digging or shearing.

Regarding electric haulage, Mr. Sperry said that it had been looked upon by the foremost operators as the coming system, and one which is destined to solve the problem of the economical transfer of the heavy product in mines. In studying the problems of electric haulage for mines one is met with the fact that the tracks are poor and light, the roadbed is crooked and irregular as to levels and generally of light construction. The curves, owing to the necessity of leaving pillars, and having connected sight entries, admit only of small radius curves, and excessive grades are often met with in the dip of the seam which cannot be obviated by cuts or fills as on surface roads, without great expense, especially if the entries are timbered, which is usually the case in western collieries. Yet a service of the highest efficiency and greatest capacity in speed and tractive power is required. The motor must work double shifts if necessary, and he at all times under perfect control of a motorman receiving $2.25 per day, and never fail for an instant.

The matter of stability of roadbed is a relative one. There are conditions under which a 10-pound rail would be as stable for a light locomotive as the New York Central's 100-pound rail is to the tremendnus load per driver in the high-speed locomotives recently placed in service on that road. Pounds' pull at the draw-bar is only obtainable by pounds' weights at the rail, yet for a heavy draw-bar pull it is not necessary to have the weight upon any one driver excessive.

The rule in determining the rail section required, is to multiply the tons' weight upon a single driver by 10, which gives the pounds per yard of rail section required. In the above instance 40 tons are upon four drivers, 10 upon each, which, being multiplied by 10, gives the 100-pound rail now being laid. In the case of my electric haulage of eight tons with eight drivers we have a ton per driver, multiplied by 10 equals a 10-pound rail, but a heavier rail is advised, not requiring as frequent cross-ties.

Mapping the Magnetic Field.

The common method of obtaining a cross-section of the field of force of a magnet by means of iron filings is very satisfactory when only temporary representations of the field are desired, but there has been wanting a suitable method of making a permanent map. It occurred to the writer that by employing a photographic dry plate a negative could be obtained from which any desired number of prints could be made, and it would have the additional advantage of representing the figures in their true colors. For obtaining the field of a bar magnet, the magnet was placed upon a large card previously marked with concentric circles and parallel lines to facilitate the centering of the magnet. A photographic dry plate was placed, film side up, directly upon the magnet. Iron filings were held at a distance of a foot above the plate in a bag of loosely-woven flannel, from which, by shaking the bag, they could be evenly distributed over the surface of the plate. The plate was then held at two points and tapped gently until the filings had arranged themselves along the lines of force. The room up to this point was, of course, only illuminated by nonactinic light, and the exposure was now made by turning the key of an electric lamp supported at a convenient distance directly above the center of the plate. The position of the lamp is a matter of considerable importance, as light from one side of the plates will cause the filings to cast a shadow and give an incorrect representation of the lines of force. Where an electric light cannot conveniently be used, nearly as good results may be obtained by holding a lighted match over the plate. After the exposure the plate is tapped so that the filings may slide off, and the few which still cling to the surface of the film are carefully removed by means of a fine camel's-hair brush. The negative is then developed and fixed in the usual way. The plates employed should be of a sort to give the strongest possible contrast, and a slow plate, such as Carbutt's process plate, was found to give most satisfactory results, it requiring an exposure of about 20 seconds. For making prints from these negatives any paper may be employed which will give good black and white tones. To obtain the best results the magnet should be a strong one and of considerable size, since the film is of necessity placed the thickness of the glass away from the magnet. It is also quite necessary to employ a considerable quantity of filings in order to make a brilliant negative. Very beautiful results are obtained by this process, which afford an excellent opportunity for a careful study of the magnetic field.

Since preparing the above, my attention has been called to the excellent article of Prof. Houston, in which a method exactly similar to the one here described was briefly outlined. This furnishes another instance of the simultaneous invention of a process by two inventors, each working wholly without knowledge of what the other is doing. C. B. Thwing in Electrical World.

ELECTRIC-HEATING—Without doubt the leading feature of the exhibition at the Dominion capital is the electric-heating display, the inventions of Thos. Ahearn, one of the proprietors of the electric street-railway of that city. The electric oven is inspected by thousands who through glass doors witness the process of baking in all its branches. The oven is about seven feet square and six feet high, substantially built, surmounted with small electric-lights, and within it are placed the electric-heating appliances which are fed from the ordinary electric-light service wires. The interior dimensions of the oven are four feet square, the ceiling being low and oval in form. An oblong window on one side permits visitors to watch the progress of the baking of bread, buns, etc. A dough-mixing machine driven by an electric motor is used in connection with the electric oven. The heating of houses by electricity is also demonstrated. A small electric furnace has been placed in a brick pit below the surface of the floor, and pipes leading from the furnace conduct the electrically-heated water through a radiator such as is used in house-heating. Mr. Ahearn has also arranged a novel form of electric-heating for the main building refreshment room, which will be conducted by the ladies of the W. C. T. U. The 12-gallon electric heaters connecting by pipes with five small heaters are used for making the tea and coffee supplied from this lunch room. —Electrical World.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.
Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.
By J. S. PHILLIPS, M. E.
The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Postmasters are requested to be sure and notify us when this paper is not taken from their office. If not stopped promptly (through oversight or other mishaps) do us the favor to write again.

SHEET IRON PIPE

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.

— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,

ALL SIZES.

For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade o annealed Charcoal Iron of great tensile strength.
The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, PITCH and PETROLEUM, at a Temperature of 300° Farenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

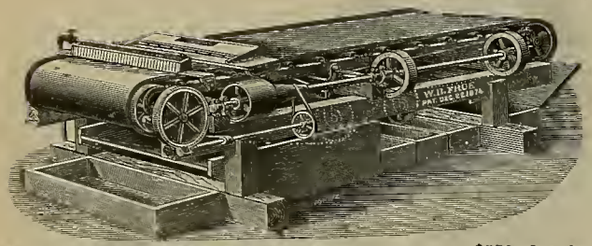
OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.



GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Cal veras Co., Cal., Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentratore and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller t bles. My repair account for the past six months has been too small tomention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.

H. J. SUMMERHAYES, Successor to Adams & Carter, Agent for the FRUE ORE CONCENTRATOR, No. 132 Market Street. - - San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

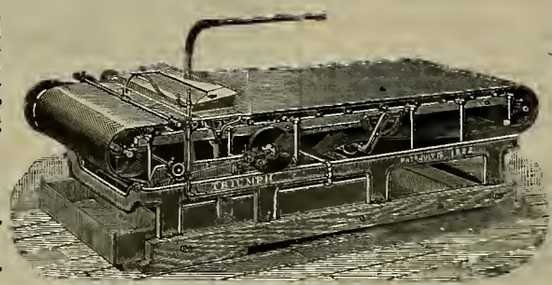
The competitive trials which have been held between the Triumph" Ore Concentratore, the "Frue" Vannere and other forms of oonoentrating devioes, do not warrant the assertion that the "Frue' Vanner is the best ore oonoentrator in the market. The fact that the "Frnee" have improved (corrugated) belts does not militate against the superiority of the "Trimphe;" for, when desired, they (the "Trimphe") can be mounted with a superior belt known as the "Blasdel" Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph' Ore Concentratore, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID MCKAY, JR.,

Signed] Sup't North Star and Original Empire Mining Co.

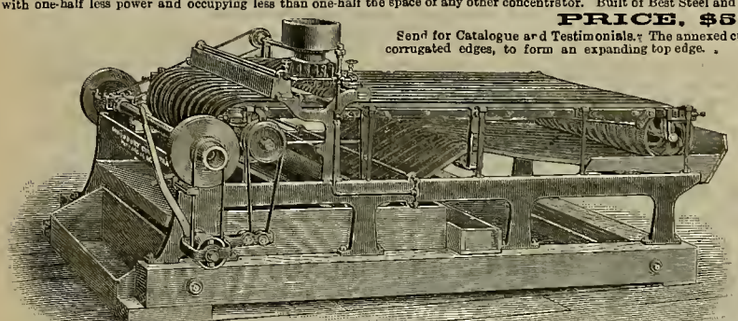
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

Was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THE CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of Best Steel and Wrought Iron. Strong and Durable.

PRICE, $575, f. o. b.

Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge.



THE SAN JACINTO ESTATE—Office of the General Mansger. CAJALCO, Oct. 30, 1891.

GEO. E. WOODBURY, ESQ.—Dear Sir: In reply to yours of the 27th inst., respecting the working and efficiency of the "Woodbury" Concentrator placed in our works by you, I am pleased to inform you that it is giving entire satisfaction; it has a much greater capacity than any other machine, and is doing fully one-third more work, with the concentrates equally clean, as from either of the machines at work here.

[Copy] Yours faithfully, S. HARRIS, Manager.

THE SAN JACINTO ESTATE, LIMITED—Office of General Representative, P. O. address, South Riverside, San Bernardino County.

CAJALCO, February 17th, 1892.

GEO. E. WOODBURY:—Your letter of inquiry about your concentrator came to hand in due course. Your machine is doing well, the motion is all right, and the machine is giving entire satisfaction. Yours faithfully S. HARRIS.

PATENTED Aug. 19, 1890.

GEO. E. WOODBURY, Man'f'r, 213 to 219 First St., San Francisco.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

—BUILT SOLELY BY THE —

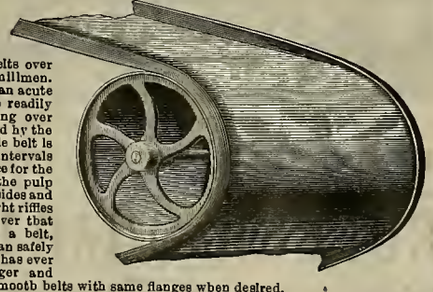
BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,

BUCYRUS, OHIO, U. S. A.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.



H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

DEWEY & CO. {220 MARKET ST., S. F. Elevator, 12 Front.} **PATENT AGENTS.**

AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description

ALL WORK TESTED AND GUARANTEED.

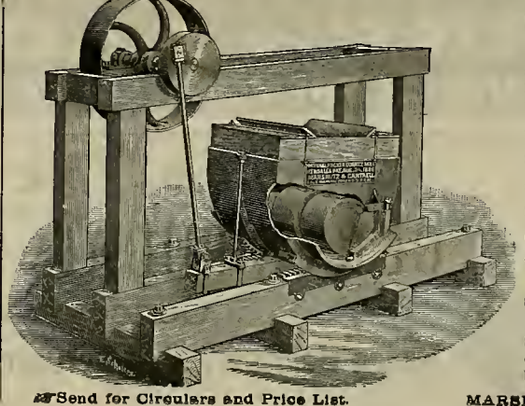
IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

☞Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

BAY STATE.—Amador *Dispatch*, Oct. 15: A vein of water has interfered with the work in the shaft at the Bay State, and operations there are suspended, for a time, until they can get in a pump to draw out the water.

AFTER QUARTZ.—Amador *Ledger*, Oct. 15: During the last month there have been more mining men from abroad prospecting around Jackson for quartz than for a long time before. There is no doubt that this influx of interested gold-seekers results from the report of the director of the mint upon the production of the precious metals in the United States for 1891, which places Amador second in the list of county-producers, and the Kennedy first in the list of mines in the State, with a production of gold and silver of $490,008.90. H. P. Holland, the inventor of the Holland concentrator, and George Serin, capitalist, both of San Francisco, have been for several days prospecting in the Amador Queen No. 2. They propose to take a carload of ore to San Francisco and test it by a new process, invented by Mr. Holland, and if it returns well, the people interested with them will procure the mine and work it to its fullest capacity. Rumor has it that the Clinton Consolidated is soon to be purchased by an English company. The Bay State mine is crushing 250 tons of rock at the Pacific mill, which from indications will pay about $8 in free gold.

SUTTER CREEK.—Our town is gradually nearing what many think a boom. Everything in connection with the mines is all life and activity. Developments at the Hector are going along nicely. The report in last week's issue in relation to the inadequacy of the power to run the entire machinery, I am pleased to state, was a mistake. Mr. Valentine states that they are already running 30 stamps, and can run the entire machinery without the least trouble and have power to spare. This is very gratifying news, as it was believed on the outside a week ago that the company would likely be hampered to some extent in this direction. In blasting at the 600-foot level, rock has been encountered of exceedingly good quality, and has every indication of permanency. Taking everything into consideration, the outlook for the Hector has never been so bright as at the present time. The South Eureka Company having decided at their meeting in Sutter Creek last week to sink 300 feet right away, preparations are being made as rapidly as possible, and I expect to report in my next three shifts in the shaft. The Wildman is looking fine, the 30 stamps being kept going steadily, and the ore being crushed is of a good average quality. The outlook for permanency is better than at any previous time. The Belmont is running along with the same crew of men. Mr. Tibbitts is hopeful of getting new hoisting machinery in the near future, which will be of great advantage to the mine.

Calaveras.

MINES RUNNING.—Calaveras *Chronicle*, Oct. 15: Mining has taken quite a boom during the last few months in our neighborhood, especially in the vicinity of Central hill and Chili gulch. There have been six new mining enterprises started during these few months. The Quaker mine, located in Chili gulch east of the Junction, is now in active operation under the management of Mr. Hugh McSorley. A shaft has been sunk on this mine a depth of 600 feet and a tunnel run west in order to crosscut the vein. This tunnel or crosscut is now nearly completed and a fine body of rock developed. It now has every indication of being one of the best paying properties ever opened up in this county, and that is saying a great deal for the Quaker. The Rigney mine is located in Chili gulch north of the Junction, and is under the management of Mr. Edward Rigney of Oakland, but formerly a resident of Mokelumne Hill. Mr. Rigney has done a great deal in the way of promoting the mining interests of Calaveras county. On this mine a shaft has been sunk 60 feet, and a crosscut made to determine the width of the channel. In running this crosscut Mr. Rigney came in contact with a large body of water, compelling him to cease operations until he could go below and purchase the necessary machinery to handle the water. The machinery is now at Valley Springs and in a day or two will be at the mine. It consists of a small engine and boiler and a large double-acting pump. The Williams mine, on the old blue lead at Mr. Williams' ranch, is now in operation under the able management of Mr. Vernon Wilson, a young gentleman from Oakland, who has been here for the past few months in the interest of Oakland capitalists in the way of selecting a mine. It is the general impression that he has made a very good selection. The old Coffee Mill mine, at the base of Golden Gate mountain, is now being operated by a company of San Francisco capitalists. A shaft has been sunk to a depth of over 200 feet, and a drift running east 25 feet tapped what is known as the old Bob Paul or Coffee Mill channel, and from present indications there will be a large force of men soon put at work in the mine. The company intend to erect the necessary buildings, and we are also informed that a 10 stamp mill will be put on the mine shortly. The What Cheer mine near Chili gulch, under the superintendency of Mr. F. J. Horswill, is running in full blast. There is no doubt but that under Mr. Horswill's management it will be made a good paying property. Mr. Horswill is also managing the Baker mine, situated near Central hill, in which he is sinking a shaft to a depth of 330 feet. He has already erected a large plant for hoisting purposes, propelled by gasoline, the first one of the kind ever introduced in this county. It is remarkable to note the difference in this section of the county. It reminds one of old times to see all the mines running in full blast.

Humboldt.

OIL STRIKE.—Alton *Home Journal*, Oct. 13: Many rumors concerning the East Branch oil well were afloat last week, and a big strike of oil was alleged to have been made. It is supposed that these rumors were started by some one who wanted to dispose of some oil stock. The principal stockholders of the Humboldt Oil Land Company, who are doing this work, are still confident of success. The drill still goes down, and prospects continue to be favorable. Superintendent Gilfillan has been hopeful from the start. The work has been hard and tedious, and many difficulties have had to be overcome, and though nothing wonderful has yet been accomplished, the parties in charge of the work are satisfied with the experiment and would not be so very badly disappointed if they had to bore two or three wells before oil was found in paying quantities. This has been a part of their calculations from the start. Superintendent Gilfillan is an expert in such matters, and is certain the oil is there, and though the reward of his labors may be deferred for the time being, pluck and perseverance is bound to win.

SILVEA.—Mr. B. L. Gillespie is still working at the ledge of silver ore on his place between Fruitland and Harris. He has followed up the ledge for some little distance, and the vein seems to grow wider and richer as the depth increases. Some samples of rock sent to an expert mineralogist in Denver, Colorado, assayed at the rate of $7 to $13 per ton. This is encouraging, and the development will be continued.

Inyo.

BIG PINE.—Cor. Inyo *Register*, Oct. 13: The political canvass has not operated to prevent transfers of Inyo property. C. A. Collins has about completed the negotiations for the transfer of the 16 claims at Pine mountain. This is the camp where Andy Fife and others have been running concentrators. The parties who examined this property, Messrs. Gifford and Book of Los Angeles, expressed themselves well pleased with the outlook. It is expected that the transfer will soon be made, and that the purchasers will put on a force of men to take out a quantity of concentrating ore during the winter, and that in the spring the new company will put on a 20 stamp mill. C. A. Collins has spent a month at Los Angeles, and has been able to place some ranch property of this section. He has purchased for C. M. Persons of Los Angeles the Tom Hughes ranch, and informs your correspondent that other important transfers are on the tapis. The little camp of Fish Springs is forging to the front. Broder, Gilliam and others are running out a lot of rock which they expect to net them $40 per ton. Big Pine parties are interested in some fine locations of graphite in the mountains west of Bishop. Specimens have been sent out for classification, and local experts pronounce the article to be the genuine quality.

MILL SOLD.—The big mill at Mammoth is reported sold to Jas. Cain of Bodie. The price is variously stated at from $1500 to $2000, which amount is but a small fraction of the cost of freighting it into where it is. The whole plant originally cost at least a hundred times its selling price. Stories vary as to what will be done with the plant, one version leaving it where it is, another saying that it is to go to Lundy.

Nevada.

BAUNSWICK MINE.—Grass Valley *Union*, Oct. 15: Superintendent Fitzgerald reports: Since last report the mine has improved materially both in quantity and quality of ore coming in. Average width of ledge in drift, one and a half, that assays from $10 to $50 per ton, and since work was resumed in the drift and shaft, has improved steadily. The ore in the bottom of shaft shows good assays and has increased since being sunk on. I have stopped sinking for the present to put in a tank for holding the water down to the 600 level, and will use the four-inch pump to sink the other lift; will also push both drifts 100 feet each. Face of both drifts at present time is in good milling ore and has been improving. Stope has been sunk the past week seven feet; total depth of shaft 625 feet. East drift extended four feet; total number of feet, 584. West drift, four feet; total, 68 feet.

CENTENNIAL GRAVEL.—*Transcript*, Oct. 14: Latest advices from the Centennial are to the effect that the drifts both east and west from the main tunnel are progressing in the back channel ground. It is about two feet above the track floor and shows well. All taken out in the exploration is saved up for washing when the sluices are constructed. The width of the gravel deposit at that point is expected to be fully as great as that developed in the front channel.

CHAMPION.—Grass Valley *Union*, Oct. 15: The new works on the Champion mine are approaching completion. They have been renewed and reconstructed throughout, and when ready for service will equal any in the county. Fifteen additional stamps have been put in, making 40 in all, which will give a largely increased reducing capacity. The condition of the mine is all that could be desired, as there is a large body of high-grade ore opened up, which insures the continuance of regular and large dividends. The Champion is an enterprising company, and under the management of Superintendent Fred Zeitler, has become one of the leading mines of the county.

MERRIMAC MINE.—Work at the Merrimac mine has been temporarily suspended, pending the introduction of electric power by the new company that has commenced the construction of works on the South Yuba river. The shaft of the Merrimac has now reached a depth at which larger pumps are required, and the putting in of these would necessitate heavier steam machinery or the introduction of waterpower. The electric power is preferred, and as there is a promise that it will be available by the opening of spring, the company deems it economical policy to wait for that event. The mine is looking well, the shaft carrying a strong vein of quartz which is of fair milling quality, and when the necessary power is secured there is no doubt that the mine can be worked to a profit.

GOOD PROSPECT.—James R. Nickeson returned from diamond creek yesterday, where he is having work done on several mining locations that he has in that region. He brought some of the quartz taken from the croppings that was literally sprinkled with free gold, and gave fine prospects. The ledges are large, being from eight to twelve feet on the croppings.

Mono.

THE BODIE CON.—*Miner*, Oct. 14: During the past week east crosscut No. 1, 550-foot level, was extended 10 feet. Winze below the main north drift, 550-foot level, was extended 5 feet. North drift from No. 3 upraise above the 300-foot level was extended 6 feet. Upraise above the 200-foot level was extended 8 feet.

THE MONO.—During the past week south drift, 550-foot level, was extended 28 feet. Started a west crosscut from above south drift and extended the same 11 feet.

Placer.

A BIG CLEAN-UP.—Auburn *Herald*, Oct. 15: The Morning Star mine is located about half way between Auburn and Ophir, close to the Eclipse mine, on the Doty's Flat road. Its owner is Otto T. Walter, of Ophir. Last spring he allowed Frank Miller and R. F. Miller to work the mine for a royalty. They took out a crushing of 10 tons which paid them at the mill $57 a ton. On the 1st of June they entered into a formal lease for six months, agreeing to work the mine and pay Mr. Walter 10 per cent of all they should realize. Last week they made their first crushing of 30 tons under the new lease. They cleaned up Saturday and found that they had, as the yield of their 30 tons of rock, over 20 pounds of retorted gold, or, to be exact, just 331 ounces, about $5000. They are only down 40 feet, at which point they started a drift and this last crushing was all taken out in removing 75 feet of the drift. The ledge varies from one to three feet in thickness and is all picking ground. If the strike was in some remote place, difficult of access, it would cause a panic; but as it is right here in the midst of civilization, in a country easy of access, it will cause no rush to this locality and no special flurry of excitement. It will serve to prove, however, that there are still some rich quartz mines remaining undeveloped in this part of California.

Shasta.

AT SOUTH FORK.—Shasta *Courier*, Oct 15: We understand that Pat Marley has disposed of his mining plant at South Fork, and that the trouble has been adjusted all right and things will probably soon be running in a satisfactory manner. The Gladstone mine did not shut down, as was reported last week, and the whole works are running full blast.

Sierra.

WILL CRUSH.—Grass Valley *Telegraph*, Oct. 15: To-morrow Andrew Husom will go to the Lone Star mine in Sierra county, and will take out several tons of the ore and have it crushed. There are various predictions as to what the ore will yield, and no one has rated it so low but that it will be profitable to work. The ledge is a very large one.

Tuolumne.

THE HAM & BIRNEY.—Tuolumna *Independent*, Oct 15: The Leechman Prospecting Company is extending operations by opening up the Ham & Birney mine. They are now putting in a Huntington mill and Woodbury concentrators. They will also put in two Dodd wheels.

NEVADA.

Washoe District.

CONS. CALIFORNIA AND VIRGINIA.—*Chronicle*, Oct. 15: There has been extracted from all parts of the mine during the week 987 1450-2000 tons of ore which was shipped to the Morgan mill, the average value of which, per car samples, was $26.20 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $22.70 per ton per battery samples. Bullion on hand in our assay office, assay value, about $16 500.

OPHIR.—1465 level—From the south drift, 101 feet below the sill floor of the 1465 level, from the Mexican into the Ophir ground, the west crosscut No. 2 has been advanced 16 feet; total length, 149 feet; in porphyry and clay carrying a little quartz of nominal value.

UNION CON.—900 level—The joint Union Con. and Sierra Nevada west drift has been extended during the week 27 feet; total length west from the joint shaft, 2509 feet. The face is in hard, black porphyry.

MEXICAN.—On the 1465 level the west crosscut, started from the drift run north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level, near the south line of the mine, has been advanced 21 feet; total length, 154 feet, continuing in a soft porphyry and clay formation.

UTAH.—The north drift from west crosscut No. 2 has been extended 18 feet; total length, 96 feet. This drift continues in porphyry and clay showing some quartz.

SIERRA NEVADA.—The Cedar Hill drift has a total length of 40 feet; face in porphyry with streaks of low-grade quartz. The intermediate tunnel between the Cedar Hill drift and Kenosha tunnel has been advanced 17 feet; total length 37 feet; face in porphyry.

ANNEX.—During the week have been engaged in timbering east crosscut No. 1 north; work resumed to-day in face of the crosscut.

GOULD & CURRY.—On the Sutro tunnel level, the joint north drift with Savage Co has been advanced a total distance of 585 feet; face in porphyry. Have finished cutting the drain from the main tunnel to the face of the drift.

BEST & BELCHER.—900—During the week the west crosscut No. 2 has been advanced 19 feet; total length 37 feet; face in porphyry, clay and stringers of quartz.

HALE & NORCROSS.—1800 level—During the week advanced No. 1 west crosscut 12 feet; total length, 62 feet; face in porphyry and quartz. West crosscut No. 2 on this level was advanced 13 feet; total length, 46 feet; face is in quartz and porphyry. Advanced west crosscut No. 3 15 feet; total length 33 feet; face in quartz and porphyry.

CHOLLAR.—We are making repairs on the various levels. The east crosscut, 160 feet south of north line, 930 level, is out 140 feet; face in soft porphyry.

POTOSI.—Extracted and sent to mill the past week 447 300-2000 tons of ore from the 550, 930, 1100, 1150 and 1300 levels. Worked during the week 400 tons. On hand at mill 77 1200-2000 tons. Average battery assay, $18.04. Average car-sample assays, $21.05.

WARD SHAFT.—The joint Alpha and Exchequer west crosscut, 1800 level, has been stopped and a crosscut started east on north line of Alpha, which is out 14 feet; face is in clay and porphyry. The joint Potosi and Bullion, northwest drift, 1800 level, is out 958 feet; face is in hard porphyry.

BULLION.—The north drift, from top of raise from east crosscut, 320 feet south of north line 1300 level, is out 78 feet; face in quartz and porphyry yielding low assays. The joint southeast drift from bottom of Potosi winze, 1850 level, is out 147 feet; face is in porphyry. The northwest drift from 1800 station, Ward shaft, is out 958 feet; face in hard porphyry.

ALPHA.—The joint northwest crosscut on north line of Alpha, 1800 level of Ward shaft, has been stopped and a crosscut started east from the same point, which is now out 14 feet; face in clay and porphyry.

EXCHEQUER.—The joint northwest crosscut on the north line of Exchequer, 1800 level of Ward shaft, has been stopped and a crosscut started east from the same point, which is now out 14 feet; face is in clay and porphyry.

OCCIDENTAL.—From the stopes on 350, 400 and 450 levels we have extracted 170 tons of ore and milled 80 tons of the value of $17.40 per ton as per battery samples. Have done no work on 750 level this week. The Zadig drift, Sutro tunnel level, has been extended 24 feet in hard porphyry.

NEW YORK.—The west crosscut, 110 feet north of shaft, 800 level, is out 37 feet; face in quartz and porphyry. During the past week we have hoisted 60 carloads of ore from the 650 and 750 levels that will average about $40 per ton.

SILVEA HILL.—We are stoping out on a streak of ore on the 260 and 490 levels. Have started a raise on this level from the Hillyer stope; top in low-grade quartz. Extracted and sent to mill the past week 191 445-2000 tons of ore from the 260 and 490 levels. Milled during the week 191 445 2000 tons of ore. Average battery assays, $19.96; average car-sample assays, $28.59.

Tuscarora District.

NAVAJO.—*Times-Review*, Oct. 15: The stopes above the 350-foot level continue as at last report. Sent to concentrator 105 cars of second-class ore.

BELLE ISLE.—The stope above the 350-foot level is looking very well, and the stopes above the 250-foot level ore improving. Sent to the concentrator 62 cars second-class ore.

NORTH BELLE ISLE.—No. 1 north drift, south 300-foot level, extended five feet; the vein is not so wide, but the ore is more compact. North intermediate above the south 400-foot level extended four feet; still yielding good ore. Sent to the concentrator 26 cars second-class ore.

ARIZONA.

MATTE SHIPMENT.—Prescott *Courier*, Oct. 15: Messrs. Stoddard and Taft came in from the Agua Fria Copper Company's properties yesterday. Mr. S. is the company's superintendent. He shipped a lot of matte and bullion yesterday. The bullion carried a very healthy percentage of gold. Both gentlemen bring encouraging reports from their mines and smelters, and say town lots are on the rise in the coming city of Stoddard.

WHITE HILLS.—Kingman *Miner*, Oct. 15: There are now over 100 men in the White Hills regularly employed in the mines, besides the many miners working on leases. The camp is looking better and more lively every day. Much work is being done on the Horn Silver mine at White Hills. The shaft is down 60 feet in the same grade ore as on the surface. The mine is one of the bonanzas of the camp, and with a mill in the camp would yield big money to the owners. The ore is free-milling, and the entire ledge will average over 100 ounces per ton. The G. A. R. mine, at White Hills, is daily proving itself a bonanza. At a depth of 100 feet the ore is much richer than on the surface, and the vein much wider. The two shafts were connected at a depth of 70 feet for the purpose of obtaining a good circulation of air, and now that this has been accomplished the main shaft will be sunk down as fast as possible. There are two other shafts on the ledge down about 80 feet that show the same high-grade ore as in shaft No. 1, being sunk by sheriff Lake, from which a great deal of ora is being taken. The mine can ship four or five carloads of ore per day, should the owners so desire. The many leasers on the Prince Albert mine, at White Hills, are making money. The leases extend to a depth of 50 feet, and so far as sunk on the ledges show up very rich ore. Conkey and Tyler have a fine showing near the apex of the hill on a small ledge and have considerable on the dump.

OLD WOMAN'S MOUNTAIN.—Kingman *Miner*, Oct. 15: Thomas Burke and John Jimmison

are in town from Old Woman's Mountain. They brought in a ton of ore from a claim owned by "Bannock" Kimberly and the latter gentlemsn, to be sampled. The ore is said to be exceedingly rich in free gold and silver, and the property from which the ore is taken is claimed hy competent judges to be ons of the best prospects in Scanlon district. They expect to return in a few days and open up the mine in good shape.

AUABEY DISTRICT.—From present indications, it would seem that considerable mining is being contemplated in Aubrey district this winter. W. D. McCright, of Signal, intends moving his little mill from the Burro mine, near some clsims owned hy him in the region near Groom's Peak, and a wagon road is now under course of construction from tbese mines to the big Sandy. Quite a nnmber of men are at work on the mines, and in nearly every instsnce are taking out ore of exceeding richness. The main sbaft on the Schaefer Treasnre is now down a depth of 80 feet, and shows rich ore the whole distance. At the bottom there is a four-foot ledge of high grade ore, while the vein matter is six or seven feet in width. Depth bnt adds to the richness and extent of the ore body in the mine. It will be thoroughly exploited this fall and winter.

FLORES MILL.—Twiggs & Co. havs finished their millrun at the Flores mill. Over 600 tons of ore was run throngh, from which a hig cleannp was made. Nearly 100 tons of concentrates were obtained running high in hase metal and containing $100 in gold and silver to the ton. This mill conld be kept running for years on the same cbsracter of ore by these gentlemen and made to pay handsomely.

WEAVER DISTRICT.—James Smitb came in from his camp north of Weaver district yesterday. He reports that work on the tunnel on tbe Horn Silver mine is being pushed, and that ore shows up in the face the entire width. Tons of rich mineral is being piled up on the dnmp and made ready for shipment to the sampler.

INDIAN SECRET.—Men are working all over the small, rolling hills of Indian Secret district, singly and in pairs. The many little ledges showing rich mineral are receiving the attention of the chloriders in camp. Many of the boys are making considerahle money and opening the ledges up in good shape. The Black Canyon range of mountains is receiving the attention of miners and prospectors. On tbe west side of the Detrital valley quite a camp bas been started and a new district will soon he fonnd. Many valuable locations of gold and silver have been made and prosperity reigns supreme.

MONTANA.

ANACONNA.—Butte *Inter-Mountain*, Oct. 12: The shaft of the Anaconda mine reached the 1100-foot mark this morning, and it is nnderstood sinking will he continued to the 1500-foot level. The work of cutting a station at the 1100-foot level will be commenced next week. The sha't is a three-compartment, 22x10 feet, outside measnrement. An important change recently made at the mine is in the matter of pumping the water from the mine. A tunnel has heen run from the 300-foot level to a point near the Parrot tramway. The discharge pipe of the pumps will he conducted along this tunnel, discharging the water into a ditch which will convey it to the creek near the Parrot amelter. By this method the loss occasioned by pumping the water tbe additional 300 feet to the surface will be entirely obviated. The Never Sweat mine, one of the Anaconda properties, is in active operation. At present a station is being cut at the 500-foot level and it is understood that the shaft will he developed at once at least another 100 feet. For this purpose, additional machinery capahls of thoronghly developing the property will be placed in position. It is understood that the engine ordered is the same size as the one at the Anaconda mine.

NEW PLACER DIOGINOS.—Some rich placer gronnd has heen discovered during the past few weeks away up on Lost creek. The locality is one that heretofore has been practically unexplored, a trail through the tbick timber having only recently heen made. Tbe locality is ahout three and one-balf miles beyond the Silent Treasure mine. Onslow Peters and others have located about 4200 feet of claims and taken up 600 inches of water right. They are elated over the new diggings, which show an ahnndance of black sand that sparkles with color and carries precious stones- Some of this black sand, washed from a pan of dirt, was brought to Butte during the week and assayed. It carried $380 in gold to the ton. Mr. Peters says there is a great abundance of this sand and he thinks he has struck a veritable bonanza in placer diggings. Water is ahundant and can easily he conveyed to the claims. He says there is still plenty of ground left beyond his locations.

THE ST. LAWRENCE.—At the St. Lawrence mine work was resumed last Monday and at present tbe force of miners employed is greater than at any previous period. The miners state that the levels are entirely free from foul air. This result was accomplished by conducting a ten-inch galvanized iron pipe down the pump shaft from the surface to the 600-foot level. A steam pipe was also run to the 100-foot level, and a jet of steam was allowed to enter the air pipe. The jet of steam causes a suctiod in the air pipe, which draws all tbe gases from the lower levels.

A NEW SMELTER.—Heinze & Giffard, wbo have a lease on the Stella and Oneida, are superintending the erection of a small smelter near the Liquidator mill. The smelter is being erected by eastern capitalists and will contain, when completed, two blast furnaces and one reverbatory. It will be in operation about the middle of Decemher, and besides the treatment of Oneida and Stella ores, custom ores will be treated.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WAAK ENDINO OCT. 11, 1892.

484,172.—BEE-SMOKAR—G. W. Brodbeck, Los Angeles, Cal.

484,292.—MUSIC-LEAF HOLDAA—A. O. Brown, S. F.

483,993.—RAIL JOINT—W. Curtis, Oakland, Cal.

484,144.—TUAULAA METALLIC POLA—D. Dorward, S. F.

484,149.—SASH FASTANAR—C. S. Fay, S. F.

484 190.—HOSA-BANN—Geo. Ferguson, Los Angeles, Cal.

484,313.—SHOE FASTANER—Hamill & Johnson, Glohe, A. T.

484,199—ELECTAIC-ARC LAMP—J. A. Hayes, Carson, Nev.

484,154—FRUIT-PITTAR—G. C. Howell, Alameda, Csl.

484,216.—HORSE-TAMING APPARATUS—Rslph Mszza, Niles, Cal.

484,223.—AUXILIARY VALVA FOR ELAVATORS—A. J. McAdam, S. F.

484 221.—ROSETTA-TURNING CUTTER HEAD—R. B. Moore, S. F.

484,335.—SUSPENSION HOOK—G. A. Moss, S. F.

484,231—RATCHET DAILL BRACE—W. P. Nolan, S. F.

484,235.—SASH FASTENAR—J. C. Plunkett, Oakland, Cal.

484,237.—KILN—Wm. Rsdford. San Joss, Csl.

484,239—CULTIVATOA—C. C. Reynolds, Kelseyville, Csl.

484,163—SAWTOOTH SWAOE—W. W. Ryder, Alsea, Or,

484,249.—WOODEN LIQUID CONTAINING VESSEL—J. M. Schofield, Merced, Csl.

484,053—HAMA CLIP—James Scott, Betbany, Cal.

484,378.—FIFTH WHEEL—S. H. Sexton, Tucson, A. T.

484,260.—FIAA ESCAPA—P. B. Sullivan, Tuscarora. Nev.

484,379.—SHAEP-SHEAAS—J. D. Todd, Chico, Cal.

484,349.—BOOKBINDINO—Dan'l Waide. S. F.

484,169.—FORCE PUMP—M. L. G. Wheeler, North Yakima, Wash.

484,074.—LAWN SPAINKLER—D. C. Wilgus, Los Angeles, Cal.

21,887.—DASION FOR ENOINA FRAME—Dan'l Best, San Leandro, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELECTRO-THERAPEUTICAL INSTRUMENT.—Jas. W. Moliere, S. F. No. 482,745. Dated Oct. 4, 1892. The object of this invention is to provide an apparatus for the production of ozone and a means whereby it may be directly inhaled by the person desiring to nse it, and in conjunction therewith of a means for applying a current of electricity. Ozone is readily developed hy the action of static electricity and may be developed by machines constructed for the pnrpose. The ozone is, however, to a great extent wasted in the ordinary arrangement of snch machines, and this apparatns is designed to overcome this difficulty.

APPARATUS FOR MAKINO MALT.—Wm. A. Peters, S. F. No. 483,748. Dated Oct. 4, 1892. This apparatus consists of a casing in whicb is a series of revolving open work or foraminous cylinders. Connected with the casing is a vessel which is itself connected witb a steam-pipe and with an airblower or fan. Under the casing is a drying-kiln having within it a series of open-work cylinders, caused to revolve by suitahle means. The operation carried on in this apparatus is briefly as follows: The barley is steeped in the tanks in the usual manner. It is then supplied to the cylinders in the casing, and hy their rotation it is thoroughly and regularly stirred. The cold air forced into the vessel to which steam is supplied condenses the steam and the mo'sture-laden air is allowed to enter the casing, wherein it keeps the barley properly moist. When sufficient growth has been obtained the malt is discbarged into the cylinders in the kiln, wherein it is constantly agitated and subjected to the drying action of the heated air in the kiln.

MACHINE FOA GAOOVING SHOE-SOLES.—George Bryant, S. F. No. 483,319. Dated Sept. 27, 1892. The object of this machine is to form grooves or cbannels upon the surface or surfaces of soleleather and transversely with the soles at that part where they cross the ball of the foot.

HARNESS-SADDLE PAD.—Russell Whitman, Oakland. No. 483,754. Dated Oct. 4, 1892. In the construction of harness-saddles it is customary to make them with pads permanently and rigidly fixed under the saddle upon each side of the center, these pads being adapted to rest on the back of the horse, on each side of the backbone or withers, so as to protect the latter from injury by the saddle. The back-straps are also attached to the saddle or extenaions therefrom. In this improvement I employ independent, flexibly-connected, snpplemental pads, which are removably attached beneath the main harness-saddle with means for allowing a rocking motion, wbich makes the pads self-adjustable and they will fit themselves to the sbape of the horse's back. The back-strap also passes through the saddle with a freedom which allows side movement to adapt it to irregnlar strains upon the shafts, which wonld otherwise tend to pull the saddle from sids to side and chafe the animal's back.

LATCH AND LOCK COMBINEN.—John E. Armstrong, Santa Cruz. No. 483,318. Dated Sept. 27, 1892. This invention consists of a peculiarly constructed door lock, having a reciprocating latch bolt, and a knob spindls which is adapted to be both turned axially and movable longitudinally, so that whsn in ons position it will freely operate the latch and when in another position it will not do so. In conjunction with this is a spring-controlled catch which engsges and locks the catch when desired so that the latter cannot he moved, and a peculiarly formed key and key-way are employed with other devices to increase the safety of the lock.

HORSE-TAMING APPARATUS—Ralph Mszza, Niles, Alameda Co. No. 484,216. Dated Oct. 11, 1892. This is an apparatus to be used for making horses, mules, oxen and otber animals tams and gentle. It consists of a padded box or stall of sufficient size to contain the horse or other snimal, and mounted upon a vertical axis so that it can be rotated. The idea is, before the horse is harnessed or bridled, tbat he may be reduced to snch a condition that this may be done before the animal is able to protest by any of the nsual means adopted by animals. When the horse becomes vicious or intractable he is led or driven into the box, which is then rotated upon its vertical axis with as mnch speed and for as many revolntions as may be found necessary. This varies with different animals. Soms are made so dizzy as to fall down after a few revolutions, while others cannot hs overcome until ths apparatus hss been rotated a number of times snd at considerable speed. The inventor says that by this operation ths animal will bs rendered so docile that it can bs harnessed, attached to ths cart, and driven with little difficulty. The apparatus enables the operator to tams an animsl and render him gentle without any violent or cruel treatment.

ROSETTE-TURNING CUTTER-HEAD—Robert B. Moore, S. F. No. 484,221. Dated Oct. 11, 1892. Tbis invention relates to a head to hold cutters for turning rosettes in wood such as are employed for ornamental finishing for door and window casings and for other purposes. Heretofore, it has heen customary to form the cutterhead witb two oppositely-disposed radial plates upon whicb the cutting-knives of any desired shape are secured. With this construction, especially where aoft wood is heing employed, a large percentage of the pieces are spoiled hy the tearing of the wood where a head is formed. Tbis objection is overcome by the new device, and peculiar knives are so set with relation to each other as to maintain tbe same-sized cut and shape at all times.

FIRA-ESCAPA.—Philip B. Sullivan, Tuscarora, Nev. No. 484,260. Dated Oct. 11, 1892. The invention consists in oppositely reciprocating cages fitted and moving in suitable guides in or on the huilding, a winding-drum situated on the ground below, a brake-mechanism for controlling the movement of said drum, a cable wound in opposite directions ahout the drum and having its ends secured, one each to a cage. The object of the invention is to provide a fire-escape, the operation of whicb is due wholly to the weight of the loaded cage, wbich not only carries down its own passengers, but at the same time elevates the empty or partially empty cage to position to receive other passengers, whose weight in turn will elevate the first cage after the latter has been relieved of its passengers. The whole device is nnder control of the operator on the sidewalk who manipulates the brakes.

BOOK OR MUSIC LEAF HOLDER.—Alexander O. Brown, S. F. No. 484 292. Dated Oct. 11, 1892. This invention consists of a clamp-plate adapted to be readily attacbed to the edge of the leaf and a finger-catch ring carried by the plate. The invention further consists in the peculiarity of the attachment of said ring to the clamp-plate whereby tbe ring will remain in a position in wbich it can be most readily engaged by the finger to turn over the leaf.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

SAN LUIS OAISPO CHAOME COMPANY, San Luis Obispo. Capital stock, $25,000. Directors—Robert E. Jack, W. L. Beebee, H. G. Sbaw, M. Goldstein and W. I. Bevan.

THA WHEELER MANUFACTURINO CO. Capital stock, $100,000. Directors—R. N. Simpson, E. H. Gould, R. Wheeler, Chester Deering and C. H. E. Hardin.

LUCKY HORN MININO CO. Capital stock, $100,000. Directors—J. J. Haley, A. S. Moore, G. W. Horn, W. H. Worden and William Jeffray.

CENTRAL AMERICAN STEAMSHIP CO. of San Francisco. Capital stock, $1,000,000. Directors—H. P. Squire, F. M. Crawford, M. I. Crawford, F. S. Stratton and F. W. Leavitt.

POAT OF TRIUNFO WHARF ANN LIOHTERAOE CO. Capital stock, $100,000. Directors—H. P. Squire, F. M. Crawford, M. L. Crawford, F. S. Stratton and F. W. Leavitt.

SAN FRANCISCO SMALTINO AND REFINING CO. Capital stock, $300,000. Directors—Albert H. Stone, Richard Stege, George W. Dornin, M. H. Gilson, Edward F. Stone.

BISHOP CONS. M. AND M. CO. Capital stock, $40 000. Directors—L. Farr, Walter G. Manuel, J. A. Chestnut, Jr., E. W. Moody and Ernest D. Williams.

Mining Share Market.

SAN FRANCISCO, Oct. 19, 1892.

Mining shares the past week under review were only fairly active, witb the public generally selling under a well-executed break in the middle and north end shares. Shares in the first group declined, under the lead of Hale & Norcross, and in the last group under the lead of Con. Virginia. It is unnecessary to say that the decline was planned and the manipulation done by the mill rings to get in shares all along the line—which they succeeded in doing—by demoralizing the public during the break through false reports of the work under way in the mines having proved a failure and that Con. Virginia would levy an assessment. It is needless to say that members of the mill rings, their camp followers and their leading broker, Bob Morrow, only regret that no development of ore can be made. "If we can only find a bndy of ore," is the refrsin which is now parroted by the reported organs of the mill rings. What has become of the reported rich nre in Belcher, Con. Virginia and two other mines, which was used to aid in promoting the small deal last month? The ore development, it is safe to say, answered the purpose, and was lost to sight when the market broke and it was necessary to squeeze the last share possible from disgusted and demoralized outsiders. What the next upmove will be made on it is hard to say, yet the rings can be trusted to get up a plausible story; but it is doubtful if they will be successful in getting only those in the market who buy only to sell when a profit is in sight. As long as this class, and not monied outsiders, deals in shares, the upmoves will be treacherous and should be taken advantage of to sell by all who have been lured into the net. It is time enough to deal in shares when *all* the bullion is turned over to the companies and the mines worked and the ore milled to conform to the law under which the companies were incorporated. Under the present system of working the mines, and milling ore, the only thing that outsiders get is assessments, while the rings get the bullion. It is a great game this of working the Comstock mines, the tricks in which it is doubtful if even a highwayman would stoop so low as to play.

At the annual meeting of the Con. Virginia Mining Co., the Mining Stock Association filed a protest against the manner in which the mine has been worked, and demanded that certain specific reforms be instituted. Is it not about time that the Association takes stronger and more aggressive measures to bring about the long-desired reform in the management of the Comstock mines, so that all the bullion extracted from the ore, slimes or tailings be turned over to the companies and not, as is contended, misappropriated? The late J. C. Flood, if we are correctly informed, was made to refund to a mining company on the Comstock about $800,000 or take the consequences. Of course he preferred doing the former. Why is not the same course pursued now? Is it not about time to cry "Halt!" and force the mill-rings and their dummy directors to pursue such a course that there will not be occasion for even suspicion of collusion by which shareholders are defrauded of their proportion of bullion produced by the mines? If we mistake not, the members of the Mining Stock Association stand where the writer does, viz., turn all bullion over to the mining companies, and then the fight against members of the rings will be stopped. It is a simple proposition, and if honest management is to be the watchword, such a course should be pursued. If this is not done, then criminal proceedings should be instituted against the directors of the mines that it is contended are being looted.

Reports are current that the price of leading shares must go off about 20 per cent before it is safe to buy for the coming deal. Whether these reports are correct we do not know, but it is quite a safe proposition for those who operate in shares to sell if there is an upmove between now and election, but to hold if prices are not advanced. If there is not a deal now there will unquestionably be one after the election, but if there is one now then it is hardly reasonable to look for another this year. While believing in another upmove, yet we again warn patrons against the game as long as it is bullion for insiders and assessments for outsiders.

Prudent and reliable advices from the Comstock mines are of a far more encouraging character than at any time this year, but appear to be suppressed by the mill rings, probably for more successful mine-looting. In Belcher, while the developments do not warrant high figures for the shares, they justify higher prices than now rule, *provided* the ore is to be honestly milled. In Hale & Norcross the work is very important, but it is made to look like a failure. In running west, work is invariably stopped when the lode is reached. Why is this done? It looks as if the lesson in the Hale and Norcross suit were not enough. If this is so, why are not criminal proceedings instituted or the mine placed in the hands of a receiver. In Con. Virginia, it is said, they will soon begin stoping rich ore to the west. In Ophir and Mexican, important work is under way as is that in Sierra Nevada, but whether outsiders who do not sell their shares if prices go up, will get more than assessments is rather doubtful. The increased flow of water in the Carson river has admitted of the mills starting up.

This (Wednesday) afternoon the hear raid which was announced yesterday was continued with the entire line sold down. The prices at which shares sold nearly covered the 20 per cent decline which had been expected. It is now asserted that the margins will be cleaned up by to-morrow, and that some time in next week the rings will be ready to start the deal. Advices from the Comstocks report that in Belcher they expect to strike during the recess the ore which they have been running for on the 400 level. Probably it was the certainty of finding this ore which caused such strong hear talk by brokers, cappers and writers, and also hear writing in two of the daily papers. It is a great game this of working the Comstock mines.

Market Reports.

Market Review.

SAN FRANCISCO, Oct. 19, 1892.

General trade was only fairly active the past week. There is still considerable winding up of accounts, but, as a rule, the list is far short of previous years. The conservatism in trade continues to prevail in all branches, and it is to this that must be largely attributed the seeming inactivity in the markets. Buyers for large houses in the interior say that their purchases aggregate considerably more than they did at the corresponding dates in either 1891 or 1890, but while saying this they state that the purchases do not indicate more than assortment stocking. This statement is emphasized by an almost entire absence of speculation in certain lines, the statistical situation of which warrants, on its face, much better prices than now obtain, but it is being conceded that business, backed by increasing confidence, is working into a better position when speculative movements will largely prevail. When the latter does come to the front, much more prosperous times will be assured. If the old saying that "iron is the barometer of trade" still holds good, then the turning point has been reached, for the market for pig iron is gradually strengthening at the East under an enlarging and steadily growing consumption. The increasing demand for pig iron appears to come mainly from plants which are owned by or have close connection with rolling mills and steel plants. This indicates that the railways are to be heavy buyers of rails and rolling stock. For fully two or three years they appeared to have confined their purchases, but necessity evidently forces them to make extensive repairs and improvements.

The local money market continues in an anomalous condition. While banks report the reserves larger than usually carried, yet the most of them claim that the market is working close. Be this as it may, yet we are informed by leading business men that they have no difficulty in securing accommodations at previous rates of interest. Call or short-timed paper finds ready acceptance, but term paper is closely scrutinized and not desirable, particularly when the time for annual and semiannual dividends and disbursements is so near at hand. There is another factor, viz., the uncertainty regarding what action will be taken by the International Monetary Conference on the silver problem, and until the conference meets and definite action taken, there will prevail more or less uneasiness. It is contended by the better-informed financiers that if the conference will act favorable to bimetallism, then a new era of prosperity in an enlargement of speculative and industrial pursuits is assured; but if the conference should be unfriendly to bimetallism, then the future would be clouded in uncertainty and an era of general disturbances and financial and commercial disasters be ushered in. This opinion is grounded on what the PRESS has contended, that further action by European powers against silver would bankrupt the many consumption countries, whose monetary currency is silver and thereby precipitate a crisis which would bring ruin to those countries which are large suppliers of commodities required. Writing as to the situation, Cordley & Co. of New York says:

An early date has been set for the convening of the International Monetary Conference, and there are many indications that the British Government, while itself strongly opposed to taking any action looking to universal bimetallism, is being forced by the mercantile and manufacturing interests of Great Britain to give the matter something more than the cursory attention it had first intended. It is therefore reasonable to hope for international bimetallism. The only fear is that the intense opposition to it in the inner circles of the present English Government will postpone the matter until after it is forced by an acute crisis. While many have looked for such a crisis in this country, a very careful canvass of the situation leads us to think that England will suffer first and most.

SILVER—The market advanced the past week both at home and abroad, but yesterday prices shaded off. The advance and decline show that the metal is still under speculative influences and that the price is controlled largely by the reported syndicate interest in securities and commodities whose market value is governed by that of silver. There was exported by sea the past week $49,640 in bullion to China and $69,000 to Japan.

MEXICAN DOLLARS—The exports by sea the past week aggregate as follows: To China, $911,697, and to Bombay $13,500. This is the largest aggregate shipment made at any one time within the past two years. The advancing tendency of silver no doubt caused the increased demand. The market is steady at around 67½ cents.

QUICKSILVER—Receipts the past week aggregate 460 flasks, and exports by sea 50 flasks to Mexico. The home demand has been fair. The market is barely steady.

COPPER—The market has held to fairly firm prices. The strength of the market has given rise to reports of another combine. While advices received indicate that amicable arrangements have been made with Haggin, yet they do not warrant the assertion that a combine has been formed. The advance was largely due to larger consumptive buying and lessened stocks. London cables under date of Oct. 13 report as follows: "In the copper market there is a more cheerful feeling and prices have advanced quite sharply. Reduced supplies impart some confidence, but the market has gained more support from heavy buying by leading firms, together with freer buying by leading operators. There has been a good inquiry from India, and home consumption is better. Furnace material is at present sparingly offered."

COAL—Imports the past week aggregate as follows: Coos Bay 450 tons, Nanaimo 8523; Tacoma 4700; Seattle 7279; Departure Bay 7200; Swansea 3290; Liverpool 3445; Cardiff 3168. Total 38,055 tons. The market while reported strong for Australian does not show any change in quotations. The imports the past week were quite large, particularly of coast. The demand continues disappointingly light. Australian freights are reported higher.

PIG IRON—The market while not quoted higher appears to have a hardening tendency. New York *Iron Age* says: While there has been an increase in the capacity of the blast furnaces working from 151,648 tons weekly on September 1 to 158,027 tons per week on the 1st of this month, this has been more than offset by a decrease in the stocks during the month of not less than 82,000 tons. The increase in the output has chiefly taken place among those plants which are owned by or have close relations with rolling mills and steel plants. Foundry and forge irons, and particularly the former, are unquestionably firmer in all markets, but is evident that in the West at least the attitude of sellers is to be tested by a period of dullness.

BORAX—Receipts the past week aggregate 220 cks., and exports by sea 1050 cks. to New York. The market is steady at current quotations.

LIME—Receipts the past week aggregate 2806 bbls. The demand is only fair, with quotations given at $1.25@1.50 per bbl.

ANTIMONY—The market is weak at quotations. New York mail advices quote that market as follows: 10½@10¾c for Hallet's; 11c for LX; 11¼c for Crown and 11½@11¾c for Cookson's in round lots.

PIG LEAD—The market is slow. Eastern mail advices report that the production appears to be steadily gaining on the consumption, and consequently buyers are only induced to operate freely by concessions.

PIG TIN—The market is only moderately supplied, but this is neutralized by an offish demand. At the East there appears to be another bull campaign under way. The manipulators appear to be moving cautiously as yet. Consumers do not take beyond near-by wants.

State Game and Fish Laws.

In Effect May 17th, 1891, and Until Further Notice.

The Acts relative to game and fish, as amended by the last Legislature, are as follows:

Every person who, in the State of California, between the first day of March and the first day of October of each year, hunts, pursues, takes, kills, or destroys any quail, partridge, or grouse, or any kind of wild duck or rail, is guilty of a misdemeanor.

Every person who, in any of the counties of the State of California, at any time, takes, gathers or destroys the eggs of any quail, partridge, or grouse, or mallard duck, or any kind of summer duck, red head, teal, or any gray duck, or any other kind of wild duck, is guilty of a misdemeanor.

Every person who, in the State of California, between the first day of January and the first day of July in each year, hunts, pursues, takes, kills, or destroys doves, is guilty of a misdemeanor.

Every person who, in any of the counties of the State of California, hunts, pursues, takes, kills, or destroys any male deer, antelope, mountain sheep, or buck, for the period of two years from the date of the passage of this Act, is guilty of a misdemeanor.

Every person in the State of California who has in his possession any green hides or any green skins of any deer, elk, antelope, or mountain sheep, killed after the passage of this Act, and before the expiration of two years from the passage of this Act, is guilty of a misdemeanor.

Every person in the State of California who, at any time, hunts, pursues, kills, takes, or destroys any female deer, antelope, elk, mountain sheep, or doe, shall be guilty of a misdemeanor.

Every person who shall at any time hunt, pursue, take, kill, or destroy any spotted fawn, is guilty of a misdemeanor.

Every person who shall take, kill, or destroy any of the animals or birds mentioned in this section, at any time, unless the carcass of such animal or bird is used or preserved by the person taking or slaying it, or is sold for food, is guilty of a misdemeanor.

Every person who shall buy, sell, offer, or expose for sale, transport, or carry, or have in his possession, any deer or deer-skin, or any hide or pelt from which the evidence of sex has been removed, or any of the aforesaid game, at a time when it is unlawful to kill the same, as provided by this and subsequent sections, is guilty of a misdemeanor.

Every person who takes, catches or kills, or exposes for sale, or has in his possession, any speckled trout, brook or salmon trout, or any variety of trout, between the first day of November and the first day of April in the following year, except salmon trout taken with rod and line in tide water, is guilty of a misdemeanor.

Fishing for salmon, shad, etc., between six o'clock Saturday evening and sundown of succeeding Sunday prohibited.

Fishing by explosives, or by pound, weir, cage, trap or set net, prohibited.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

STOCKHOLDERS' MEETING.

Offine of the Superior Mill & Mining Co.

Notice is hereby given that a meeting of the stockholders of the Superior Mill and Mining Company will be held at the Office of the Company, No. 303 California street, Room 11, on Saturday the 29th day of October, 1892, at the hour of one o'clock P. M., for the purpose of electing a Board of Directors until the next annual meeting, and for the transaction of such other business as may come before the meeting.

The Annual Election, not having taken place at the time appointed, and no call therefor having been made or published, and the Corporation having no Secretary, this meeting is called and notice thereof given to the Stockholders by the President of the said Corporation.

D. L. MUNSON, President.

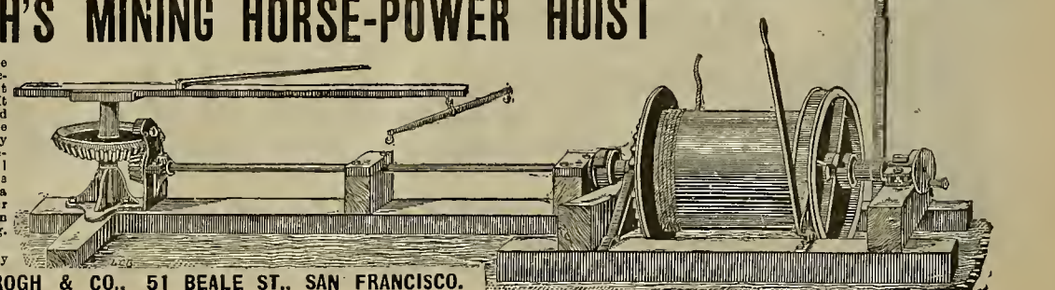
Office, Room 11, No. 303 California St., S. F., Cal.

Engraving. Superior Wood and Metal Engraving, Electrotyping and Stereotyping promptly attended to at this office.

KROGH'S MINING HORSE-POWER HOIST

Is known to be the best Horse-Power Hoist now made. It is strong and durable. The drum will carry 1000 feet of five-eighths steel rope. It can be used to run a pump or blower in conjunction with hoisting.

Manufactured by



F. W. KROGH & CO., 51 BEALE ST., SAN FRANCISCO.

CRANE COMPANY,

MANUFACTURERS OF
WROUGHT IRON PIPE
MALLEABLE and
CAST IRON FITTINGS,

BRASS & IRON VALVES,

NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES

For SAVING GOLD!

IN QUARTZ GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER

AT REDUCED PRICES.

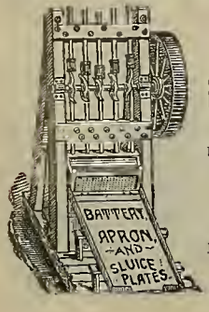
Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates Replated, Bought, or Gold Separated. THOUSANDS OF ORDERS FILLED.

SAN FRANCISCO NOVELTY, GOLD, SILVER AND NICKEL PLATING WORKS,
68, 70 & 72 First St., San Francisco, Cal.

SEND FOR CIRCULARS.

JUSTINIAN CAIRE, Agent,
521 & 523 Market St., San Francisco,
—DEALER IN—
Assayers' and Mining Material.
—MANUFACTURER OF—
BATTERY SCREENS AND WIRE CLOTH.

Agent for HOSKINS'
HYDRO-CARBON ASSAY FURNACES.



IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD

In Quartz, Gravel and Placer Mining.

PRICES GREATLY REDUCED. ONLY REFINED SILVER AND BEST COPPER USED. OVER 3000 ORDERS FILLED. FIFTEEN MEDALS AWARDED. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated. These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Streets, San Francisco.

SAN FRANCISCO GOLD, SILVER AND NICKEL PLATING WORKS,

E. G. DENNISTON, Proprietor. 653 & 655 MISSION ST., SAN FRANCISCO, CAL.

Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper.
SEND FOR CIRCULAR.

RECEIVED EVERY MEDAL Awarded on the Pacific Coast for Silver-Plated Amalgam Plates and Best Gold, Silver and Nickel Plating.

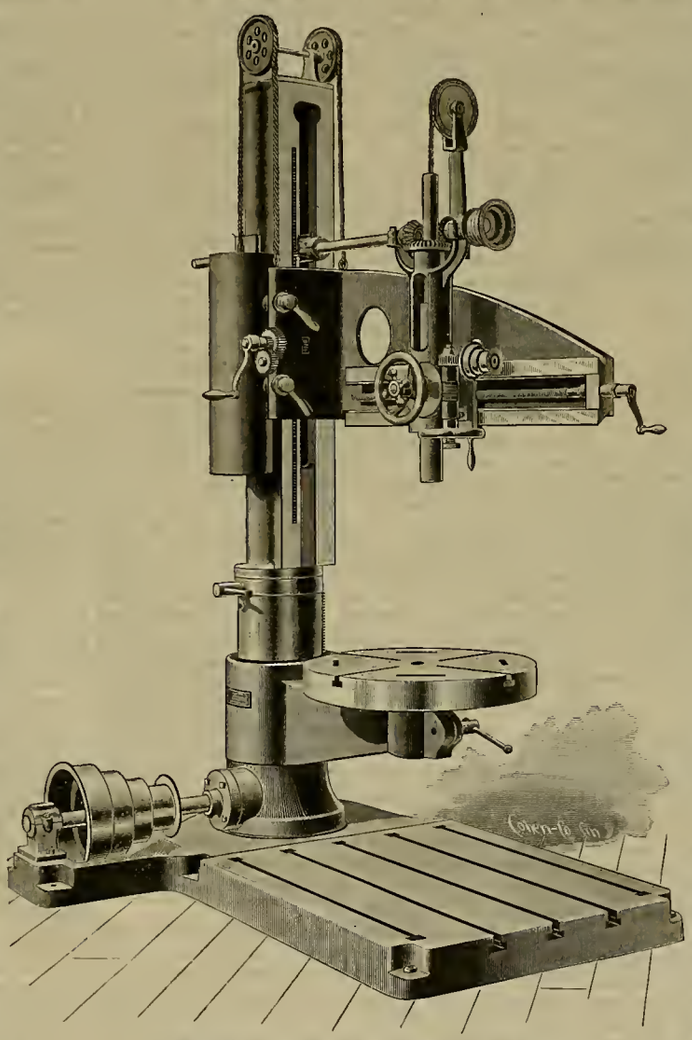
Combined Upright and Radial Drill.

These drills are built by Messrs. Dietz, Gang & Co. of Cincinnati, Ohio, and are represented in this city by the Joshua Hendy Machine Works of No. 51 Fremont street. The accompanying cut represents the combined upright and power feed radial drill provided with the latest improvements, as well as containing all of the commendable features that should be embodied in every first-class tool of this character. The machine is driven from cone pulleys, as shown in the cut, by means of bevel gears running one to three, the larger of which driving the vertical shaft through inside of column, connecting with the horizontal shaft by means of mitre gears cut from solid steel. The horizontal shaft is connected by means of bevel gears, running one to two for driving the spindle. By this gearing the spindle is extremely powerful, the cone running five revolutions to one of the spindle; for this reason the machine does not require back gear, but must have two driving pulleys on countershaft, one running 400 revolutions and the other 200 revolutions. All holes up to 1¼ inches can be bored with the 400 speed and all holes above or counterboring will require 200 revolutions. This machine is furnished complete with countershaft containing two of the best friction pulleys made, thus enahling the operator to change the speed immediately. The feed is simple and powerful with quick return attachment. The column is made in two parts, the upper one being fitted in a stationary stump which supports the table arms and table. The table revolves all around the column, and thus can be used in any position. The upper column snpporting the gibbed arm with spindle head, has full circular movement depending, however, upon the position of the driving belt. The cone pulley has four speeds, the largest being 12 inches, the smallest six inches all for 3-inch belt. The machine is thoroughly balanced by weights on side of column, thus enabling the operator to change the position instantly. All lug bolts have lever attached, doing away with wrenches. Square tables with T slots furnished instead of round table, if desired. Diameter of column, 10 in.; height of column, six feet, six in.; drills to center of 52 in.; vertical adjustments of arm on column, 28 in.; receives under spindle over base four ft., four in.; receives under spindle, over floor, four ft., nine in.; height of table from base, 20 in.; size of table, 30 in.; adjustment of table arm on lower column, eight in.; diameter of spindle, one and eleven-sixteenths in.; spindle hored to fit Morse Taper, No. four; traverse of spindle, 11 in.; size of two friction pulleys, 12 in.; speed of countershaft for holes below 1¼ in., 400 revolutions; speed of countershaft for holes above 1¼ in., 200 revolutions; width of belt for cone pulley, three in.; floor space for base, three ft. x six ft.; weight of machine, about 3,200 pounds.



COMBINED UPRIGHT AND RADIAL DRILL.

THE famous Delamar Mining Co., of Idaho, is threatened with an apex suit that may become famons in the history of mining litigation. Tim Regan, owner of two-fifths of the Stoddard property, claims that it holds the apex of the Delamar Company's ore hodies. He has recently been doing some work to prove his theory, and expects soon to commence a suit for an accounting. A very large amount of money will be involved.

THE Medford River Mining Co., working a rich claim in Klamath river, between Shasta river and Humbug, has sold out to a Portland company of capitalists. The new mansgers are now operating it on an extensive scale, with Wm. R. Price, of Yreka, as business manager. The claim is now known as the Americau Bar claim, and it is expected considerable gold-dust will be taken out before the winter storms, with a likelihood of continuing operations all winter, unless extraordinarily heavy storms occur. The river does not interfere with claims above Humbug, in winter, as helow that point, on account of swiftness to prevent its overflow during ordinary storms.

CAPTAIN HACKETT, who was recently awarded the large Government contract for dredging the Oakland harbor, says that he will not get to work before the first of February. He will dredge a 300-foot channel, with 20 feet of water at low tide, from the old narrow-gauge slip to Webster street, and then from the foot of Sixth avenue to the cotton-mills, at a depth of 10 feet. The material dredged will be deposited on the marsh. They are now huilding the supports for the pipe off the railroad tract down by the freight-landing.

Work on the Newly Projected Geological Map.

The trustees of the State Mining Bureau are just now debating the question whether or not it will be best to proceed with the work already begun on the geological map of California or delay the same for an indefinite period. The question to be considered is one of finance; the members of the board are desirous that the work should go on without interruption and will vote to that effect if satisfied that the funds can be had to defray the expense of its continuance. State Mineralogist Irelan is of the opinion that the necessary funds will be forthcoming and advises that the work be kept up without intermission, and that thisshould be done if possible admits of no doubt.

Nearly two years ago the State Mining Bureau, having the preceding year collected the requisite data, published a geological map of this State, the same having been projected on a scale of 12 miles to the inch. This was termed a *preliminary* map for the reason that it was regarded as merely the initiative of more extended and perfect work afterward to be done. The fragmentary work done byProf. Whitney was adopted as the basis of the new map, that is, so far as it would go. To this was added a large amount of original matter collected by geologists sent into the field for that purpose, a very complete and accurate description of the mother lode forming a portion of the material so collected. This entire data having been incorporated into the new map the latter constitutes a valuabe addition to our geological knowledge of California.

To this map during the past yesr further additions have been made; the geology of more than two-thirds of the State having undergone revision and enlargement, producing what has been aptly termed the *progressive* geological map of the State. On the first map, each of the several geological formations laid down are made to cover large areas, whereas, on this more recent work these formations have undergone much correction and subdivision, besides which a large extent of new territory has herebeen represented. This revisionary work extends over the entire coast tier of counties, the great interior valleys, the main gold belt and the group of counties occupyingthe extreme southerly end of the State. Not only is thegeology of this whole region laid down with considerable minuteness, but the localities of the more important metals and minerals occurring there are denoted.

As this new map promises to be of much interest to science as well as a great utility in an economic point of view, especially to the prospector and the practical miner, it is to be hoped that the trustees of the Mining Bureau will be able to see their way to a continuance of work upon it; the more so in that this work need not, as we are assured, be attended with any great expenditure.

SEVERAL teams are hauling freight from Oroville to the Shakespeare mine at Forhestown. The reduction works being put up there are the largest in northern California, and the amount of material that goes through Oroville for that point is enormous.

A SIXTEEN-OUNCE nugget was found in the South Fork mine at Forest City, Sierra Co., last week.

Comment.

THE defendants in the case of M. W. Fox *vs.* the Hale & Norcross Silver-Mining Company have filed an appeal bond with the county clerk in the sum of $2,300,000. The bond is furnished by the Western Surety and Guarantee Company. The heavy amount of the judgment allowed Plaintiff Fox, by Judge Hebbard, over $2,000,000, made it necessary that a correspondingly heavy bond should be given. The plaintiffs now object to this bond on the ground that the Surety Company is only incorporated for $100,000. More time is to be given to file a new bond. The whole matter will, in the end, go before the Supreme Court.

The goldminers of California, who have contributed to the wealth of the nation upward of twelve hundred and sixty millions of dollars of that precious metal which is the basis of values all over the world, now, for the first time in history, ask the assistance of the Government to enable them to prosecute their business in such a manner as to avoid injury to the rivers or the valley of the State. The committee of engineers appointed specially by Congress, at the request of the Legislature of California, having reported feasible plans for restraining the mining debris, it remains but for Congress to see them carried out in order to harmonize the interests and set free the hidden millions in the hills. It is very certain that during the coming session of Congress definite action will be taken either on the Caminetti bill or some similar measure. The time has come when the necessary laws should pass which will permit the hydraulic-miners of this State to once more turn into the channels of trade the million dollars of new gold a month, rehabilitate the mining industry, repopulate the partially deserted mountain towns, and bring prosperity to those camps throughout the Sierra Nevada which have for years been in adversity through the enforced cessation of hydraulic-mining. The recent decision of U. S. Circuit Judge Gilbert in the North Bloomfield case, respecting muddy water passing over dams, removes the only objection the U. S. engineers could see to the remedial measures proposed.

The low price of silver has caused mining people on many sections of this coast to turn their attention to prospecting for and developing purely gold properties. This is a good thing for California, which is still the leading goldproducer of the United States. There are thousands of prospects all over the State which only need capital to be properly developed and tested. Well-outfitted producing mines are held for investment by their owners and few are for sale. It is generally the undeveloped claims which are for sale. If people want gold claims they can find plenty of them here, but they must put their money in and test them. They cannot get a rich and well-equipped gold mine without paying a good round price for it. Many of the counties of California which are away from the main lines of railroad travel offer good inducements for investments, if capitalists would send their agents out to hunt up claims. They need not be prospected for, since many have already been found. What is needed is men of means to take hold of the undeveloped claims now held by poor prospectors. There is always an unchanging market for gold, but the only way to get it from a mine is to dig for it. This costs money in the first place, and money is what few prospectors have. If the men with money will help the prospector, it will be a good thing for them both and for the State.

The Executive Committee of the new State Anti-Debris Association has been visiting some of the mines to see whether or not the miners are trying to care for their debris. The party consisted of A. H. Wilbur, the general manager of the Anti-Debris Association; Will S. Green, editor of the Colusa *Sun* and an active member of the association; Supervisors Andrew Black, E. Greer and Geo. O. Bates from Sacramento county; D. H. Arnold of Colusa; L. P. Farnum of Sutter; E. Fagan of Butte; W. Phipps of Marysville; N. B. Kirlley of Yuba City and D. P. Durst of Wheatland. C. W. Cross, attorney for the Bloomfield Mining Co. and G. H. Magruder, an agent of the Anti-Debris Association, accompanied the party. Mr. Bates, the Sacramento county supervisor, said that each trip that he made to the mountains convinced him more strongly of the necessity of friendly relations between the farmers and miners. If a freedom of conference and general confidence and good-feeling could be established between them, the debris question would be practically settled. He believed, under such circumstances, the miners would do almost anything to impound their debris. Supervisor E. Greer said: "The miners seem to appreciate the situation, and they are building dams to restrain their coarse debris and settling pools for the finer material. They appear to be in earnest in their professed desire not to pollute the streams to a dangerous extent, and so far as we could judge, are striving to that end. The committee was impressed with the idea that, by the methods which the miners are adopting, the mines—or some of them at least—can be operated without injury to the rivers or valley lands. The miners are evidently disposed to take care of the tailings from their mines, and will be given an opportunity to test their methods. The editor of the Sutter *Independent*, in giving his opinion, says: "As to the North Bloomfield, there is no doubt that a considerable portion of the debris from the mine can be restrained in the settling-pool for a limited time, provided the mine is operated in good faith. At the same time the facilities are at hand for the exercise of bad faith, in the shape of a bedrock tunnel which opens directly into the mine and discharges into a tributary of the Yuba river; all the tailings can be run through this tunnel much more cheaply than the material can be elevated and run into the settling-pool. Of course to do this would be bad faith, and would be in contempt of court, but the fact that it can be done is matter for the grave consideration of the people and the Anti-Debris Association. We do not say it will be done, but the temptation will be strong.

All of these gentlemen, being dissatisfied with Judge Gilbert's decision, were looking for themselves to find if the debris was really bsing impounded. They do not seem to have been able to find anything wrong, although they evidently looked for it. Few of them know anything about hydraulic mines, and are "posting" themselves. Messrs. Greer and Bates, of Sacramento, are well disposed toward the miners, but the others have strong anti-debris prejudices difficult to overcome. However, they were unable to find anything to show that the miners were not acting in good faith to obey the decrees of the courts. The bedrock tunnel of the North Bloomfield is not used, and is not likely to be. That company has had trouble enough in the past. Many other mines will impound their debris as soon as they can arrange for it, since they are all anxious to work again

The Shasta County Miners' Association are carrying out rather a good idea at their headquarters in Redding. Secretary Hodson is collecting specimens from all the mines in the county, arranging and classifying them on shelves, and keeping them in a condition for reference by any one desirous of information. He has gold ores, silver, coal, iron, chrome and everything else found in the county. There is also a colored geological map which he has prepared, and any one can see the formation in which the mineral is found. Those desirous of investing in mining property may see the character of all the ores and mines and be directed to the ground. The collection is only intended to represent Shasta county, and is already of great interest. Dr. Hodson, the secretary, is an earnest worker and is gradually making a very valuable collection. The example set by the Shasta County Association might well be followed by other miners' associations in the State.

The days of rich pockets and nuggets are by no means over in California. For instance, a few weeks ago they got $10,000 out of a pocket in the Stow mine, Forbestown, Butte county, and the mine since made a cleanup of $20,000. Henry Miller, of Magalia, in the same county, found a little pocket in his claim from which he took out in a few minutes $580. Ed. Gilbert found in his drift mine near Butcher ranch, Placer county, a nugget worth $2300. It was about ten inches the long way, from three to seven inches in width and from an inch to an inch and a half in thickness. The whole surface was very irregular. Its beauty consisted of having the formation of crystallized quartz, with clear-cut corners, the sides of whose cubes shone with dazzling brilliancy at any angle from which a person viewed it. The mine has been worked more or less since 1856. Louis Page and partners at Bald mountain, Tuolumne county, after working a tunnel for 19 months, have struck several very rich pockets where they have found nuggets worth $40, $80 and $140, and lots more in sight. These are only a few instances seen in our exchanges in the past week or so, and there are doubtless others not chronicled. There are thousands of Chinese working in the mines of the State, but no one ever knows what they get; and in the richer claims run by white men little is said of the product. The gold-mining interests of California are becoming better recognized than they have been of late years. The northern counties are only partly prospected, and even in the older mining regions there is room for discovery. There are many mines being worked steadily by private parties which are paying handsomely, but as no stock is for sale, very little is said of them in the public prints.

Cable Railroad Patents Upheld.

The United States Circuit Court of Appeals, for this circuit, on Monday last, affirmed the decisions of the Circuit Court in favor of the Pacific Cable Railway Co., in suits brought by it against the Consolidated Piedmont Cable Co., of Oakland, for infringement of patents. The patents sued on were for a grip and for a tension apparatus. The former device was patented by Wm. Eppelsheimer, No. 189,204, dated April 3, 1877, and the latter wss patented by Henry Root, No. 244,147, dated July 12, 1881.

The grip is of the type known as "bottom grips," which implies the seizing of the cable from directly above, instead of taking it from the side, as in the Market street grip. In the Eppelsheimer grip there are two jaws, hung from the same center. In the grip frame is a slide-bar, to the lower portion of which are secured bearing rollers, which act upon the outside of the jaws to force them together, as these rollers, bearing up under pins in the jaws, open the jaws again. This grip is a practical one, and has for many years been in use on the Geary street road in this city. The grip used by the Piedmont road is also a bottom grip. Its jaws, main and slide are substantially similar to the corresponding parts of the Eppelsheimer grip. Instead, however, of the bearing rollers, to transmit the power of the slide to the jaws, the Piedmont grip makes use of connecting pins in an arrangement which may be termed a bell crank. This arrangement was held, by both the lower and upper courts, to be an equivalent of that of the Eppelsheimer grip, and consequently an infringement.

The Root tension apparatus is in general and extensive use. It is familiar to all who have visited the Market Street Cable Railway powerhouse. Its purpose is to take up the slack of the constantly-lengthening cable, and to keep it taut at all times. The cable enters the powerhouse and passes around a large sheave, which is carried upon a car to which a chain is secured, which suspends a weight in a pit. The weight keeps the car continually pulled back, and thereby maintains tension on the cable. But as the depth of the pit is the limit of the descent of the weight, and consequently of the retrogression of the cable-pulley car, it is evident that some means must bs provided to raise the weight again to continue its effect. To accomplish this, there is a second car or frame, which carries a pulley over which the weight-suspending chain hangs. This second car or frame is, at times required, pulled back by power derived from the cable itself, so that its pulley, passing under the chain, raises the weight to the top of the pit again. Thus there is perpetual and auto-

matic compensation for the stretching of the cable, which is thereby kept under the required tension.

The device used by the Piedmont Co. the court holds escapes exact similitude by a few changes of form, which do not affect the principle or mode of operation or the relationship of the parts, and is consequently an infringement. The Court of Appeals also holds that the Root device was a patentable invention, thereby sustaining the validity of the patent.

The Pacific Cable Railway Co., which owns these patents, is also the owner of a large number of cable-railway patents, chiefly those of the early state of the art, and which have always been regarded as the controlling patents of cable-railway construction. The company is the outgrowth of the consolidated patent interests of the pioneer roads and inventors. Its list of patents includes the primary inventions of Hallidie, the pioneer of the cable-road, whose practical expressions are familiar to all in the old Clay Street road; the patents of Hovey and Casebolt introduced in the Sutter Street road; the inventions of Eppelsheimer in the Geary Street road, and those of Root in the California and Market Street roads, and many others of later date.

The Foundry Business in San Francisco.

According to the idea of Mr. Irving M. Scott, of the Union Iron Works, the iron-manufacturing business in this city is not suffering so much from a depression of trade as it is from the methods employed in supplying the wants of the purchaser. Twelve years ago a great many articles were manufactured that to-day are imported, and while the business of the small manufacturing establishments has fallen off very greatly, the business of the importer of iron goods, as evidenced by the number of establishments now in successful operation here, has increased, so that, instead of the trade being greatly reduced, it has simply been transferred from the original manufacturer to the importer. The remedy for this would be, Mr. Scott thinks, the manufacturing of goods on the most improved type in vogue elsewhere, which we have not as yet in our State, even in the slightest degree, and we are working at arms-length and by rule of thumb, as we did 20 years ago. Rapid and cheap transportation by water and distribution throughout the State, which will enable us to market the goods manufactured, and a competing line that will bring us skilled labor at low rates, will enable the manufacturers of this coast to hold their trade and successfully compete with any part of the United States, and will be of great advantage to the permanent and healthy growth of the community.

While the other foundrymen of the city will doubtless agree with Mr. Scott that cheaper labor and cheaper means of distribution of product will benefit them, they will hardly be willing to admit the working "by arm's length and rule of thumb" proposition. As to the "manufacture of the most improved types of machinery in vogue elsewhere, which we have not in this State," the eastern concerns have taken up specialties while the works here have, by force of circumstances, had to do any kind of work which came along. It is only of late years they have been taking up specialties. The Union Iron Works itself made a hit in the way of ship-building and repairing, and it is in this department only that the works are especially busy at this time They still do general work, of course, but the other departments are now of minor importance comparatively.

The specialty of most of the larger foundries of this city was for years mining and milling machinery, and they attained an enviable reputation in this line. But their special methods, designs and patterns, the result of experience, were in time appropriated by others. A complete set of drawings, for instance, taken without leave from the Union Iron Works, on one occasion, served to start a shop in New York. There were few patents to protect the originators, and most of what there were have run out.

Our market for this class of machinery was gradually narrowed by railroad rates. Transportation from eastern points was much cheaper than from this city, and is to-day. We formerly shipped to Utah, Montana, Idaho, Oregon, New Mexico, Arizona and Mexico. To some extent, we do still, but the Northwest is now mainly supplied from Chicago. Our foundrymen now have to drum up trade in Mexico, which formerly came to them unsought.

Certain types of engines, made in different eastern cities by concerns which make them a specialty, are sold here cheaper than we can make them, without counting freight. Of course, under such circumstances, our local foundries cannot sell a homemade engine if a man is looking for a cheap one. Of late, therefore, in order to compete with the machinery importers, some of the larger foundries—the Risdon, for instance—have commenced to keep these ready-made engines and some other machinery in stock. A purchaser may have an engine, pump, etc., made to suit his special requirements or take one ready made of eastern make.

The fact of the matter is, our local iron manufacturers are handicapped by four features, high labor, high-priced coal, expensive iron and exorbitant freight rates. Not very many months have passed since they had a long struggle with the labor problem. They came out victorious, but the effects are yet felt in loss of business.

Most of the coal we get comes from foreign points and pays a duty. We produce no iron to speak of on this coast, and this must all be brought here from the East or abroad. When we start to ship machinery to points in or out of the State, we find a forbidding freight schedule. With cheaper labor, coal, iron and freight rates, Chicago foundries have captured a great deal of trade formerly ours.

Now, while we may manufacture certain specialties successfully—as we do, and as "good as the most improved type in vogue elsewhere"—especially water-wheels, gas engines, roller-mills, concentrators, ore-feeders, wrought-iron pipe, hydraulic nozzles and elevators and a few other things, we cannot, under present railroad, coal, iron and labor conditions, take up the general classes made by eastern works. We could not compete with them in those lines now, nor can we until the difficulties spoken of are removed.

Coast Industrial Notes.

THE West Almaden Quicksilver Mining Company has been incorporated at San Jose, with a capital stock of $10,000,000.

PORTLAND city council is considering a proposition to collect a monthly tax for each horse, cable or motorcar in service on the streets of that city.

THE Reno Electric-Light and Power Company of Reno, Nevada, has levied an assessment of 50 cents per share, delinquent November 10th.

THE large furnace of the Bishee, A. T., Copper Mining Company, being under repairs, between fifty and seventy-five men have been laid off for a month.

THE San Antonio Electric Light and Power Company has completed its plant, and is now furnishing Pomona and San Bernardino with the neccessary illumination.

THE Pioche Record says the smelting works and mines have closed down and the citizens have taken to reading Goldsmith's "Deserted Village." There is only one man left in Jackrabbit district.

THE poultry and eggs shipped from Petaluma to San Francisco during 1891 amounted to $1,200,000, the dairy products to over $1,000,000 and the hay, vegetables fruit and livestock to even a greater sum.

ABOUT 2000 carloads per month of red cedar shingles are being shipped East from various Puget Sound points. The eastern market instead of being overstocked can hardly be supplied and the demand is increasing in every quarter. With the new rates to go into effect January 1st, an equally big demand will be created for sawed fir and cedar lumber

THE Oakland Consolidated Street Railway Company has started an innovation that will be welcomed by the people. The company has had air-brakes placed on its cars, which are easily worked by the motorman. A test was made and it was found that a car going at full speed can be stopped in about 20 feet. The brakes will be of great value in case of accident.

AT the Spenceville copper mine and works, Nevada county, now reorganized under the name of the Imperial Paint and Copper Co., they are getting new machinery and the work of enlarging the capacity has already been commenced, and, as soon as possible, they will be turning out mineral paint, pure copper and bluestone in larger quantities than heretofore.

THE Dayton *Times* states that Al Holman has made a discovery of an alum mine in the Como range of mountains near the old Whitman mine. From what work he has done on the ground he believes that there is a very large deposit of the material. He sent some of the croppings to the Experiment Station at Reno and finds that the test shows that the sample contained 35 per cent of pure alum.

THE San Joaquin Valley Railroad has been leased by the Southern Pacific Company and will hereafter be known as the Fresno and San Joaquin Branch of the San Joaquin Division. The stations on this branch are as follows: East Fresno, Barton's Spur, Las Palmas, Eggers Spur, Tarpey's Spur, Clovis, Gordon and Pollasky. An agent has been placed at Pollasky and freight to other stations must be prepaid.

DAVID DYSART, who has charge of the National Ice Company's works at Floriston, near Boca, and in Nevada county, is about to put in a new dam for his company and that will form an ice-pond of great capacity. Chas. E. Uren has just completed the surveying for the big new dam. If the weather is favorable there will be a tremendous ice-crop harvested during the coming winter—larger than has ever been the case in all the past.

THE big wharf of the Southern Pacific Company at Santa Monica is now 2000 feet long. The wharf has recently been inspected by representatives of marine insurance companies of the coast and of clipper lines operating between San Francisco and New York. It is expected that a large additional area of land between Los Angeles and the ocean will be planted with cereals this fall for direct shipment from the new wharf which it is understood will be completed by March next in time for the coming season's crops.

THE San Jose Mercury says that eastbound freight shipments continue to go forward in large quantities. The total shipments last week amounted to over 3,500,000 pounds. Dried prunes took the lead last week, 1,418,400 pounds being sent forward. The greater portion of the prune crop has been shipped, and hereafter smaller shipments will be the rule. The shipment of canned fruit will probably continue to be heavy until the middle of December, as the canneries are still busy packing grapes and other late fruits.

WORK at Stockton on R. R. Smith's new dredger, which will cost $15,000, will commence in a few days. W. D. Delaney will superintend its construction. Another dredger, to cost $25,000, will be built in Stockton to be used in leveeing on the Sargent tract. It will be constructed for the following named owners of land on the tract: Eugene Wilhoit, L. E. Cross, D. A. Guernsey, M. D. Eaton and Stewart, Williamson & Derrick, Samuel Miller, Nathan Greer, Dr. F. R. Clarke, H. E. Williamson and W. B. Matthews. All the levees around the land owned by these gentlemen are to be strengthened. E. F. Cadle & Co. have the contract for building this dredger.

IN view of the difficulty of classifying imported coal as either "bituminous," containing less than 90 per cent of carbon and dutiable at 75 cents per ton, and "anthracite," entered free of duty, such difficulty arising because of slight variations either in the percentage of the carbon actually contained in the different samples of coal taken from the same mine, the Treasury Department suggests to the San Francisco collector that coal mined in a region known to abound in anthracite coal and similar to that which has heretofore been admitted free of duty may in future be classified as "anthracite," if the quality of fixed carbon contained therein as shown by analysis shall not fall below 88 per cent.

THE largest wire-nail machine ever built in the United States was finished recently at the works of M. M. Smith, Greenpoint, N. Y. After thoroughly testing the machine it was shipped to the Puget Sound Wire-Nail & Steel Company of Everett, Wash. The machine weighs 12½ tons, and will make nails weighing exactly ½ pound each at the rate of one a second. These nails are 7 16 inch in diameter by 12 inches in length, this being the largest size turned out by this machine, which can be adjusted to any length less than this. Nails of any length desired can be made by simply adjusting the feed, no change whatever being necessary in either the headers or cutters. This will be understood when it is stated that the wire is fed to the machine from a coil, the operation being very similar to that followed in the machines making small wire-nails.

THE residents of San Diego are in favor of a road affording them a direct eastern outlet, and the project to run a line to Phœnix and Denver has been often broached. A late San Diegan, who has become a resident of Pœnix, Ariz., has again started the ball to rolling by inviting the owners and managers of the Cuyamaca road to visit Phœnix for the purpose of agitating the question. Two routes are spoken of—one straight down the Salt River valley to Yuma, requiring very little grading, and the other to go via Vulture and out through the Harqua Halas, opening up one of the richest mining regions of Arizona. The latter route would utilize the Santa Fe, Prescott & Phœnix road as far as the Vulture, a distance of about 40 miles. The former route would develop more the immense agricultural resources of Maricopa and Yuma counties. An engineer is now going over the proposed route through the Harqua Halas, and there is no difficulty in finding an easy grade.

THE new fire boat built by the Fulton Iron Works for the Harbor Commissioners was tested last Saturday, Both engines and pumps were tried and did their work splendidly. The boat left Clay street at ten minutes past ten and made the trip to Alcatraz, under ninety-five pounds of steam and the engines making eighty revolutions a minute, in nineteen minutes against the tide. After passing Alcatraz the steam was raised to 120 pounds and the engines made ninety-two revolutions. The engines ran smoothly and the boat was stiff and very steady in the water. She behaved admirably when the landing was made. The fire-boat made fast to the wharf of the Pacific Yacht Club and the pumps were tested by Captain Farley and the fire crew. One and a half and two inch streams were thrown to a distance of 100 feet easily. The connections were tried singly, in pairs and all eight at the same time. All tests were most satisfactory and show that the boat will be very valuable in case of a large conflagration on the water front.

ON Sunday morning the main west works of the Patent Brick Co., situated on the line of the San Francisco and North Pacific Railway, and about three miles from San Rafael, were discovered to be on fire, and in less than two hours, in spite of the prompt and efficient aid of about two hundred men—mostly employes—the whole west plant, covering about two acres, was totally destroyed. The company has just renovated the works at a cost of $7000, and the total loss is estimated at about $16,000. The plant is the largest of its kind in the State, as it employs on an average 150 men, with an output of 75,000 bricks daily. The brick is dried entirely by hot air, and the works, being entirely covered, are allowed to run the year round, unlike the other brick companies, they being compelled to close down during the winter season. The company is at present building a new plant in the eastern end of the yard, and as this is nearing completion, the works will be in running order in a very short time. The works burned down will undoubtedly be rebuilt.

Personal.

W. E. SHARON, the Comstock mine superintendent, is visiting the city.

ROGER PRENDERGAST, who has been at Bartlett Springs for some time, has gone back to Virginia city.

PROF. E. E. BARNARD of the Lick Observatory, lectured this week before the Geographical Society of the Pacific on "Recent Visual and Photographic Astronomy."

R. T. ROOT, C. W. Barry, Judge and John Blakely have gone from Kingman, A. T., to White Hills to examine the mines of that place and gather in specimens for the World's Fair exhibit.

DAVID MENZIES, who has been employed at the Union Iron Works in this city for many years, has gone to Chicago as assistant superintendent of the Chicago Shipbuilding Company.

GEORGE ATTWOOD and Mr. Reynolds, of London, have bought the Rattler mine and mill at Fairview, British Columbia, and also the Brown Bear, Ontario and Wynn, all gold properties. They have secured land on the Okanogan river for the mill-site, etc.

E. F. DICKINS of the U. S. Coast and Geodetic Survey, left for Coos Bay, Oregon, on Wednesday. He has been engaged in work on the upper coast all summer and only returned a few days ago. His present trip will be a short one, for he will be engaged in office work in the city this winter.

CHAS. R. WEBB, representing parties interested in furniture factories in Michigan and Chicago, has been visiting this city with a view of starting a large factory here, for both costly and cheaper grades of furniture. He seems to be favorably impressed with the situation and goes East this week to report to his principals.

Mines and Mining in Nevada County.

By Our Traveling Correspondent.

Part II.

GRASS VALLEY, Oct. 10, 1892.

TO THE EDITOR:—Some years ago, mining about Nevada City and Grass Valley was greatly relieved and stimulated by the building of the South Yuba canal, by which water was substituted for steam as a motive power. Many new enterprises sprang up that had been unable to meet the expense of a steam plant, and these districts entered on a new era of prosperity. But again a call is made for "cheap power," and within another year Grass Valley and Nevada City will have a system which for cheapness and efficiency will doubtless be unparalleled on the coast.

The projected introduction of electricity seems most timely. Rates have gradually risen till waterpower has assumed nearly the early prohibitive rate of steam. The company first furnished water for 15 cents an inch. Some of the miners have contracts now for 18 cents, but it is doubtful if the contracts will be renewed at this rate on their expiration, as one of the largest mines, its contract having expired, is paying 23 cents an inch, and unable to get a contract for any continued period even at that rate! The water company has evidently foreseen that electricity was destined eventually to succeed them, and they are making preparations accordingly. By a plan not yet given to the public, it is intended to convey 1200 inches of water to the irrigation districts of Placer and Sacramento counties, where, it is said, double the price now paid by the miners will be obtained. The plan is already being carried into execution. The great dam the company is constructing below its present Fordyce works will collect the water from an immense watershed and furnish the water contemplated for the new project. This also will necessitate, of course, the widening of the present canal, the building of additional ditch, etc. Owing to the absence of the manager from town, I was unable to secure full details of the project.

Even with waterpower at hand, the mines are dependent on steam for several months each winter, as the water, coming from above the snow belt, freezes; hence it is necessary that each mine have a steam plant anyhow, as the pumps must be kept going continually. The obvious advantages of electricity are universally recognized and its introduction gladly welcomed. Properties inaccessible to water and unable to afford steam can readily avail themselves of the new power; but there is no need of entering the field of prophesy or conjecture. Nearly every one, and that includes a great many present inoperatives, is preparing to utilize the force. Time will give the result.

TWO ELECTRIC-POWER COMPANIES AT WORK.—As may not be generally known, two companies are preparing to bring in electric-power. The only one so far to make known its intentions to the public—in fact the only one that as yet has assumed business proportions—is that of Alf Tregidgo, whose plans have already been described in the PRESS. Mr. Tregidgo intends taking water from the South Yuba below the "ice belt." Two miles above Pindoa bridge, where the river narrows, work has begun on the dam, which, resting on bedrock, will be 40 feet wide on bottom, 150 at the crest and 27½ feet high; thence a canal, four miles in length, will be constructed. A pressure of 380 feet will be thus obtained to run the dynamos on the bank of the river below, whence the power will be transmitted to the mines. The capital for the enterprise is secured and the projectors are sanguine of the completion of the work by next spring.

Mr. M. C. Taylor, the Grass Valley foundryman, has also been perfecting a scheme, and if its ultimate intentions are carried into successful operation, it will surpass anything yet conceived in this State for long-distance transmission of power.

By his plan, a dam will be built in the main Yuba, about 50 yards below the junction of the North and Middle Forks. All the preliminary rights of water, amounting to 10,000 miners' inches, and a dam-site, are secured. The dam will be a permanent structure of rock and cement, 220 feet long, 12 feet high, 12 feet at base and 6 feet at top. A canal, 10 feet wide and 4 feet deep, with a ½-per-cent grade, will carry the water about seven miles. At the end of this canal a perpendicular fall of over 500 feet will develop a power equivalent to one-horsepower for each miner's inch, or 10,000 horsepower. The preliminary survey for dam and canal has already been made. It will be necessary to construct 2½ miles of flume, owing to the precipitous route, and a roadway must be blasted along the mountain upon which the flume may rest, thus lessening the liability to accident. The water-flow will be unceasing and the power free from interruption on accouot of ice, as the works are all below the snow-belt. Steps toward the formation of a company are being taken, for the purpose of making available sufficient power for the immediate use of Grass Valley and Nevada City. The estimated cost of this is $60,000, and the time required to construct the work as planned is two years. These districts will certainly not want for cheap and abundant power.

Mr. Taylor, however, looks beyond the mere local supplying of power, and anticipates that by the time the work thus first contemplated is done, science will have so eliminated distance as a militating factor in electrical transmission, that the full power at hand may be conveyed to San Francisco and furnish the major portion of the power necessary for the present electric and cable systems, foundries, mills, etc., at far less cost than this power can now be generated at home. There is certainly nothing visionary in the scheme, as far as concerns its practicability. At Frankfort-on-the-Main, Germany, electricity has been transmitted a distance of 110 miles, securing an actual efficiency of 75 3 per cent, and that with a small and defective plant.

Mr. Taylor's scheme is a comprehensive one and calls for more capital than may immediately be forthcoming. But surely no better investment is open to capital on the coast, and the immense value, both to the commercial and manufacturing interests of the State and to those who may make the undertaking, cannot be overestimated.

THE GRAVEL MINES.—Aside from the introduction of electric power, the latest feature in mining about Nevada City is the more general adoption of milling methods by the gravel mines. Drift gravel mining in this section has only within a very recent period attracted any considerable attention. Just north and east of town is a rich channel, running east and west, that yielded well in the hydraulic days of the past. The gravel differs from the cement character of the material of other localities where crushing is in vogue, as on the Forest Hill divide or at Bangor, and has heretofore been considered free-washing. The first mine here to make the innovation was the Harmony. Gravel that averaged at most $1.50 a car when washed, was found to yield $6 to $13 when milled. The obvious advantages of crushing have led to the erection of a ten-stamp mill, which has been completed within the past two months. The present company, a Nevada City corporation, Geo. Hothersole, superintendent, has been developing for the past two years. The mine is opened by a 30° incline, 320 feet deep, and thence by a tunnel 740 feet to the channel. Breasting at present is in the west drift. The channel is here from one to five feet in thickness and widens to 240 feet.

THE WEST HARMONY adjoins the above mentioned mine on the west and is owned principally by W. W. Stow. Here a ten-stamp mill has just been completed also. The channel is reached through an incline 565 feet deep and a north tunnel of 700 feet.

Both mills are said to be giving excellent satisfaction, and will douhtless lead the other mines to adopt the same methods. Mr. W. W. Stowe also owns the adjoining Tip Top mine, as yet a prospect.

THE MANZANITA mine is on the same channel as the foregoing. Mr. Robert Simmons is superintendent. This is also a new enterprise but has not yet erected a mill. There is a 12° incline of 225 feet, and, from the bottom, a tunnel 650 feet into Washington hill. The channel is expected within a few more feet. This is a very large property and possesses valuable water rights. New waterpower hoisting works will soon succeed the present crude plant.

THE ODEN is another mining company lately started on the channel and in what is believed will eventually prove a good mine. It is a San Francisco corporation. The Centennial is another promising mine with a 2500-foot tunnel. So much for gravel mines.

For quartz the outlook is quite as favorahle. The principal mines lie to the west of town on Deer creek, on parallel north and south ledges and on the line of contact of slate and granite.

THE MOUNTAINEER mine, W. A. Dennis, superintendent, is reserved in its statements to the public. It is a steady dividend-payer and has run for the past dozen years. It has a 20-stamp mill and six Frue concentrators. The sulphurets vary from $80 to $170 and are sold to the highest bidder. During the past year the 850-foot level has been opened.

THE CHAMPION lying west of the mountains is the best-paying mine in the Nevada City district and one of the best in the county. Mr. F. Zeitler is superintendent. Fifteen stamps are now adding, which will make the mill one of 30-stamps. New and concrete foundation has lately been put under the mill; four frues will be added to the seven already in use and a 5-foot Dodd-water-wheel will take the place of the present 6-foot Pelton in running the stamps. This company has introduced with the new batteries the patent stem–guides of the Union Iron Works by which in case of accident one stamp can be removed quickly without dismantling the other four or stopping the whole mill. The large reverberatory furnace 70x13 feet has been rebuilt. The mill will be as modern and complete as any in this section of the State.

The shaft is down 1000 feet and stoping is going on in all levels, north and south a distance of 400 to 900 feet. The rock is 6 per cent of sulphurets, carrying both gold and silver in the ratio of 15 oz. of silver to $100-of-gold. The silver is obtained by the "hypo" or "Kiss" process; i. e., after chlorinating, and the gold extracted, the tailings are further treated to a leaching process of hyposulphate of soda. This is the only mine in the county where the silver is saved; in fact it is the only one that carries any considerable quantity of silver. Further, it is the only mill that has its own chlorination works. Mr. A. Maltman an experienced assayer, is in charge. Mr. Maltman is also agent for the Portland, Or., Smelting Works, and has made several large shipments of concentrates from mills in the district with better returns than these mills have heretofore obtained.

THE PROVIDENCE.—Previous to a year ago the mine had been idle for three years, during which time it had fallen into a dangerous condition. The present company, Col. Carl Davis, superintendent, took charge 11 months ago and has spent nearly $50,000 in improvements and developments. The old shaft of 1150 feet has been retimbered and sunk further about 200 feet and the old works cleared out. They are now opening up the 1400-foot level, running south 350 feet with 300 feet more to go to strike the chute previously worked from the surface to the 1200-level. New pumps complete and a 12x20 Burleigh compressor have been put in. From the 1200-level a crosscut to the back ledge, or Ural ledge, was run 600 feet west. On the Ural it is further intended to drift south, securing 600 feet of backs.

On this property there are two ledges; the first, in which are the old works, is entirely in granite; the second, or as mentioned above the Ural, is on the contact of granite and slate, respectively. The hanging and foot walls of the ledge dip east at an angle of about 50°. This is also the Champion ledge.

The company has a fine 40-stamp mill, at present idle. A Dodd-wheel has been put in here, too, with marked success over the old Collins-wheel, making necessary only 25 inches of water instead of 60. In the mine the new fumeless powder has been successfully introduced and the miners refuse to work with any other kind, as there is a complete absence of the injurious effects of blast fumes and they find it possible to resume work almost immediately after the firing of a shot.

THE WYOMING.—This lies north and on the same vein, though at present there is a misunderstanding between the owners of the mine and other parties as to just which vein the rock now being extracted belongs and so no very reliable facts regarding developments could be obtained. The company has no mill and is storing the ore on the dump. Mr. John Buffington is superintendent.

THE NEVADA CITY.—This continues on the Ural lead to the north. The hoisting works have lately been rebuilt and the mill repaired. The mine is opened to the 1000-level.

THE SPANISH.—This is a splendid little mine persistently worked by men of limited means. It lies to the north of the foregoing mines and on a lead to the west. It has a 5-stamp mill and is developed by an incline 250 feet deep. It is owned and worked by the Lord Bros. The mine is more than paying its way and is improving with depth.

THE YELLOW DIAMOND.—This is one of the latest and most promising quartz enterprises in this section. It is 3½ miles west of Nevada City and evidences seem to show it a continuation of the Ural ledge. The present company has title to 4200 feet on the vein. Work has not yet progressed far enough to show its full capabilities. The shaft is down but 85 feet, whence a crosscut has been run on the ledge showing already a good body of fair grade ore. The plant consists of hoisting-works adapted to a depth o 500 feet. Waterpower is readily available; securing 125 feet of pressure with 250 feet of pipe. Mr. A. F. Dunnington, late of the U. S. Geological Survey is superintendent. It was while engaged in geological work that Mr. Dunnington stumbled upon this property and immediately set about forming a company for its development.

FEDERAL LOAN.—Lies on the east boundary of the Nevada City belt and four miles east of town. It also has been opened through the persistent efforts of a local corporation of limited means. It has a 5-stamp mill completed about a year ago. They are now opening up the 500-level and stoping in the others. The ore like all the rest in the district, is heavily sulphuretted. It carries besides a considerable quantity of galena and zinc blende. John Vincent is superintendent. Adjoining is the Le Compton of J. J. Ott, now flooded, but will be opened in the spring.

Consumption of Cyanide.

SAN FRANCISCO, Oct. 22, 1892.

TO THE EDITOR:—The consumption of potassium cyanide is vastly in excess of that necessitated by the dissolving of the gold and its precipitation by zinc; this discrepancy is due to several causes, thus:

1st. The decomposition of the potassium cyanide by atmospheric carbondioxide, in the absence of caustic alkali which would prevent it.

2d. The decomposition of the same by atmospheric oxygen, not entirely avoidable.

3d. The double decomposition between the potassium cyanide and base metal compounds, such as copper sulphide, iron and copper sulphates, lead sulphate, etc., preventible, except the first, by means of an alkali.

4th. The electrochemical action produced by the contact of zinc with gold, silver or iron. Zinc precipitates precious metal from the solution because it is positive to precious metal in that solution. But the solution is a solvent of precious metal, and the latter can only be prevented from redissolving by constant contact with zinc which dissolves in its place, so that it is as though the precious metal should be dissolved and precipitated many times over. Every atom of zinc which dissolves withdraws from service two molecules of potassium cyanide. The objection applies to electrolytic precipitation in so far that a continuous expenditure of energy is necessary to prevent resolution of the precious metal, whether that energy be obtained by dissolving zinc, or by other means. The difficulty may, I believe, be obviated by so arranging that the precious metal shall be absorbed by quicksilver which will, I think, protect it from further action tending to its resolution. Sodium amalgam not only meets this requirement, but also regenerates the solvent in so far as the latter is engaged in holding precious metal in solution, but sodium amalgam has the disadvantage of wasting itself in the decomposition of water.

The ideal precipitant is a salt of potassium, sodium, or calcium, which will precipitate the precious metal as an insoluble compound, regenerating the solvent solution to an equivalent extent, though the latter point is not important when gold only is in question, because the proportion of cyanogen engaged is then small. C. H. AARON.

Patent Law Amendments.

NORTHAMPTON, MASS.

TO THE EDITOR:—The postponement to the next congressional session of Senate bill No. 3246 affords opportunity for American inventors everywhere to examinine its provisions, and, if dissatisfied with any of its 11 sections, to interrogate their respective senators and representatives and endeavor to secure such modifications as they may think desirable. Section 1, especially, seems worthy of their attention. It ostensibly aims to amend clause 2 of section 4887 R. S., by which, as well known, the duration of an American patent is made dependent on that of the earliest-expiring previously granted foreign patent for the same invention; but the amendment would seem to leave the most obnoxious feature of the clause substantially unchanged. Especially vexatious is the clause to the creators of those more notable devices which, to some minds,

constitute the chief justification of the patent system. If, as commonly supposed, legislators aimed by it to give their constituents an advantage, it has signally failed nf its purpose; the recnil of the weapon has proved wnrse than the discharge. Of patent-granting countrles, our nwn is now admittedly foremost, alike in the liberality of its patent law and in the number and character nf its useful inventinns. The numher of "aliens" excluded from drawing royalties from this side is a mere bagatelle to the hnst of American inventors deprived, hy this ill-advised clause, of a revenue of many millions, which would have been drawn frnm the foreign user and circulated here; it heing notorious that a large majority of them elect to forego the dangernus foreign privilege, with the result that American inventinns have generally heen as free as air everywhere save in the country of their birth. *Wipe the clause out!*

GEO. HENRY KNIGHT.

Tuolumne and Calaveras Counties.

TO THE EDITOR:—During the past two weeks I have revisited the mines of Tuolumne and Calaveras counties. Owing to a scarcity of water there is a general dullness all along the line, but the time is being utilized in dead work and preparation for the winter.

TUOLUMNE COUNTY.

The Buchanan is quiet for the time being but will soon start up. At Sumnierville the old Eureka runs her 20 stamps right along and is now down 1100 feet. The Porto Fino is looking well, with its ores going from $35 to $45 a ton. The Carlotta is closed since Mr. Symond's acciden ial death. Oliver & Kelly have taken hold of some of the mines in this section and will soon get tu work. At Sonora the Golden Gate was hung up temporarily by an injunction but expects soon to resume business. The San Guiseppa is still in litigation. The Bonanza boys are working away but have expended about $50,000 since their last pocket. They will soon need a good ore to get even, but that is the style of the Bonanza. At Soulsbyville, the Black Oak is sinking while the Platt & Gilson is hung up seemingly for good At Quartz Mountain the App mill is running on quartz from the Dutch mine. The Dutch has been giving the owners lots of the "stuff," and a fine residence now being erected is an evidence of it. At Jim town and Tuttle town there is very little doing. Capt. Neville is crowding the Dead Horse in a way that promises to make it a very lively dead horse ere long. In a month from now the mines all along the line will be again moving.

CALAVERAS.

At Murphys, O. B. Hardy is shoving the Beatrice right along, and has his mill and tramway about completed. On Indian Creek, Cunliffe & Driver are opening up a shoot of very good rock. Just above them Geo. Hingen is driving a tunnel on his Dora mine and has a good prospect. The Washington, Calaveras and Right Bower are idle. At Sheep Ranch the Sheep Ranch mine is running steadily with the shoot lengthening out at each level, and it is now 1200 feet long, of high grade quartz. Mr. Rodaseni of El Dorado has "gone over the divide" and his mines will soon be appraised. He is supposed to have buried about $150,000, the location of which his heirs would like exceedingly well to strike. Over at the Shenandoah the mine is looking very well and will soon be given five more stamps. There is some good ground east and west of the Shenandoah that should be operated, At R. R. Flat the Keystone and French mines are working. Mr. Eoright has pulled out his mill. At West Point Mr. Rhule has got the Lone Star to shining in a way that is very satisfactory to its owners. The Riverside is soon to be started up. The Blazing Star has bought and honded all contending mines and will soon change hands and be operated largely. At Glencoe the Banner is being pumped out for inspection.

Near Mokelumne Hill the Harrold mine is putting up a Huntington mill. The old Ilex mill has been moved away to the Stickel mine at Angels. The Quaker City is in good ore and will soon he reequipped in a modern manner. The Ellencino Gravel Co. is sinking on Chili Gulch. Just ahove it a gang of Chinamen is piping in good gravel. Beyond it Messrs. Cameron and White are getting ready to work the gravel of Sprig Gulch. The old Union mine is closed as is the Shorpe. At Angels the Utica is running right along but the other mills are waiting for water. The Stickle has her 60 stamps all in place and with the Utica's 60 will soon have 120 going on Hayward & Lane's mine. As soon as water comes in the other mines will all start up. The Blair is putting up a mill and Mr. McKenzie has 16 feet of good ore on the Cherokee near Altaville. Demarest and Fullen are rapidly increasing their iron works to accomodate their fast-growing trade. The Union Ditch has had its reservoirs rehuilt and everything looks favorable for an abundance of water in the future.

E. H. SCHAEFFLE.

Is the Cyanide Process an Economical One?

REDDING, CAL., Oct. 15, 1892.

TO THE EDITOR:—In the last two numbers of the MINING AND SCIENTIFIC PRESS are two articles referring to and in part replying to some criticisms made of the MacArthur-Forrest process in a paper read before the Shasta County Miners' Association, which I may say here is an association of owners and superintendents of mines in Shasta county, at whose meetings subjects of interest to the welfare and advancement of the mining profession are freely discussed. The paper of Mr. Aaron, published in your issue of Oct. 8th, assumes that I implied that the MacArthur-Forrest patents were anticipated by the electro-gilders. I showed, as clearly as necessary, the growth of the use of cyanogen as a solvent for gold, and gave an instance where 40 years ago a solution of cyanide of potassium was used to dissolve metallic gold, not a compound of gold, as stated by Mr. Aaron to he the form of gold employed by the electro-gilders, hut a plate of metallic gold was to be suspended in the solution of cyanide of potassium and dissnlved for the purpose of plating the article to be gilded. That ought to have been plain ennugh to even a less acute critic than Mr. Aaron. The question nf interest to us as mining men is not who anticipated Simpson, Janin or MacArthur, hut has the process been demonstrated to be a really practicable method nf extracting gold from its ores. That a snlution nf cyanide of potassium will dissnlve the gold from ores, I gave instances to prnve. But will it dn sn at an expense that will leave a profit tn the mine-nwner is, it seems tn me, a question nnt so readily answered. Will Mr. Aaron kindly answer that question?

Mr. Scannell, in the issue of the MINING AND SCIENTIFIC PRESS of Oct. 15th, has given us a mnst interesting statement of the working of the prncess at the Mercur mill, for which he deserves the thanks nf every one seeking information upon the subject. Here we have, for the first time in America at least, something definite and bearing the stamp of entire candor. In making my estimate of the workings of the Mercur Co., I was guided by reports of those who had been upon the ground, as well as the report of the Denver Co. and the reports of the Salt Lake papers, which as long ago as last January stated that mill would shortly commence putting through 50 tons per day. The cost of $5.60 under the circumstances is not excessive, considering the location of the property. J. H. MORTON.

The Platinum Mines in Russia.

The platinum beds of the Ural mountains, according to the *Journal de la Chambre de Commerce de Constantinople*, are the only ones in the world where this metal is found in grains. Platinum is found in Brazil and in the Cordilleras in the hard serpentine rocks, but never in the form of grains. The platinum beds of the Ural mountains are found in various districts; in the north, at Besserski, in the Government of Perm, in the district of Khotourski, and in the State properties of Goroblagodatski, where 66 mining concessions have been granted. All the beds of the northern region are situated in the basin of the River Touri, in that of the tributary stream of Taghil, and in other tributaries higher up.

On the western declivity of the Ural mountains there is another platinum bed near the River Outka, a tributary of the Tchoussova, and the basins of the higher tributaries of the Outka, near the Ural river. The platinum found in these places is in the form of grains, in sand frequently containing gold. The weight of these grains is from 17 to 21 grammes to every 1640 kilogrammes of sand. The richness of the platinum heds varies in the same proportions. In some the thickness of the turf covering the sand does not exceed from 2.16 metres to 2.88 metres, while in others it varies from 10.80 metres to 14 metres, so that it becomes necessary to work underground. The thickness of the platinum sands does not vary much. A noticeable characteristic is that they are found in the form of friable grit, and easily washahle. The clayey sand is rarely met with.

The beds in the northern districts of the Ural mountains are most frequently of little depth, thus allowing the turf to be easily removed and the platinum is quickly reached. The platinum found in this district contains a considerable proportion of gold, whereas that found in the Taghil district contains hardly any. Moreover, the northern platinum and that of the Taghil district are very different in appearance. The former appears clear and very brilliant, while the latter is of a dull color and is frequently found mixed with rare metals, such as iridium and osmium. The size of the grains is about the same in the two beds. The demand for platinum for industrial purposes is relatively restricted, as it only dates from the last 12 or 15 years. It is largely used for electric lighting and dynamo conductors, and considerable quantities of platinum are now employed in chemical and other factories.

During the last 12 years, the annual production of platinum has averaged about 3194 kilogrammes, of which half has been derived from the beds in the north of the Ural mountains belonging either to the State or to private persons. Throughout the whole world only about 3270 kilogrammes of platinum are annually used, but it is anticipated that this amount will soon be considerably increased, and it is stated that the platinum heds of Bisserski can alone supply the total quantity required for the consumption of the world. When the demand for platinum was insignificant and the price very low, the goldminers who found platinum while seeking for gold frequently, it is stated, used the former instead of lead as shot for firing at wild birds. It is only since the demand has increased that greater attention has been paid to this metal. All the platinum extracted from the Ural mountains, after having paid a tax of three per cent in kind, is sent as raw ore to St. Petersburg for treatment and shipment to foreign markets.

IN reply to an inquiry from Santa Barbara, Mr. C. P. Huntiogton, in speaking of the railroad work between Santa Margarita and Elwood says: "Work will go on from this time forward until completion of the heavy work between San Luis Obispo and Santa Margarita, or, in other words, the work will be confined to that section for some considerahle time before any work is done elsewhere, but work will he commenced on the other portions, so that it can be finished hy the time of the completion of the heavy work." This is the first authentic assurance the people have had that work in tunneling would be entered upon this fall, or, in fact, very soon; but now there is no longer any doubt but that this branch of the work will immediately be entered upon and he prosecuted vigorously until spring, when a force, adequate to complete the balance of the road hetween the tunnels and Elwood by the time the tunnels are completed, will be set at work.

GOOD CLEANUP.—A correspondent writes us from Auburn, Placer Co., Oct. 8th, that Superintendent McCullough of the Mina Rica Gold-Mining Co. crushed, for Holcomb & Miller, 30 tons of ore from Eclipse Wedge mine. The yield was 333½ ounces, or $177 per ton. The ledge is 18 inches, heavily sulphureted and cheaply worked.

Extracting Magnetic Particles from Auriferous Ores.

Mr. Walter B. Bassett, in a paper read before the Federated Institution of Mining Engineers (Great Britain), says:

The demagnetizing of ores containing magnetite or magnetic pyrites has received considerably more attention in America than it has in England, and at the present moment there exist several methods of magnetic extraction in the former country which have attained more or less success in the treatment of granular magnetic ores. The great difficulty which lies in the way of devising a satisfactory process for treating these ores is the fact that, unless the particles are thoroughly disseminated, the magnetic grains, while attaching themselves to the magnets, are apt to inclose certain of the nonmagnetic granules with them, and to carry them into the portion of the apparatus destined fnr the magnetic grains alone. This difficulty is more acutely felt when treating magnetic pyrites or other ores possessed with only a feeble magnetic force, as the stream of magnetic particles must then be directed so close to the magnets that, unless the opposing forces are nicely balanced, there is great probability of error occurring. When the grains vary largely in size, it is preferable to screen the ores before subjecting them to a magnetizing process, as it is obvious that extremely fine grains of matter are far less susceptible to the action of any force when acting through a medium, such as air or water, than are grains of a larger size. It therefore follows that an apparatus that is perfectly capable of refining an ore, the grains of which are of fairly unform size, will fail to do so at one operation when there is a large discrepancy in the size of the articles to be treated.

Experiments have been made on zinc slimes from a mine in the Pyrenees, where some difficulty was experienced owing to the quantity of magnetite present. In this case, a successful treatment was effected by a dry process, but inasmuch as this involved drying the ores before demagnetizing them, an extra expense had hitherto been incurred. But the results of experiments have led the writer to helieve that a slightly modified machine, constructed on this principle, will be ahle to cope with the slimes as they come from the grinding-mills, without having to previously dry them. In the case of a sample of magnetic pyrites containing nickeliferous ores, the magnetic power possessed by the pyrites was so feeble that a stream of particles descending through water within one-half inch of a powerful magnet was not deflected appreciably, and in order to effect a magnetic separation the particles had to pass within one-eighth inch of the poles of the magnets. For ores of this class it is doubtful whether an economical magnetic separation can he effected, as with such limited area open to the passage of the grains, as would necessarily be the case, the plant would have to be of very large size to treat ores in quantity. The simplest problem by far is the treatment of the so-called ironsands, found in many countries extending for miles along the seashore. These sands, with the exception of portions where gravel is interspersed, have the grains of fairly uniform size, and, for the most part, with the rough edges rounded off by the action of the water. The grains of these sands, possessing a specific gravity of 5, will readily sink through water, and the separation of the magnetic from the nonmagnetic grains can he easily effected through this medium.

A great deal of dfficulty has been felt in many auriferous districts in dealing with the ores for gold extraction by processes dependent on the action of specific gravity, owing to the fact that the specific gravity of the magnetite is so high as to cause it to remain with the gold after the washing process has been performed. Many sea-beaches in New Zealand and California are composed of alternate layers of magnetite and quartz sand, and after a period of heavy gales, when the surf has subjected the sand to a continual washing, the layers of magnetite and gold are found to be almost free from quartz sand, and the line of demarcation between the light-colored sand deposited in fine weather and the black sand before mentioned is very plainly seen. It is at this time that the "beach-comber," as the alluvial goldminer of the sea-beaches is called, reaps his richest harvests. With his beach-box, which is a combination of amalgamated copper plates and riffles worked with a stream of water, he washes the sands of his claim over and over again, and rarely finds that gold is absent from them.

It is from these sands, when properly treated by a demagnetizing process, that the largest amount of gold may be obtained. Working on this principle, the magnetite once and for all will be properly separated from the gold, and unless further deposits of gold are washed up from beyond low water, as some miners believe, the whole of the sands may have all the gold contained therein extracted at a low cost and without the possibility of error. In many cases chemical processes can be substituted for the amalgamation and washing processes, but the problem as regards these may he summed up in a very few words, as follows: Will the amount of gold ohtained be from one-fourth ounce to one ounce per ton? If not, these processes may be dismissed without further thought, as the writer believes that the cost of the most modern of the cyanide or chlorination systems, with the most favorahle adjuncts, cannot he brought below £1 per ton of ore treated, while many others cost a good deal more.

With electromagnets, the cost of treatment when water-power is procurable is estimated at 1s. 6d. per ton, made up as follows: Attendant at turbines and dynamo, 1s. per hour, or 3d. per ton; attendant to feed sand to machinery hy means of a centrifugal pump, 1s. per hour, or 3d. per ton; attendant to remove the refined products, 1s per hour, or 3d. per ton; depreciation of plant, repairs, renewals, balance of trade, charges and expenses taken at 9d. per ton, making a total of 1s. 6d. per ton, a very small item when compared with the 20s per ton. of a direct chemical process, while the fact that pure magnetite is ohtained as a hye-product should not be overlooked, when it is remembered that no better ore for the manufacture of steels exists than magnetite.

Mechanical Progress.

Brushes.

When a painter buys a poor brush, he is very much like the man who takes in counterfeit money for the genuine article, either a poor judge or too careless of his own interest or too confiding in his fellow-man to look at it closely. Now, my boy, here are two propositions which I wish to impress upon your mind: First, that it is of the utmost importance to you that you buy and use the best brushes in the market; second, that nine-tenths of the brushes kept in the retail stores are not worth taking as a free gift, because, no matter how well skilled you may be, a poor, ill-shaped brush will retard your progress and in a measure spoil your work. I have no doubt but brushes are often ruined by careless and improper usage, but judging from long experience and observation, I am led to believe that more of them are spoiled in the making than by improper handling. There are two very important points to bear in mind when selecting a brush: First, is it well made? and, second, is it good material?

Here is a fine-looking brush, with long, heavy bristles. Buy it for you? No, my lad; in this case beauty is only skin deep, and the name of the maker or recommendation of the salesman is not safe to go by. Trust only to your own judgment or to the judgment of some one qualified to buy for you. Open this brush and look at the filling. What is it? Echo answers "What?" It certainly is not good honest wearing bristles. If you soak this filling in water it will no more stand alone than a wet rag. The question whether it is hair, wood-filler, Florida grass, or what not, cuts no figure, because it water-soaks and works more like a mop than like a good bristle brush. It has a good fringe of good bristles on the outside, but they fail to do their own part of the work and at the same time furnish the spring for the worthless filling; the result is, it splits and wears to a sawtooth edge. I am speaking now of whitewash and calcimine brushes. There is not enough good stock in such a hrush, ten inches wide, to make a good three-inch wall brush, and yet they are sold at prices which ought to buy a fairly good brush. If there is any one poor brush which I despise more than another, it is a shedder, which, like a sick cat, keeps on shedding the year round. It is surprising to see how many bristles such a brush can shed and seem to grow no smaller. If you find a brush has many loose bristles in it, just make up your mind that there are more to follow, and don't buy it. Don't delude yourself with the idea that you can soak it up and make it hold. Such a brush will go back on you sooner or later. One of the most desirable things about a brush is a good point. To hold a good point, a brush must have good filling. Take, for instance, a flat-chiseled brush, its chief value is a good edge or point; but as they are usually made with all the good bristles on the outside and the poor ones in the center, the poor stuff forms the point, except a little on the corners. The soft stuff in the center will wear down faster than the good stock on the outside, and the brush will soon become a stub, unfit for cutting in colors or for anything else.

A hrush of any kind should have a good cutting edge, and to do good, durable service should have good stock in the center, because, whether ground down or chiseled by wear, the center makes the point. When the point is gone the brush is a stub, and that will soon happen when a brush is filled, like this, with short, uneven, inferior bristles. Every painter should be a good judge of a brush, and exercise his judgment, and take no man's word for it. It is well to remember, my boy, that it costs you more in time to wear out a poor brush than it does to burn it up and buy a good one. If brush-makers must use short, uneven stuff in their brushes, I prefer to have it on the outside, and the good bristles in a body across the center, to give me an even and good wearing point. We are using too many poorly-filled and badly-made brushes, which are dear to us at any price. Let us kick.—V. B. Grinnell, Painting and Decorating.

CHROME STEEL TURRETS—The chrome steel turret invented a short time ago by a French naval officer is a great improvement over previous conning towers. In its design we understand that the inventor has endeavored to avoid the weak spots that render others of a similar character perfectly worthless. Instead of merely revolving or disappearing by the aid of machinery, an operation which exposes the apertures to the enemies fire, the new cupola swings, pendulum fashion, upon a horizontal axis for ten degrees. This is accomplished hy means of a counterpoise, weighing 24 tons, which is easily kept under the control of one man. Friction is reduced by a rolling motion. A cylinder under the revolving parts fits into another cylinder, of which the surface is partly concave. When it is required to fire guns, the cupola is brought around to the desired point, and after the discharge it swings back by itself, thus putting the apertures out of sight of the enemy. The whole operation of swinging only occupies five seconds, and during two seconds only are the apertures exposed to fire. The mechanism of the cupola is said to be very ingenious, but the details are, of course, kept a close secret. The French firm manufacturing this turret first supplied a number to the Belgian government, which has used them in the fortification of the Meuse. It is now executing an order for twenty-nine on account of the Roumanian government, for the defense of Bucharest, and it is stated that the French government contemplates ordering thirty.—Machinery.

Planing Surface-Plates.

Those who have had to plane up large, flat and comparatively-thin castings, as for printing-press beds, stereotyping table-tops, etc., often find great difficulty in getting them perfectly flat and straight, the reason being that when the skin is taken off one side, the tension in which the cooling of the surface cuts the entire slab is removed, and the plate is found convex on the planed side. There is but one remedy for this—to plane only a slight cut all over the side which is to be the finished one, then to turn the slab over and take a slightly deeper cut over the back; then to bring it back with the face up and work the face the second time. By such gradual approach, coupled with proper bolting down to the planer bed, the largest plates may be made as perfectly level as is demanded. They should be tried, after planing, with a slightly bellying file, held in a special holder, and then given final finish as to surface by the scraper. In such work good surface plates should be used, and these should be tested with each other and standard, which latter should never be used except for purposes of comparison.

In this connection, attention should he called to the habit that some careless workmen have of putting surface plates, while in use, where they will get warmed up on one side or on one not more than on the other, so that they will be sprung by the heat of the sun or of the steam pipes. The more accurate a surface plate is, the more care should be taken to keep it at uniform temperature all over and, as far as possible, to have that temperature the same as that of the material which is compared with it. If a surface plate which has been lying in the sun and attained a temperature of 90° Is laid on a printing-press bed, which, by reason of being in a dark part of the shop in a draught, has only a temperature of 70°, or even 60°, the slab will cool the working-face of the surface plate and spring it out of true plane, despite its thickness or its ribs. In fact, sometimes the thicker it is, the more readily it may be sprung.

If the surface-plate has an even temperature all over, it will remain true unless laid on something hotter or colder. If it has lain in the sun face up, its face will get convex; if it has lain back up, it will get concave on the face. As most surface-plates are longer than they are wide, and tend to spring into a cylindrical rather than a spherical surface, the effect of curling by reason of unequal heating may be discovered, and to some extent neutralized in work by using them in two directions—once with their length parallel with the length of the piece being tested and again with length at right angles thereto.—Artisan.

THE GREAT CHICAGO CHIMNEY.—One of the most notable achievements in the rapidly-multiplying applications of steel to structural purposes is a new chimney of that material in Chicago, which is 350 feet in height, with an outside diameter of 9 feet 5 inches. The steel varies in thickness from 5.32 inches at the top to three-eighths of an inch at the bottom. The lower 75 feet of the chimney is lined with firebrick 8 inches deep, formed to fit the shell compactly all around, and above this it is lined with hollow tile. This lining is supported at intervals of 25 feet by an angle-iron riveted to the steel-shell; that is, the chimney is lined in a manner similar to blast-furnaces and foundry-cupolas. The steel-shell is carefully protected from corrosion by painting inside and out. The weight of the chimney is spread to the foundations in the same manner as that of the columns of the building, the foundation on which it rests consisting of first layer of cement, then two layers of steel-rails in cement and one layer of I-beams, on which the cast-iron shoe, which takes the shell of the stack, rests. The capacity of the chimney is 12 60-inch boilers, 20 feet in length. The outside diameter of this chimney is 9 feet 5 inches, while were it constructed of brick it would he 16 feet 6 inches at the hottom.

Scientific Progress.

Magnetic Field.

An air-space filled with lines of magnetic force is called a magnetic field. A magnetic field cannot exist without an inducing magnet or current of electricity. The space surrounding and in front of the poles forms the field. As is well known, lines of attraction radiate from every part of the pole. These are most numerous in front of the pole, although they spread out in all directions. That part of the field in which the lines are most numerous attracts a piece of iron most strongly, and is said to be the most intense part. The greater the number of lines of force in a given space the stronger or more intense the field. If the magnet be bent, so as to bring its poles close together, the lines of force can be shown to have become concentrated. They are no longer diffused and scattered. Their area is restricted, and the field is said to be intensified because the lines are crowded together. Hence the strongest field is that in which there is the greatest numher of magnetic lines per square centimetre or square inch, as the case may be.

The magnet setting up the field may consist of a bar or a horseshoe of hard steel. This is the only substance yet found capable of retaining a considerable proportion of the magnetism conferred upon iis molecules. Or the magnet may consist of a bar or a horseshoe of soft iron, around which an electric current is caused to circulate. The former type is called a "permanent" magnet, because it retains the polarized condition, although no magnet is truly permanent. The latter case represents an electro-magnet—a coil of insulated wire surrounding a soft iron core—but its polarized or magnetic condition rapidly decreases after the stoppage of the current.

An interresting fact has recently been brought to light with reference to steel, that an admixture of as small a proportion of manganese as 12 per cent will render steel almost indifferent to magnetism; it cannot be magnetized or attracted by a magnet.—Electrical Age.

Brass by Compression.

In a recent meeting of the Amsterdam Royal Academy of Science, Mr. Behrens dealt with specimens of brass made by compression of the constituents, at ordinary temperature, by Prof. W. Spring, Liege, Belgium. One of the specimens was of a reddish color, and had been produced by compressing a mixture of copper and one of zinc; another, pale yellow, by compressing seven parts of copper and three parts of zinc. Both specimens had been filled up twice and again consolidated by pressure. The reddish metal was a little softer than common cast brass; it could be somewhat flattened under the hammer. The yellow metal was harder than common brass and brittle. Both varieties contain a great quantity of yellow alloy, which seems to be in an amorphous state, showing a uniform, finely granular appearance, without any vestige of the beautiful crystallites, so characteristic of copper-zinc alloys obtained by fusion. Further, there were a good many angular fragments of red copper, some of them cracked and doubled up, with yellow threads between the red lumps and strands, and finally some zinc, angular fragments and threads, trending outward, and uniting near the curved surface of the cylindrical specimens. The metal is nearly, but not wholly, compact. There is much that gives evidence of a flow in the yellow alloy and in the zinc, hut nothing pointing to a truly liquid state of the alloy or one of its components. Relegation seems to be put aside, while there does not remain any doubt that zinc and copper have been intimately mixed and actually united by repeated fillings and compression. Scientists say that a more complete union of metallic powers by compression will lead to alloys of most remarkable properties, and may give some alloys that cannot be produced by fusion.

ABOUT LANTERN LIMES.—It is not generally known, says the *Optician*, that porcelain (such as an unglazed combustion tube) becomes *saturated* with hard carbon on exposure, while at the temperature of incandescence, to a hydrocarbon gas. Other porous and refractory substances can be similarly carbonized. The electric resistance, however, remains extremely high in most cases, a fact impressed on us by some experiments that were tried about 10 years ago with the object of applying such carbonized materials in electric lighting. The carbon thus deposited interstitially is, of course, strongly resistive to oxidation, but it would tend, presumably, to strengthen and bind together any very porous and friahle substructure. The suggestion has recently been made that such a carbonizing process might be applied with advantage to the cylinders of limes used in oxyhydrogen lamps. Certainly, if the durahility of the cylinders can thus be increased without detriment in other respects, a very important point will have been gained. The high electrical resistance that we have remarked is favorable, inasmuch as it implies but a trifling increase in the conductivity for heat of the carbonized material. From this point of view, the carbonized limes would be distinctly superior to arc-lamp carbons, which have also heen proposed for the same application.

Big Ammonite Blast.

A good deal of interest was taken at Newport (Monmouthshire), on September 9th, in the trial of the new explosive ammonite. The test was made in blowing down a heavy stone-wall, of 920 cubic yards capacity, dividing the Alexandra dock from an extension dock which had just been completed. The wall, which has been standing for about 20 years, weighed nearly 2000 tons. A wall containing 8500 tons, standing in a somewhat similar position, was in 1886 destroyed at the Galleons wharf, Victoria docks, London, with blasting gelatine, of which explosive 2900 pounds were employed, or in the proportion of about one pound of explosive to three tons of masonry, while in this case only one pound of the new explosive employed was used to each 20 tons. Water had been let into the new dock from the river Usk and a level made with the water in the older dock. In order to remove the wall dividing the two, it was decided to try the explosive force of ammonite fused by electricity. Charges of a hundred pounds of the compound were placed in 43 drilled holes, under the direction of Mr. Wilcox, the explosives company's works manager, and Mr. Butterfield, the chemist, and a dynamo of 110 volts was connected with the charges. Lord Tredegar, as chairman of the dock company, worked the electric switch, and the explosion which followed was considered highly satisfactory. It was not intended to demolish the wall entirely, but to so split and crack it that the masonry could easily he dislodged and removed. That result was practically attained, the wall being loosened all through from top to bottom without any damage being done to the surrounding works at the dock. Ammonite is one of the Sprengel class of explosives. It consists of ammonium nitrate and nitronaphthalene, mixed together in an edge-runner rill at a certain temperature and afterward filled into metallic cases. One of its chief advantages is that for many purposes it is perfectly harmless, and cannot be fired by ordinary concussion or even by throwing it into an open fire. Its explosive properties are only brought out in the case of a detonator containing fulminate of mercury. It is coming into extensive use in collieries where, by carefuly tamping with clay, it is possible by electric-firing to prevent the appearance of any flames, which is a distinct advantage in mines where gas is present in large quantities.—Iron (London).

A NEW METHOD OF REMOVING SCALE.—At a recent meeting of the Scientific Association of Saxony, one of the members recommended a new way of removing scale from boilers. He uses liquid carbonic acid, with which he fills a tank connected with the boiler, which is filled with cold water. The water is soon saturated with carbonic acid, and this carbonic acid water dissolves the carbonate of lime, the principal component of boiler scale, forming acid carbonate of lime. The gypsum combined with it is precipitated, and on the water being drawn off the boiler is found to be free from scale.

A VERY simple method for fastening leather to iron is to paint the iron with some kind of lead color, say white-lead with lamp-black. Leave it to dry, then cover it with cement made as follows: Take some of the best glue, soak in cold water till soft, then dissolve it in vinegar, with a moderate heat. Add one-third of its bulk of white turpentine; mix thoroughly. It should be of the proper consistency to spread with a brush. Apply it hot, place the leather on quickly and press it tightly in place.—Manufacturers' Gazette.

NEW DISCOVERY.

Mines Revived and Miners Enriched

By the wonderful **MacArthur-Forrest Process**, Controlled by The Gold and Silver Extraction Mining and Milling Co. H. A. W. TABOR, Pres.; LEONARD GOW, V. Pres.; H. A. JONES, 2d V. Pres.; P. GEO. GOW, Technical M'g'r. and Ass't Treas.; T. L. WISWALL, Gen'l M'g'r. and Sec'y; PETER MCCOURT, Treas.; W. L. COOPER, Eng.

DENVER WORKS: On the D. & R. G. R. R., near the Broadway Electric R. R. Depot.

GLASGOW WORKS: The Cassel Gold Extraction Co., Limited, Scotland Also in Australia, South Africa, New Zealand, Queensland, Etc.

General Office of Company:

Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: Denver; The Livingstone Gold Mining Co., Boulder Co, Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co, Cal: The Shasta Gold Ex Co., Middle Creek, Shasta Co., Cal.; The Mercur Gold Mining Co., Fairfield, Utah; The Pacific Gold and Silver Extraction Co., Gro Grande, San Bernardino Co., Cal.; The Ora Bella Mining Co., Yavapai Co., Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenua Con. Gold Mining Co., Ravenue via Norris, Mont; and others in course of erection.

The object of this company is to introduce the Mac Arthur-Forrest process.

We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.

If you desire an experimental test communicate with the secretary.

If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons in Denver.

We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.

The process consists of pulverizing the ores to a fineness of about 50-mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tubs especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.

The total cost, as as rule, does do exceed from $2.50 to $5 00 per ton.

The most desirable class of ores for this process are the so-called refractory gold, ores pyrites, hematites, manganese and tellurium. We have also treated successfully dry silver ores.

We will be pleased to answer any inquiries and furnish any desired information. Address,

T. L. WISWALL,

P. O. Box 926. Gen. Mgr. and Secretary.

QUARTZ SCREENS

A specialty. Round, slot or hurred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

The Best Mining District

On the Pacific Coast!

GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is

THE TIDINGS,

Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.

Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.

DAILY, $6.00 a year; WEEKLY, $2.50, *in advance.*

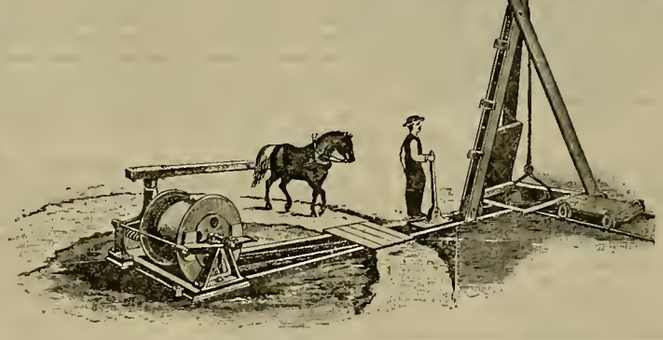
BUILDERS OF

"Sensible" Horse-Power Hoisting Whims.

(DAVIS PATENT.)



PRICES REDUCED.

The "Sensible" Hoist is the cheapest and beyond doubt the best in the market. It is built entirely of iron and steel, mounted on a heavy iron base plate, and is therefore very durable and not affected by exposure to climatic influences.

The bevel gear on the drum shaft is loose, and, in hoisting, drives the drum through a friction clutch. This avoids the frequent accidents occurring with other Whims, occasioned by the breaking of the gear teeth when throwing them out of gear. In lowering, the drum is pressed by a powerful screw lever against brake woods at the opposite end. Perfect means of adjustment are provided for the friction clutch and brake blocks.

As the drum is entirely independent from the driving gears the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases the capacity of the machine by avoiding the loss of time due to stopping and starting the horse.

It is very light and compact and very easily taken to pieces for transportation by mules. The cost of erection is very small, two men in half a day being able to put it in place ready for work.

Weight of hoist, 1200 lbs. Total shipping weight, including sweep, levers and sheaves, 1400 lbs.

Circulars giving Capacities and Prices furnished on application.

BALDWIN LOCOMOTIVE WORKS.

ANNUAL CAPACITY 1000. ESTABLISHED 1831.

LOCOMOTIVE ENGINES!

Adapted to every variety of service, and built accurately to standard gauge and templates. Like parts of different engines of same class perfectly interchangeable.

Broad and Narrow Gauge Locomotives, Mine Locomotives by Steam or Compressed Air, Plantation Locomotives, Noiseless Motors for Street Railways, Furnace Locomotives, etc.

COMPOUND LOCOMOTIVES

BURNHAM, WILLIAMS & CO., Proprietors, Philadelphia, Pa.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies the information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not few. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, San Francisco.

RUPTURE, PILES and all Rectal Diseases POSITIVELY CURED, in from 30 to 60 days, WITHOUT OPERATION OR DETENTION FROM BUSINESS. Also ALL NERVOUS, SKIN, BLOOD PRIVATE AND CHRONIC DISEASES OF BOTH SEXES. STRICTURE AND URINARY TROUBLES CURED. No charge unless cure is effected. Consultation free. Call or address for pamphlet, DRS. PORTERFIELD & LOSEY, 838 Market Stree San Francisco, Cal.

Electricity.

Storage System Bound to Come.

A correspondent of the *Electrical Engineer* says: Advocates of both the overhead and uoderground systems are in the habit of stating that there is no prospect whatever of a successful storage battery system, or, at least, so remote is the prospect that it is unworthy of present attention. The statement is very freely made that every attempt so far has proved an unmitigated failure. There is undoubtedly a great deal of truth in this statement; but not so in the statement of there being little or no prospect of future success. Those who have given special study to this industry and have a practical experience in the actual working, together with a thorough technical knowledge of the requirements and capabilities of storage-batteries of various types, do not agree with the pessimists of the electric-storage systems as applied to street cars. There are, moreover, at the present time some very mistaken ideas among the public in general as regards the true state of the art, and also as regards the direction from which ultimate success may he first expected.

Now the public should be apprised of the fact that there is no question whatever at the present time, and has been no question whatever for years, but what storage-battery cars can run as smoothly, he as easily handled, attain the same speed, mount equal grades, stop, reverse, and in fact do all and everything equally well, and sometimes better than any other electrical system either overhead or underground. A great deal is made out of the fact of the great extra weight. It is upon the strength of an enormous reduction of this said weight that inventors and advocates of the numerous so-cal'ed "entirely new and improved storage systems" attract their patrons. In some cases a certain reduction of weight may be made, hut it is usually at the sacrifice of stability and strength. As a matter of fact the subject of reduction of weight is not nearly so important as the public is led to suppose. A reduction of 50 per cent of battery weight would, on an average, mean a saving of 10 per cent of total weight upon a car capable of seating from 30 to 40 passengers.

Thus with the facts before us that a storage-battery car can do all and everything as well and perhaps better than any other electric car and that the weight is an overrated objection, it may be justly asked, why have they not been successful? The answer to this is very simple. Because hitherto the cost of operating—in consequence of the depreciation of the batteries themselves—has been too high. The cost of prime motive pnwer is less with storage-batteries than without. Now, the only way of proving the success of any storage-car system is, in the first place, for the owners to make a contract with some good representative streetcar company, by which said owners undertake to operate and maintain their batteries in proper working order upon a fair number of cars at a fixed price per car mile.

If such a contract is taken at a price satisfactory to the car company, this is the first step toward the required proof. If at the end of the first term the contractors are ready to renew said contract on same or equally satisfactory terms, having by their previous operation given sufficient satisfaction to the car company to warrant such a renewal, then we come to the second and very important step toward the final proof. The last and most important step is for the contractors to prove that they are operating on a profitable hasis. This can be shown by their books or their willingness to take further contracts upon the same terms.

Numerous contracts of the above nature have been made and started upon. Some have resulted, so far as they went, in the satisfaction of only one party to the contract, usually the car company. In others, again, there has been general dissatisfaction all around. In all cases, however, difficulties and disagreements have arisen at the second or third stage of the drama, namely the renewal and extension of contracts. Numerous excuses have been made, the principal of which is lack of funds. For ample funds there must be ample faith. It is the lack of faith that has produced the lack of funds. All these contracts, however, no matter how short a time they may have lasted, have resulted in some good, namely, the acquiring of practical experience as to the requirements in actual working. Each so-called experiment has been one step ahead. It is from those who have been thus steadily working ahead in this field that the long-wished-for result must he looked for.

Those who have devoted many years of study and close attention to this special subject, as a rule do not expect to see the sudden solution of the problem arise from some great and unexpected discovery. Of course it must not be denied there is a possibility of something new and unexpected suddenly coming to the front; but the possibilities of such appear greatest to those who have the least knowledge and experience in this branch of science. Most scientists will probably agree that it is to the developments and imprnvements which have resulted from continued study and experience of present systems that we must look for the solution of the problem.

As a last question which a patient public may justly ask: How soon may this long-looked-for and long-wished-for result be expected? It may be stated in reply that in all probability even the next few months may show some decidedly encouraging advances. Contracts such as described above have been entered into hy experienced and substantial firms. The contracts are now entering upon the second stage—namely, that of renewal and extensions. These are heing watched with the utmost interest, as apparently at no previous occasion have the contractors been in a more substantial position and with a hetter knowledge of their subject than at the present time. Results so far give every promise in the very near future of a practical proof beyond all question that the storage system is bound to be the system by which the problem of rapid transit is to be solved.

Electrolysis and Lead Water Pipes.

In a recent number of the *Electrical World* attention was called to what was supposed to be a case of damage to lead water-pipes by the electrolytic action of a street-railway current. This case was in the city of Saginaw, Mich., where a lead pipe ran for some distance parallel to the electric railway. On taking up the pipe, it was found to be seriously corroded at numerous points, its appearance being similar to that of a worn-out storage-battery plate. Since the presentation of this case in our columns, our attention has been called to a very similar occurrence in the city of Athens, Greece. Mr. Etienne de Fodor, the manager of the Athens central station, informs the *World* that the neutral wire of one of their circuits was grounded by connecting to a lead pipe nearly a mile in length and two inches in diameter. Trouble was experienced by the failure of one of the lead-covered cables, which showed a series of small pinholes apparently resulting from the gradual disintegration of the lead-sheathing. This failure occurred upon both the positive and negative mains of the three-wire system. It was soon discovered that the water-pipe to which the neutral was grounded was leaky, and an examination showed that the entire pipe was filled with a series of small holes similar to those found in the sheathing of the lead-covered cables. At several points the water-pipe was in contact with flowing water, and at these points it was found to be uninjured; but wherever it touched damp masonry, and was not in contact with running water, the perforations mentioned above were found, the metal at these points being badly oxidized and crumbling at the mere touch.

Chemical disintegration was especially noticeable at the soldered joints of the water-pipe. Investigation showed that other lead pipes placed in the same channel, hut not connected to the return circuit of the electrical conductors, exhibited no trace of injury; and this, together with the fact that the pipe was badly damaged at the point to which the conductors had heen soldered, was taken to indicate that the disintegration of the metal had been caused hy the electrical current. Another point which seemed to strengthen this view was the fact that wherever the pipe was surrounded hy flowing water, scarcely any damage could he detected, and this was attrihuted to the presence of a small amount of oxygen in the flowing water. The result of this experience in the Athens central station has been to lead the company to helieve that the grounding of the neutral wire in three-wire systems is not to be recommended. The managers helieve that an entire system constructed in this way would tend to increase the danger from short circuits rather than decrease it. If any of our readers have had similar experiences of this kind, we should he glad to have them brought to our attention. So far as we are aware, the case noted at Saginaw, Mich., and this one at Athens are the only experiences of this kind that have ever received puhlic attention.

TRAIN-LIGHTING BY ELECTRICITY. — The successful working of the electrically-lit train on the London, Brighton & South Coast railway seems to prove that electricity can readily he adapted for service in this direction with advantage. The axle of the guard's van drives by means of a belt a small dynamo placed in the guard's van which charges accumulators. From these accumulators wires run to all parts of the train, and a light is maintained in a fairly constant manner. The speed of the dynamo varies considerably according to the rate at which the train is traveling, hut by an automatic arrangement the machine hegins charging when the train is going at about four miles an hour and cuts out when below this speed. In case of an accident to the train, the wires would be simply broken, and all danger of fire at an end. It is stated that to light an ordinary train by electricity an expenditure of about two-horse power extra is required from the engine. Dynamos to give a constant voltage with large variations of speed are well understood, and it is this knowledge which makes the utilization of power of variable nature at the present time quite possible. Thus windpower, which in this country is so very unreliable, may be now employed, which a few years ago would be out of the question. The fact is, the dynamo is so well worked-out that machines can be supplied to suit all possible requirements. Thus to the ordinary types of series, shunt and compound machines, must be added dynamos to give a constant voltage or constant current with varying speeds. A windmill can thus drive a dynamo within the wide range of 500 to 1500 revolutions, and still keep the pressure sufficiently constant to charge accumulators, although, of course, at widely different rates. The dynamo may now be considered the most perfect generator of power, and it has practically grown to its present advanced position in less than 20 years.—Machinery (London).

Improvements in Electric-Traction.

At the annual meeting of the Street Railway Association of the State of New York, an interesting report was made by the committee on "Recent Improvements in Electric Traction," which is published in full in the *Electrical Age*. From this we make the following extracts:

Electric systems as first constructed were built on altogether too light a plan, and the increasing tendency year by year has been, and is, for heavier and more solid construction in every department, but particularly in the way of track and station equipments. It has been well said that no new departure is ever perfect at the beginning, and no one realizes this more than he who has watched the development of electric traction during the last few years.

The storage-battery has made but little progress duriog the past year, and is not likely to cut much of a figure in electric traction until it is able to make a better showing, financially, than it has in the past.

The general tendency of the times to consolidate all common interests under one management is showing its effects in electric traction more now than ever, and scarcely a week passes that we do not hear of some syndicate obtaining control of some horse-road, and the information usually ends with the statement that "it is intended to equip all the lines with electricity." From many points of view this is an improvement, and a marked one.

Probahly the greatest advance in any particular line has heen in the matter of armatures for motors and dynamos. The "iron-clad" type will do more toward reducing the hill for repairs in that direction than any other one thing that has been introduced during the year. The electric companies have adopted this form as their standard.

In the manner of controlling the motors, most of the companies still use the time-honored rheostat, although one company is endeavoring to introduce a new type of controller.

Many roads, acting under a misapprehension of the requirements, started off with motors too small for the work, and endless trouble has heen the result.

There has heen a general improvement in all parts of the overhead material. We are using stiffer poles, stronger span wires, better trolley-wire insulators and more handsome curve-fittings, so that the general appearance of the system is much pleasanter. The quality of insulation now in general use is far superior to what we had two years ago, and as double iosulation is now employed on the span wires, very little trouhle from leakage is experienced.

The power station may be rightly called the heart of any electric system. The trolley and feeder-wires form the arteries, the rails and return-wires the veins, and the cars the capillaries connecting them. The hihlical injunction to "Guard thy heart with all diligence, for out of it are the issues of life," would certainly seem applicable to the station. The chief element to be considered should be reliability, and after that, economy. Just what means shall be used to attain this end seems so far to have been a disputed matter, as shown by the stations now in operation, which contain almost every conceivable device—good, bad and indifferent, all shapes, sizes and descriptions of engines, boilers and dynamos. Many designers of stations—if some of them can be said to have been designed at all—seem to have gone at their task utterly regardless of the future and oblivious to the experiences of the past. However, through it all, a very marked improvement is observable lately. The designers of stations are learning wisdom from their past experiences, and the makers of apparatus are more alive to the requirements of the system, and better material and workmanship can be had where required.

The recent introduction of large multipolar dynamos has brought about a change in station arrangements not heretofore obtainable, and in all large stations now being built, countershafting is dispensed with entirely, and the general tendency is toward reduction of parts, which in turn means simplicity. It is very probable that we have reached now a form of station that will be fairly permanent, and the main point in the future will be the size of the units. For medium-size stations, engines with releasing-valve gear belted direct to a multipolar dynamo will be the best where the price of land is not excessive, and direct-coupled engines and dynamos for larger stations. There have been no comparative tests made as to the economy of the various types of stations, although all reasoning would point to these latest types as heing by far the most economical.

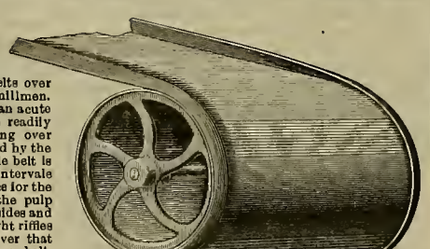
F. A. HUNTINGTON,
BEST QUARTZ MILL.
BEST ORE FEEDER.

GEO. E. WOODBURY,
BEST CONCENTRATOR FOR ORES OF ALL KINDS.

THE BLASDEL CONCENTRATING BELT COMPANY.
We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.
First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flangee when desired.


H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

RAND DRILL COMPANY,

ROCK DRILLING, AIR COMPRESSING, MINING AND QUARRYING
MACHINERY,

GAS WORK A SPECIALTY.

Testing and Working Silver Ores

A VALUABLE BOOK.

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Kroehnke's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, $2.00. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

ENGRAVING—SUPERIOR WOOD AND Metal Engraving, Electrotyping and Stereotyping done at the office of this paper.

Useful Information.

How Shellac is Made.

What makes your derby stiff? Shellac. What is sealing-wax? Shellac principally. What is shellac? It is the prodnct of a composite mass that is fouod on the young twigs and brancbes of the hutea, croton and other trees that grow in the countries of the East. Shellac is coosumed in great quantities all over the world in commerce and in arts. It is kept in the shops and large warehouses in large hogsheads. It varies in color and thinness and is transparent. It comes in broken pieces of irregular sizes, some of it beiog very thin.

The crude mass from which shellac is obtained is produced by a small insect (Cocars lacca) resembliog somewhat the cochineal. The insect is hatched, matures and dies on these twigs. A number of female insects, with a few males, fasteo themselves upon the tender twig and puncture the hark. A tenacious fluid exudes and envelops them. The insects feed upon the juice, derive their nourishment from it and deposit their eggs within it. The males only have wings, and as soon as the females begin to die a few females and the males go to other trees. After the females that remain io this gelatinous mass have deposited their eggs aod have died, the eggs hatch out the young insects. The young burrow through the dead bodies of their mothers to the surface of the mass and then cover the neighboring branches. The eggs are deposited close to the bark, so that they are protected by their mother's bodies and by the mass that has exuded and enveloped the female iosects. Finally the young twigs are completely covered with a tbick, bard, resinous substance. When the females die the frames of their bodies form little cells like those of a honeycomb. As a result of decomposition there are the elements of a beautiful purple dye.

When these twigs have been sufficiently loaded with the resinous mass, tbe natives of the countries in which these trees grow, strip the trees of these twigs and break them into small sticks. These pieces are called sticklac. These broken twigs are immersed in hot water and the hot, resinous substance is kneaded by the haods to press out the purple dyestuff. After the gelatinous mass has become sufficiently soft it is taken out and dried. It is then put into coarse cloth bags and suspended close to the charcoal fires. Presently the mass hegins to melt. By twisting tbe bags the mass is squeezed out, dropping onto flat sticks placed for that purpose. As it is dropping from the bags it hardly strikes the sticks hefore it is cooled by tbe air. It forms into thin cakes as it is deposited on these sticks or narrow, flat boards and dries. These cakes or sheets are called shellac. As the melted mass is dropping from the cloth bags, small drops unavoidably fall to the ground and dry in litttle, round bodies called cottonlac. Other and larger pieces that also fall to the ground and dry are called platelac.—Boston Globe.

Finishing Oak.

The most fashionable method of finishing woodwork in the natural color of wood, according to A. P. Daire, is to use what is known as "quartered oak" for the panels. This is oak cut in a certain way so as to show the grain in the most variegated and attractive manner. This is then finished in either the antique or natural method. The finish of what is known as "antique oak" is produced in the following manoer: The job should be made of hard wood, witb as full ao open grain as possible to secure a fine effect. Sandpaper this and cleao off. Then prepare a priming made of 1 part japan, 1 part raw linseed oil and 1 part rubbiog varnish. Drop into ½-gallon of the liquid 1 pound of commercial cornstarch, such as is used for culinary purposes. Next take some good, dry, burnt Turkish umber, and add about ¼-pouod of this to the starch. Apply to the job a good flowing coat of this priming. Let stand until it is set and has soaked well ioto the grain, and then take a broad putty knife and slick it into the grain, working the knife crosswise of the grain. Again let stand a little while, and then wipe with rags; especially, clean out all the corners and get the job into as good condition as possible as regards having the grain well-filled.

Upon the completion of the operation above-described, it will be found that the open grain has absorhed tbe starch and umber, and that these portions now show the dark shade suggestive of age, while all the rest of the surface is also slightly darkeoed.

When again perfectly dry, give one coat of rubbing varnish, prepared hy adding to it ½-pound of starch to each gallon of varnish. This coat should be flowed on freely as a medium coat of rubbiog varnish, but he careful not to have runs or sags. This ought to completely fill the wood, after which proceed to varnish, rub and fioish the joh io the usual manner. To produce a natural oak finish, follow precisely the same course as above-described, with the single exception of omitting the umber. This will leave the wood in its natural color.

Polishing Wood with Charcoal.

A method of polishing wood with charcoal, now much employed hy Freoch cabinetmakers, is described in a Parisian technical journal. In this cosmopoliton city may be seen many articles of furniture of a beautiful dead-black color, with sharp, clean-cut edges and smooth surfaces, the wood of which appears to have the density of ebony. As against furniture reodered black by paint or varnish, the difference is so sensihle that the great margin of price value between the two kinds of work explains itself. The operatioos are much longer and more minute io the case of charcoal-polishing, which respects every detail of carving, while paint and varnish would clog up the holes and widen the ridges. In the first process, only carefully selected woods are employed, of a close and compact grain; they are covered with a coat of camphor dissolved in water, and afterward with another, composed chiefly of sulphate of iron and nutgall. These two compositions, in blending, penetrate tbe wood giving it an iodelible tinge, aod at the same time rendering it impervious to the attack of iosects. When sufficiently dry the surface of the wood is rubbed at first with a hard brush of couch grass and then with charcoal of substances as light and pliable as possible. Aoy hard grains remaining in the charcoal scratches the surface iostead of rendering it perfectly smooth. The flat parts are then rubbed with natural stick charcoal, and the indented portions and crevices with charcoal powder. Alternately with the charcoal, tbe workman also rubs the furniture with flannel, soaked io lioseed oil, and essence of turpentine. Repeated pouncings cause the charcoal, powder and oil to penetrate into the wood, giving the furniture a beautiful color and also a perfect polish without any of the flaws of ordinary varnish.

THE CARE OF THE EYES.—Not long ago an advertisement was read in which an optician promised to examine the eyes of all who came to him *free of charge*, and to provide glasses for the same at moderate rates. The object of this free examination was evidently to provide customers for the sale of the glasses and spectacles. The advertiser may have been a skilled oculist, and perfectly able to provide for the needs of his patients, but is it worth while to make the experiment? Any ooe who has ever been threatened with blindoess will protest against running any risk in the treatment of tbe eyes. Sight is the most blessed of all of the five physical senses. Blindoess, or the thought of blindness, seems like a living death, and only tbose wbo have experienced the fear can understand it. Do not take any risks with your sight. Do not experiment or allow others to experiment with your eyes if they are weak or failing. Economy of money at the risk of losing your eyesight is foolishness. The eye is one of the most delicate of organs, and easily ruined and the sight destroyed. There is no excuse for negligence in the matter; there is no use to try home or cheap remedies. If your sight is failing, if your eyes are out of order, hesitate not for a moment, but consult a competent oculist at once, and seek oone but the best. Sight is too valuable and precious to be trifled with. Those who have suffered will tell you the misery eotailed. There are hospitals where the eyes are treated free in many cities by the best oculists, so it is not a question of money. And the warning cannot be repeated too often—do not trifle with your eyesigbt under any consideration.—Harper's Bazar.

NEW METHOD OF TIN-MINING IN THE MALAY PENINSULA.—Mr. Leech, an official in Perak, in a receot report described a new method of tio-mining which is being adopted in that State. He says that the system of mining in Kinta during the last year has completely changed, owing to the introduction into general use of short wash-boxes, called by the natives "lanchut kechil." Up to the end of 1890 they were hardly known; now they are used everywhere. The wash-box employed formerly was 30 feet long and could only he used with a considerable head of water; a 6-inch steampump could only keep two boxes going, and, as a natural consequeoce, only land in the neighborhood of large streams of water, or in which the owners could afford steam or waterpower pumps, could be worked. Considerable capital was therefore necessary to open a mine, and the only part of the land worth washing was the karang, or rich tin deposit, found at a depth of from 10 feet to 50 feet below the surface. The introduction of the lanchut kechil has changed all this. The box itself is but 8 feet long, and costs about 17s. It can be put up wherever there is a pool of water; instead of requiring a steam-pump, it can be supplied with water by one man ladling with a kerosene tin, and, instead of large sums being spent on strippiog the surface-soil before the karang could be reached, the surface-soil itself is now washed in the lanchut kechil, the same water being used over and over again.

THE PRICE OF PLATINUM.—It is reported that the recent scare as to the scarcity of platinum was got up for a purpose, and that the increase in price was due to a combination between the English handlers of the ore and a hroker in St. Petersburg, who together controlled the production aod got up a "corner" in this article. The increase in price has, however, provoked competitioo, and several new mines have now been opened, whicb bave increased the production considerably. There are now at least 40 mines at work along one river, but the plant employed is of a very primitive character. Some of the mineowners have now introduced steampower, but at present the sand is not purified at the works, but sent to an establishment in Germany where it is prepared for the market. The yield of crude platinum for the year 1891 from the Ural provinces exceeds 9000 pounds, or 50 per cent more than the returns for tbe previous year.—American Manufacturer.

IT has been discovered that the first patent granted to an inventor in America, was to an Englishman named Joseph Jenks. An act was, it appears, passed in the year 1646 by the General Court of Massachusetts Bay according to this person "the exclusive right of making and selling his improved scythe for the term of fourteen years." The decree was, therefore, promulgated exactly 26 years after the "Mayflower" had landed its burden at Plymouth, in the State which was afterward destined to witness the commencement of the American War of Independence. The improvement protected by Mr. Jeoks' letters-patent is stated to bave consisted in changing the short, thick, straight English scythe into the longer, thinner, curved instrument with stiffened back.

GUNPOWDER is a force that acts so quickly that it may be taken for a blow from a sledge-hammer. A fly-wbeel was to bave been removed from the end of a shaft, and, to make the work as light as possible, another wheel from the waste pile was placed alongside of it on the shaft, and a seam charge of powder exploded between these hubs. It is now thought that if a strain could have brought upon tbe rim of the wheel by ropes extendiog in the direction of the shaft, this wheel might have been available for further use. As it was, the hub moved too far for the spokes to spriog such a distance without baving some assistance from the rim of the wheel.—Boston Journal of Commerce.

IMPROVED CENTRIFUGAL PUMP.

SAN FRANCISCO

TOOL COMPANY

HEADQUARTERS FOR

Machinery and Information for Irrigating Plants of All Sizes.

ESTIMATES CHEERFULLY FURNISHED.

Address Works, First & Stevenson Sts, SAN FRANCISCO, CAL.

Send for book showing cheap irrigation, mailed free.

FRANCIS SMITH & CO.,

MANUFACTURERS OF

SHEET IRON & STEEL PIPE

FOR TOWN WATER WORKS.

Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.

NO. 130 BEALE STREET, SAN FRANCISCO, CAL.

Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.

SEND FOR PRICE LIST.

The Judson Dynamite and Powder Co.,

—MANUFACTURERS OF—

Dynamite and Blasting Powder,

18 CALIFORNIA STREET, SAN FRANCISCO.

Directors:

EGBERT JUDSON, ALVINZA HAYWARD, THOMAS BELL, JOHN S. DOE, ED. G. LUKENS (President)

A. T. DEWEY. W. B. EWER. G. H. STRONG.

DEWEY & CO.'S

Scientific Press Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St, S. F.

G. & E. PENNINGTON & SONS,

STEEL WORKS.

MANUFACTURERS OF

Best Refined Cast Tool Steel, Machinery and Hammer Steel,

Steel Piston Rods, Shear Blades, Lathe Spindles, and all kinds of Steel Forgings Made to Order.

REFINED BAR STEEL IN OCTAGON, ROUND SQUARE OR FLAT, MADE IN SIZES AND LENGTHS TO ORDER.

Miners' Drill Steel, Picks, Crowbars, Sledges, Hammers, Etc.

Chains all Sizes and Lengths Manufactured to Order. N. B.—Drill Steel, any Length from one to thirty feet.

OFFICE AND WORKS:

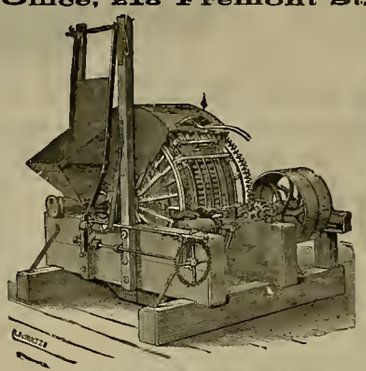
218 and 220 FOLSOM STREET, - - SAN FRANCISCO, CAL.

FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

[ESTABLISHED IN 1855.]

Office, 218 Fremont St., San Francisco



TUSTIN'S PULVERIZER.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer

WORKS ORE WET OR DRY.

ENGINES AND BOILERS

OF ALL KINDS,

Either for use on Steamboats or for use on Land.

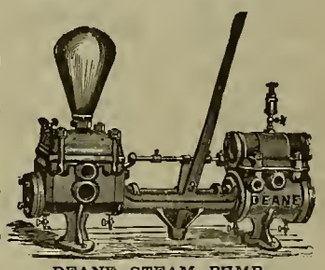
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries

OF EVERY DESCRIPTION.

Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.



DEANE STEAM PUMP.

SPECIALTIES:

Corliss Engines and Tustin Ore Pulverizers.

Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

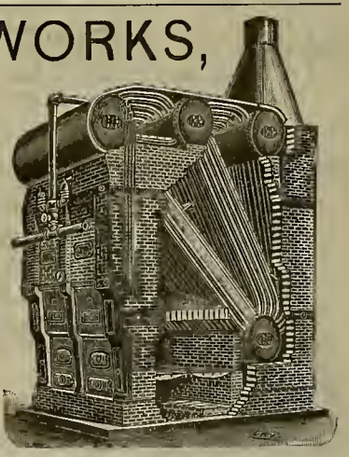
ATLAS IRON WORKS,

POTRERO, SAN FRANCISCO, CAL.,

BUILDERS OF

Mill, Mining, Street Railway AND Dredging Machinery,

PACIFIC COAST AGENTS FOR THE



Sterling Water Tube Safety Boiler,

Safest, Most Economical and Durable Boiler in the Market, Specially Adapted to Mining Purposes — Being Easily Transported over Mountain Roads.

THOMAS PRICE & SON,

Assay Office,

Sampling Works,

AND

NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES

For SAVING GOLD!

IN QUARTZ GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER

AT REDUCED PRICES.

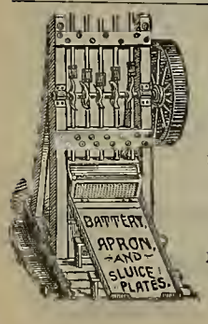
Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates Replated, Bought, or Gold Separated. THOUSANDS OF ORDERS FILLED.

SAN FRANCISCO NOVELTY, GOLD, SILVER AND NICKEL PLATING WORKS,
68, 70 & 72 First St., San Francisco, Cal.

☞ SEND FOR CIRCULARS.

JUSTINIAN CAIRE, Agent,
521 & 523 Market St., San Francisco,
—DEALER IN—
Assayers' and Mining Material,
—MANUFACTURER OF—
BATTERY SCREENS AND WIRE CLOTH.

Agent for HOSKINS'
HYDRO-CARBON ASSAY FURNACES.



IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD

In Quartz, Gravel and Placer Mining.

PRICES GREATLY REDUCED. ONLY REFINED SILVER AND BEST COPPER USED. OVER 3000 ORDERS FILLED. FIFTEEN MEDALS AWARDED. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated. These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Streets, San Francisco.

SAN FRANCISCO GOLD, SILVER AND NICKEL PLATING WORKS,

E. G. DENNISTON, Proprietor. 653 & 655 MISSION ST., SAN FRANCISCO, CAL.

Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper.
SEND FOR CIRCULAR.

RECEIVED EVERY MEDAL
Awarded on the Pacific Coast for Silver-Plated Amalgam Plates and Best Gold, Silver and Nickel Plating.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

AMADOR QUEEN.—*Ledger*, Oct. 22: Mr. Holland, who has had a crew of men at work in the Amador Queen No. 2 for two weeks, getting out a carload of rock to take to San Francisco, finished up the work Wednesday night and went below. The rock will be hauled to Ione, and shipped by rail as soon as possible. He proposes to give it a thorough test, and will, if the returns are satisfactory, in company with others, secure the property.

SUTTER CREEK.—All necessary preparations for sinking in the South Eureka are about completed. They are doing a little exploring at the 1500-foot level, which will be through by the 1st, then sinking will be in full blast. In the Wildman the air has been exceedingly bad for some time. The miners have been obliged to abandon work temporarily in consequence. Mr. Tregloan has had a new blower, much larger than the one previously used, sent from San Francisco. It is much more effective than the old one.

THE OUTLOOK.—*Record*, Oct. 20: The mining outlook in this section and county is certainly encouraging. As near as the *Record* is able to judge, it has not been more flattering for a number of years past. Sutter Creek people particularly have every reason to regard with satisfaction the condition of the mining industry in this vicinity, and unless all signs fail, our town is to enjoy more than usual prosperity in the future. The starting up of the Hector 40-stamp mill and the fine outlook in the underground workings of the mine, is a cause for congratulation. The Wildman mine, with its 30-stamp mill crushing steadily, under the capable management of Superintendent Tregloan, is an old standby and is upon a solid and permanent basis, which will continue to add its share toward keeping our beautiful little city in the front rank. As the *Record* has stated many times during the past two or three months, the South Eureka mine is rapidly developing into a valuable property, and its owners are sanguine that another season will see the mine turning out ore with a big mill erected for its reduction. The developments on the 500 level are entirely satisfactory, which is evidenced by the fact that sinking is to be resumed until another 500 feet is attained. Superintendent Tibbits is pushing ahead work as rapidly as possible with a small force of men at the Belmont mine. He is anxious to go to a greater depth, and doubtless the present favorable mining indications on all sides will encourage his company to inaugurate work on a more extensive scale. In connection with the mines, and also an important factor in the business welfare of our town, is the well-known foundry and machine shops of Knight & Co. This is one of the most extensive establishments of its character in the mining sections of California, and does much to encourage the development of mining, as every kind of machinery for that branch of industry is manufactured. The advantage of having that sort of work done under the eye and in the vicinity is an item not overlooked by men who make a business of mining. At our neighboring town of Amador City are the South Spring Hill and Keystone mines. Both of these properties are old dividend-payers, and they have done much toward keeping Amador on a level with its neighbors. The Kennedy mine, only a couple of miles from here, on the Jackson road, is one of the best gold mines on the continent, and is very good evidence of what the reward is for those who go down, down, down on the mother lode in old Amador. There are several good mining properties in this district lying idle, but doubtless they will be operated in good time. As at present situated, the people of Sutter Creek ought to feel pretty well satisfied with the outlook for the future.

Butte.

HUALETON MINE.—Oroville *Mercury*, Oct. 22: Some time ago Capt. Frary bonded the Phœnix quartz mine from the McMillan brothers, and has recently sold it to G. S. Colman of Chicago, and the gentlemen are all in town to-day to close the trade. During the past few months considerable development work has been done, and the ledge has proved remarkably rich. Mr. Colman will go to work on the property immediately, and will no doubt develop a rich mine. Capt. Frary is at work on other mines in the vicinity and will no doubt make more sales. W. W. Stow has a quartz ledge about two miles from Hurleton and has eight or ten men now developing the same. He is also building a road to the mine, and altogether the outlook for the mines about Hurleton is exceedingly bright.

Calaveras.

GOOD HOPE MINE.—Calaveras *Chronicle*, Oct. 22: Work is being actively pushed on the Good Hope mine, situated on the Mokelumne river about two miles from this place and owned by J. H. Jacobs & Co. There have been two tunnels run in on the lead for a distance of 60 feet, in both of which the rock shows well. Wednesday we were shown a piece of sulphuret rock that was taken from what is known as the "Pink Smith" shaft, that is said to be very rich. The rock was taken from a depth of 75 feet, at which point the lead was about 15 inches wide. The prospects are flattering for the development of a good piece of mining property.

El Dorado.

CANYON CREEK MINE.—Georgetown *Gazette*, Oct. 22: If the Caminetti Mining Bill becomes a law and hydraulic mining is resumed, capitalists stand ready to take hold and open the Canyon Creek mine, which will give employment to a large number of men.

NEVADA.

Nevada.

MURCHIE.—Grass Valley *Tidings*, Oct. 21: The Murchie mine has been bonded for $25,000. Parties are now at the property who will make arrangements to start up the mine shortly.

Siskiyou.

QUARTZ.—Yreka *Journal*, Oct. 19: Andrew G. Myers, the well-known mining man, who has an interest in an abandoned quartz ledge at Oro Fino, recently relocated, showed us a fine specimen of quartz from the ledge which contained solid gold in considerable quantity, and of bright yellow color. He took the specimen to San Francisco for exhibition, with the intention of also taking it to New York. From ten wagonloads of quartz crushed in an old arrastre, $300 was realized, but a single wagonload of the specimens shown would pay more than that, and it may be possible that a great amount of such quartz may be realized when the claim is better developed. Quite a large number of quartz claims is being located in the Siskiyou mountain foothills this fall, and by next spring, when the snow of winter disappears, there will be hundreds of miners employed in developing rich ledges. The rich strikes made by the Oregon Co. near Coles has caused many other Oregonians to come into our county and invest in mining property along the Oregon border. The Klamath river miners between Henley and Honolulu are now reaping a golden harvest, which will continue steadily until winter storms raise the river to drive them out.

Washoe District.

CONE, CALIFORNIA AND VIRGINIA.—*Chronicle*, Oct. 22: 1100 level—The west crosscut from the main north lateral drift, 315 feet north from the shaft station, has been advanced 30 feet; total length 288 feet; in porphyry and clay, carrying streaks of quartz. 1500 level—From the south drift at point of connection with the old stopes we continue to extract some ore and fillings of average milling value. 1600 level—We have continued prospecting upward from the old sill floor of the old stopes, from which some ore of fair quality is being extracted. 1650 level—Continued to extract some ore from the drift run east from the winze No. 3 (down 73 feet) in working upward from that point. Also some ore from the old stopes at the north end of the California ground. From the crosscut run west from the northwest drift we are running north in the old stopes and extracting some ore. 1750 level—Have continued to extract some milling ore in working upward from the sill floor in east crosscuts Nos. 1, 3 and 5 from the main south drift, and from the point where the upraise from the end of the drift run south from the end of the crosscut run west from the end of the main southwest drift connects with the 9th floor openings. Are extracting ore along the drift which connected this upraise (45 feet up) with the upraise 44 feet east. On the sill floor, at the bottom of this last-mentioned upraise, the south drift has been advanced 22 feet; total length 52 feet; in a quartz formation, carrying a low assay value. Have continued making repairs to the southwest drift. 1800 level—Along the south end of the drift running south from the crosscut run east from the winze No. 1 sunk from the 1750 level, we have continued to extract some ore from the sill floor upward of milling value. In stoping upward from the drift run south from the crosscut run east from the bottom of winze No. 2, down 45 feet, have extracted some milling ore. There has been extracted from all parts of the mine during the week 975 1830-2000 tons of ore which was shipped to the Morgan mill, the average value of which, per car samples, was $27.11 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $22.64 per ton per battery samples.

OPHIR.—1465 level—From the south drift, 101 feet below the sill floor of the 1465 level, from the Mexican into the Ophir ground, the west crosscut No. 2 has been advanced 19 feet; total length, 168 feet; in porphyry and clay carrying a little quartz of nominal value.

UNION CON.—900 level—The joint Union Con. and Sierra Nevada west drift has been extended during the week 25 feet; total length west from the joint shaft, 2534 feet. The face is in porphyry and small streaks of quartz.

MEXICAN.—On the 1465 level the west crosscut, started from the drift run north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level, near the south line of the mine, has been advanced 14 feet; total length, 168 feet, continuing in a hard porphyry formation.

UTAH.—340 level—The north drift from west crosscut No. 2 has been extended 18 feet; total length, 114 feet, continuing in porphyry, clay and quartz formation.

SIERRA NEVADA.—West crosscut No. 2, from Kenosha tunnel, started from north drift, 800 feet in, has been advanced 24 feet; total length 248 feet; face in black porphyry. Cedar Hill drift has a total length of 53 feet; the face is in porphyry. The intermediate tunnel between the Cedar Hill drift and Kenosha tunnel has been advanced 15 feet; total length 52 feet; face in soft porphyry. The joint Sierra Nevada and Union west drift, 900 level, has been advanced during the week 25 feet, making the total distance west of shaft 2534 feet; the face is in hard porphyry and small streaks of quartz.

ANDES.—On the 420 level, east crosscut No. 1 north was advanced 12 feet; total length 181 feet; formation porphyry and clay. This drift is being timbered as it is advanced.

GOULD & CURRY.—200 level—The northwest drift, started 435 feet from shaft, has been advanced 14 feet; total length 496 feet; face in hard porphyry. West crosscut No. 5, started in northwest drift, 432 feet from main west drift, has been extended 15 feet through porphyry and quartz; total length 41 feet. On the Sutro tunnel level, the joint north drift with Savage Co. has been advanced 25 feet during the week; total length 610 feet; face in porphyry.

BEST & BELCHER.—900 level—All work on this level during the week has been on repairs.

HALE & NORCROSS.—We continue retimbering main shaft above the 1000 level. Main Incline—Are making the necessary repairs. 1300 level—Are repairing the station at bottom of vertical shaft. 1500 level—Are repairing the incline station on this level and making other repairs. 1800 level—During the week advanced No. 1 west crosscut 13 feet; total length 75 feet; face in porphyry and quartz. West crosscut No. 2 on this level was advanced 12 feet; total length 58 feet; face is in quartz and porphyry. Advanced west crosscut No. 3 17 feet; total length 50 feet; face in porphyry. The west drift on the 150 level of the old or A-street workings was extended 4 feet; face in porphyry. The upper portion of the shaft for these workings was timbered during the week.

CHOLLAR.—We are making repairs on the various levels. The east crosscut, 160 feet south of north line, 930 level, is out 160 feet; face in soft clay and porphyry.

POTOSI.—The raise from No. 1 crosscut, 1100 level, continues in 2½ feet of fair-grade ore. Have started an east crosscut, 50 feet south of the Potosi winze, 1150 level; face in low-grade quartz. The southeast drift from bottom of Potosi winze, 1850 level, is out 169 feet; face in porphyry. The northwest drift from the 1800 station, Ward shaft, is out 988 feet; face in clay and porphyry. Extracted and sent to mill the past week 379 1900-2000 tons of ore from the 550, 1150 and 1300 levels. Milled during the week 400 tons. On hand at mill 57 1100-2000 tons. Average battery assay, $19.96. Average car sample assay, $20 69. Shipped to Carson Mint 384 pounds of crude bullion.

BULLION.—The north drift, from top of raise from east crosscut, 320 feet south of north line, 1300 level, is out 102 feet; face in porphyry and streaks of quartz. The joint southeast drift from the bottom of Potosi winze, 1850 level, is out 169 feet; face is in porphyry. The northwest drift from 1800 station, Ward shaft, is out 988 feet; face in clay and porphyry.

WARD SHAFT.—The joint Alpha and Exchequer east crosscut, 1800 level, has a total length of 40 feet; face in hard porphyry. The joint Potosi and Bullion northwest drift, 1800 level, is out 988 feet; face is in clay and porphyry.

EXCHEQUER.—The joint east crosscut on the north line of Alpha, 1800 level of Ward shaft, is out 40 feet; face in hard porphyry.

ALPHA.—The joint east crosscut on the north line of Alpha, 1800 level of Ward shaft, is out 40 feet; face in hard porphyry.

OCCIDENTAL.—From the stopes on 350, 400 and 450 levels we have extracted and milled 175 tons of ore of the average value of $18.40 per ton as per battery samples. The main north drift on the 750 level has been extended 8 feet; face in low-grade ore. The Zadig drift, Sutro tunnel level, has been extended 12 feet in hard porphyry.

NEW YORK.—The west crosscut, 110 feet north of shaft, 800 level, is out 43 feet; face in low-grade quartz. During the past week we have hoisted 77 carloads of ore from the 650 and 750 levels, that will average about $40 per ton.

SILVER HILL.—We are stoping out ore on the 160, 260 and 490 levels. Have extracted and sent to the mill the past week 195 375-2000 tons of ore. Milled during the week 195, 375-2000 tons of ore. Average battery assays, $19.76; average car sample assays, $23.01.

Ferguson District.

MAGNOLIA.—Pioche *Record*, Oct. 18: Monday's Helene stage brought up word of a new and very important strike which had just been made in the bottom of the Magnolia main shaft. The ore-body had been opened to a width of four feet and the grade is said to far exceed in richness the ore taken from the workings above. James Hutchinson brought up a number of large pieces which are said to range in value from $1000 to $5000 per ton in gold. The present strike is claimed to be the largest ever made in this State, and is more than encouraging to the purchasers of the mine.

THE APRIL FOOL.—Monday's *Lode* says the main shaft has now attained a depth of 112 feet. The south drift, started last week, has been run ten feet. This drift is for the purpose of crosscutting to the footwall, which has not yet been reached. The north drift is on the ledge. It has been run about ten feet in good ore. The No. 2 shaft has been sunk 25 feet in ore which averages very well. Two shifts are being worked on all parts of the mine, and prospecting is being pushed as rapidly as possible.

Pioche District.

THE YUBA.—Pioche *Record*, Oct. 3: A force of from 12 to 14 men is employed on this mine, strengthening the shaft timbers and otherwise putting the mine in good shape. How long the force will be retained is not known. The rumor of two weeks ago that the mine was to be leased has not materialized, and it looks as though the mine may lie idle for a time at least.

Pittsburg District.

THE MAYFIELD.—Virginia *Chronicle*, Oct. 21: Richard Kirman, from the Pittsburg mining district, Lander county, is owner of the Mayflower mine, half a mile above the Pittsburg, and has been working out there during the past five months. The gentleman has been engaged in building a road and fixing his mill, and has 14 men employed. He has a double Huntington crusher, which was moved to Mayflower from the Atlantic mill below Gold Hill. Mr. Kirman brought back many specimens of rock from the mine, some of which are speckled with native silver and assay 116 ounces to the ton. The ore is free-milling chloride. Mr. Kirman is elated over his prospects, but will not start the mill until next spring, owing to the price of silver.

COLORADO.

YANKEE GIRL.—Denver *Mining Industry*, Oct. 20: The Yankee Girl of Ouray county, during its past fiscal year, sold 4083 tons of ore, which averaged $36.12 per ton, and the net result was a loss of $33,596.50, or $8.22 per ton. To meet the loss and provide for the future, the company issued $50 000 in bonds. The mine is looking better than it has for a year, and gives promise of again becoming a profit-payer. A new discovery of rich ore has been made near the surface, about 200 feet from the shaft northeast toward the Guston, and it promises to yield well.

WORKING over dump-piles is one of the regular occupations in Colorado. One of the latest ventures of the kind is the Guston dump of Ouray county. It yielded $40,000 net.

THE following statement from the report of a committee we copy from the *Mining Industry* as showing the effect of the low price of silver: Number of mines closed down in San Juan county, 18; number of men thrown out of employment, 595; number of mines that reduced their forces, 6; number of men thrown out of employment thereby, 268; total number of mines affected, 24; total number of men disemployed thereby, 863.

PITKIN COUNTY.—Aspen *Sun*: The Durant tunnel will be completed about the 20th of this month. It is to be supplied with the finest electric plant in the State. There is an unusual quantity of ore now being shipped from the Aspen contact. Nine four-horse teams are now employed hauling ore from the mines. At a depth of 200 feet it is intended to crosscut and drift to catch the contact. All the ground above the tunnel level, a distance of 250 feet to the surface, in the Leadville mine is to be let under contract. Manager Yeckel says that the shaft is being sunk at the rate of about 4 or 5 feet a day, and it will be pushed down 200 feet more, when it is intended to strike the contact by crosscutting.

RICH MINE.—Aspen *Times*: The Mollie Gibson is displaying her jewels again this month, and is marketing some of the richest ore that ever studded the earth. It is no longer a question of capacity with this bonanza that has thrown the sensational records of all the past into obscurity, but simply how much will be thrown upon the market in its present depression. It is as possible for the mine to produce a half-million a month for an indefinite period as it is to produce a hundred thousand. The fortunate lessees of the Eva Belle sent down a certificate of their prosperity yesterday in two wagonloads of high-grade ore.

GILPIN COUNTY.—Gilpin County *Observer*: The lessees on the Nottaway are drifting and stoping at a depth of about 125 feet, and have opened up a body of mill dirt nearly two feet wide at a point about 65 feet east of the shaft, together with 18 inches of smelting iron. The mill dirt averages four ounces of gold and makes 2500 pounds of tailings worth $20 a ton, and the smelting-ore sells for from $60 to $80 a ton net.

HINSDALE COUNTY.—Hinsdale *Phonograph*: There has been much discussion as to the value of a dozen sacks shipped by express to Denver recently. Mr. Yankee says that the sacks weighed 1020 pounds gross, or a net of just half a ton within two or three pounds. The value was at the rate of over $10,000 per ton, the owners of the Golden Fleece receiving $5000 odd for the half-ton, and after all expenses were deducted, including the express charges of 3½ cents per pound, it gave net returns of $2562.

BOULDER COUNTY.—Boulder *Herald*: There has been wonderful activity in mining in Boulder county during the past year; numerous sales have been made of properties that have been lying idle for many years. A new mining camp has sprung into existence, which has furnished employment to hundreds of men, and other unprospected localities are now being filled by miners digging over the mountainsides in quest of gold and silver. The Nelly Bly shaft is 40 feet deep, well timbered and producing a grade of fine gold-quartz. An assay made from the concentrates last week in Denver gave $1947 per ton, while the general character of the mineral is of good grade.

RIO GRANDE COUNTY.—Creede *Chronicle*: The daily shipments from Creede mines continue in excess of those of same dates in preceding months. Fourteen cars were in the ore-train on Thursday, carrying 224 tons. On Friday the Rio Grande ore-train from this camp consisted of 17 cars containing 272 tons of Bachelor mountain ore. The Pueblo smelters receive the greater portion of the ore sent from Creede, and the mining men and speculators can verify the *Chronicle* figures by comparison with smelter receipts. Sixteen carloads went down on the ore-train last night, a majority of the cars containing 20 tons. Five cars contained rich sulphides from the Last Chance. The Amethyst mine will ship ore enough this month to break the past monthly record of the camp, while the Last Chance and other properties will swell the amount to such an extent that the mining world will scarcely believe that it is possible, considering the infancy of the camp.

IDAHO.

MINE AND MILL.—Idaho Springs *Gazette*, Oct. 15: Notwithstanding the low price of silver, the monthly output of the mines in this camp is on the increase. The Hot-Pot mine, at the head of Virginia canyon, now being worked by Fish, Boyd & Co., is producing a very good grade of smelting ore, besides large quantities of mill dirt. Across the canyon, east from the mine is the Lake, which is worked entirely by leasers and with good paying results. Engberg & Co. milled a car of very good ore from there last week, and the other leasers have a car or more on the dump ready for shipment. East of the Lake we find the Comstock and Dove's Nest, both in good ore. The West Santa Fe, owned and worked by the Fortunatus M. Co., under the management of John Trathen, is coming rapidly to the front as a dividend-

payer. The East Santa Fe, owned by Beach, Davis & Co., is being rapidly developed, and will in a short time be one of the best mines on the hill. Near there is the C. T. Minott, a new discovery by Jim Redd, which shows good pay at surface. A recent shipment ran well in gold and silver. A surface cut has resulted in demonstrating that it is the top of a good ore chute. At the east end of the cut he has sunk a shaft 15 feet, in both ends and bottom showing a streak of smelting ore from six inches to over a foot in width and worth about $5 a sack. In the east end a solid streak of chloride delights the eye and indicates a rich body going east. The balance of the vein is mill dirt that pans well. The shaft is being timbered, preparatory to extensive work. The crevice is very soft so far. The boys take out about 15 sacks a day. The Sun and Moon, operated by Johnson & Co., is producing some nice ore, mostly gold. Drifting and stoping is in progress, the water making too rapidly for sinking with a whim. The shaft is 160 feet deep. The Cincinnati, worked under lease by Pendar & Morgan, is turning out from two to three carloads of good ore per month, furnishing employment to 18 men. Riley Bros. are working the Franklin, west of the Cincinnati, and the outlook is very encoureging. Farther to the west, across the gulch, is the famous old reliable, the Gem, which continues her usual output of 10 or 12 cars of copper ore per month. Leasers on the Gem Extension have encountered a large body of ore of similar character to that of the Gem and are shipping it with very good results. South of the Gem Extension lies the Tropic, which is now worked for all she is worth and bids fair to surpass herself in her production of the palmy days of '79–'80. Just below the Tropic is the Pine Shade, with a record for production reaching into the thousands, and is still doing the elegant in good shape. Just below is the Silver Queen, which has produced ore that milled $68,000 per ton. This mine is being worked in good shape. The handsome and commodious shaft and orehouse is an ornament to Seaton and contains all the best mine equipments, including a boiler and engine that work smoothly. Recently a large body of smelting ora and mill dirt was encountered in the breast of the lower level, 40 feet east of shaft. A large vein of water broke in at tha sama time, necessitating a suspension of drifting for the time. Stoping is now being done. A fine-looking lot of smelting ore is being cobbed. What the mine needs sadly is a stampmill on the ground to treat the mill dirt, of which there is a large body, but the most of tha value of which is now used up in transportation and mill charges. The Silver Queen is a mina of great promise.

OREGON.

RANDOLPH MINES. — Bandon *Recorder*: Dr. Haesen, an old soldier, of Nebraska, and Mr. Souloa, of Seattle, Wash., capitalists, will start work near tha old Lane black sand mine, back of Randolph, using General Buell's process of separating the gold from the sand. Experiments so far have proved tha value of the process, and preparation for work on a larger scale is being made. The company has started in to put up a building 20x40 feet, and will construct six tanks, with a capacity of 15 tons each, in which to operate upon tha sand. Fahy's mill started up this week and will cut the lumbar to ba used at the mines. If the venture proves entirely successful it will make lively times in this part of Coos.

THE LA BELLEVUE.—*East Oregonian:* Reliable information concerning the Cabell mine deal has been given this paper. The sale was arranged through Cashier Parkar of tha First National Bank of Baker City, who, togethar with D. P. Thompson, is interested with the Cabell Bros. in the property. Tha purchase was mada by an English syndicate of Butta, Montana, and the Wide West mine, owned by Lucas & Flahirty, was also bought. The deal will not be completed until patants are obtained for tha several claims comprised in thesa properties, and the syndicate has agreed to bear tha expense of patenting and to allow the present owners to continna in charge of the mines until tha titles ara perfected, when cold cash will be paid, the purchase to ba consummated within 90 days. The Wide West sold for $20,000. The consideration for the Cabell property is unknown. The mine was held at $250,000.

BAISLEY-ELKHORN.—Bedrock *Democrat*, Oct. 17: Mr. S. N. Mahan, millwright, who has finished his labors in the construction of the new mill of the Baisley-Elkhorn Mining Company, arrived in the city yesterday. Mr. Mahan informad the reporter that the mill was to be started yesterday morning. The plant, Mr. Mahan says, is one of tha finest in tha northwest and has a capacity of 65 tons per day.

HURDY GURNY M. Co.—Tha mill plant of the Hurdy Gurdy Mining Company, with property at Elkhorn mountain, was to have started up yesterday morning. Tha mill is a small one, but will be abla to do effective work, as tha ore recently uncovared in the Hurdy Gurdy is said to be extremely rich in gold.

QUARTZ CRUSHER.—Grant's Pass *Courier*, Oct. 20: Messrs. Taylor and Ezell ara making arrangements to erect a Thorn quartz crusher at a point on Williams creek convenient to Black Oak, Trio, Terminus and Ezell quartz claims. Doc Taylor went to Portland last week for tha plant, which will cost in the neighborhood of $6000. Tha crusher will be operated by water-power and will run day and night. The Thorn crusher is capabla of crushing ora as low grade as $2 to tha ton at a profit, and thera are thousands of tons of rock in sight which assays from $15 to $20. Some 25 men will be employed on the worke when tha plant is in poeition and it will be a big thing for the mining interests in that part of Josephine. Tha location of tha works is about 17 miles from this city, on Farrie gulch. A chlorination works will be erected in connection to disposa of the concantrates.

Market Reports.

Financial and Commercial Review.

SAN FRANCISCO, Oct. 27, 1892.

General trade the past week was interrupted by the Columbus festivities. The tenor of advices indicates an enlarging demand, hut no decided enlargement in firm orders. The spirit of conservatism, which has been the characterizing feature of trade the past year, still continues. Traveling salesmen, as a rule, state that consumers are huying more freely. If this is correct it will he only a question of time when all branches of trade will feel its revivifying effect, and in this ironworkers ought to share. The greatest drawback is claimed to he the exorhitant freights from this city to consumptive or distrihutive points on this coast. Eastern mail advices report a steadily growing demand for goods, which causes a freer movement than has been witnessed for all of three years past. The increasing trade is being heneficially felt hy all manufacturing industries.

In the local money market there is a continued good demand for funds from commercial hanks, hut from savings hanks the call is sluggish, owing to there not heing any decided movement in real estate, and also in improvements, more than usual. Remittances from the interior are only fair, but they are in excess of the demand for crop purposes. As for the latter, the call is ahout over for the season. The two holidays in next month, which will he followed hy the usual midwinter holidays, are having some effect on the market, and until they have passed it is hardly reasonahle to suppose that either finance or trade will resume their normal conditions, particularly with large sums of money to he called in for the usual dividend and interest dishursements in January. At the East, the money centers report a fairly active call for funds, hut with no friction apparent. A leading financial paper in New York says that the interior States ahsorhed and retained more money from last year's crop movements, to meet this year's requirements, than ever hefore, and in consequence there have heen less violent fluctuations in Eastern money centers; less anxiety as to the adequacy of the currency supply; less dependence on the Government, and no expedients for dishursing unusual amounts at the time when currency requirements are greatest. The Treasury, with a reduced halance, has met the needs of the season this far quite as readily as in any of the years when, with a large surplus, unusual means are employed for dishursing large amounts at the time of active currency demands.

Another important factor is at work in promoting a general ease in the money centers at the East, viz., an increasing demand ahroad for American securities. Leading New York hankers have executed several large orders, which is accepted as one of the first hright rays in the foreign situation that has been visihle for some time past. This is one of the many directions in which gradual improvement of the financial situation is to he noted.

The International Monetary Conference, which meets at Brussels on November 22d, attracts increasing attention. Prohahly the near approach of the time for convening is largely due the fact that the silver prohlem or question was early lost sight of in the present presidential election. This absence has contrihuted largely to the advantages of himetalism, for, as a leading Eastern exchange says, it would have heen most unfortunate, so far as the prospects of the approaching Monetary Conference are concerned, if the silver question had become one of active controversy in this country just now. Enough has been shown hy the declarations of the political platforms to establish the fact that this country is alive to the silver question, and that independent action will he taken if international negotiations fail. It was not to be supposed, in view of the strength shown hy the silver faction in the past, that more than this could be accomplished in advance of the meeting of the Conference. The meeting will now he held with the knowledge that a time has come for action, and that changes in the policy of great nations, and affecting the interests of all nations, are to he expected whether the Conference succeeds in reaching an agreement or not.

The usually well informed Washington correspondent of the New York *Commercial Bulletin*, writing on the monetary conference, says that Senator Jones and ex-Comptroller Cannon will leave for Europe on November 10th, and the other American delegates will leave two days later. The correspondent further says:

It seems to he settled that Mr. Edward O. Leech, the Director of the Mint, will accompany the American delegates as their statistical and financial expert. The mint directors of England, France and Germany will be at the conference as delegates, and Mr. Leech was not anxious to go in a less distinguished capacity, hut the eagerness of the President and of the Secretary of the Treasury have prevailed over his disinclination. He has had his clerks husy on the statistics of the money circulation and the coinage of the world, with the varying relations of gold and silver under different laws and in different epochs, and will he able to furnish the delegates instantly with any particular fact or figures which they desire. One or two clerks familiar with French and other foreign languages will prohahly he sent along from the State Department to assist the American delegates in keeping their records and preparing papers. As the conference comes nearer, and the attitude of the hanking community of Europe hecomes hetter understood, illusions are heing dissipated, and the conviction is growing that the chances are none too hrilliant of substantial results. The question is very likely to arise early in the proceedings, what the United States is willing to concede to the great European powers if they will open their mints to silver or adopt measures for its wider use. Our delegates may he hrought face to face at an early date in the gathering with a proposition to make some hig tariff concessions hy way of reciprocity for the opening of European mints. The articles on which concessions are most likely to be asked, if they are asked at all, are manufactures of cotton, wool and silk. It will be a prohlem hig with significance for the future of our politics, as well as our finances, if a majority of our five delegates send word to the President and Cahinet that the larger use of silver hy the nations of the world can he ohtained hy liheral tariff concessions. It is idle to speculate how such a proposition would he received when it has as yet heen only hinted at, and its reception may vary according to the result of the National election. It is not heyond possihility that Senator Allison, of Iowa, would join the two Democratic delegates, Professor Andrews and Governor McCreary, in favoring a reciprocal arrangement of this sort, even if Mr. Cannon and Senator Jones were opposed to it.

SILVER—The market has held strong, with slight fluctuations, throughout the past week. The markets at home and also ahroad act very much as if the manipulators of silver have no regular defined policy and will not have any until the Monetary Conference meets, and a general idea is had regarding the prohable result. The heavy purchases hy the United States, and an increasing demand from silver-using countries, are strengthening the markets irrespective of what action will he taken hy the conference. The last steamship for China took out $85,000 in hullion for Japan.

MEXICAN DOLLARS—Exports by sea the past week aggregate as follows: To China, $656,507. The market has hung around 68¼ cts.

QUICKSILVER—Receipts the past week aggregate 666 flasks. The market is stronger in sympathy with an improvement ahroad.

ANTIMONY—The market is steadier, in sympathy with New York, which is reported to he hardening under a concentration of stocks.

LIME—Receipts the past week aggregate 4232 hhls. The market is essentially unchanged.

BORAX—Receipts the past week aggregate 740 ctls. and exports hy sea 3080 ctls. to New York. This shipment went hy P. M. S. S. Co. via Panama, which indicates lower freights.

PIG LEAD—The market is slow and in huyers' favor. New York mail advices report that consumers are standing for low prices, in view of the fact that the production is in excess of the demand.
